1. In the recovery of oil from an underground reservoir by a process involving combustion of a portion of the oil in place, wherein the reservoir stratum, at a known depth and of known thickness, contains materials having magnetic properties susceptible to being altered by the heat of the combustion process, and wherein the rate of oxygen supply to a combustion front in said stratum must be maintained above a minimum value per unit of front area to secure propagation of said front therethrough in a stable manner, the improvement comprising, in combination, the steps of making at the earth's surface an initial set of measurements of the earth's magnetic field intensity along a plurality of profile lines extending across at least the surface area overlying the portions of said stratum to be subjected to combustion, initiating a combustion front therein and maintaining combustion in said stratum by supplying an oxygen-containing gas to said

front through at least one oxygen-input well penetrating said stratum, remeasuring at intervals the earth's magnetic field intensity, and determining and plotting the differences between the initial and the remeasured values of said magnetic field intensity so as to show in several directions around said input well the positions of the boundary of the burned-out zone, noting said boundary positions, and adjusting, on the basis of said re-measured values, the rate of injection of said oxygen-containing gas into said input well so as to maintain the rate of oxygen supply to said front at least equal to said minimum value per unit of front area.

## SAND CONSOLIDATION

Roscoe C. Clark, Jr., Midland, Tex., assignor to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

No Drawing. Application June 25, 1954, Serial No. 439,499
4 Claims. (Cl. 166—33)

1. A method of producing a well which includes the step of consolidating the loose sands of a fluid-producing formation penetrated by said well, said consolidating step comprising obtaining samples of said sand, applying to one sample a mixture of a resin-forming liquid and oil acting as a diluent therein, to determine whether the resin of said mixture will combine with and coat the particles of sand and the diluent will occupy the interstices of the sample or vice-versa, applying to a second sample a mixture of said resin-forming liquid and water acting as a diluent therein, to determine whether the resin of said mixture will combine with and coat the particles of said sand and the diluent will occupy the interstices between the particles or vice-versa, injecting into said formation that mixture of resin-forming liquid and diluent which combines with the sand particles so that the resin coats the particles and the diluent occupies the interstices between the particles, whereby the particles of sand in said formation are wetted only by said resin-forming liquid, maintaining said mixture in place in said formation while said resin-forming liquid solidifies, and producing fluids from said formation into said well to remove said diluent and leave the formation surrounding said well consolidated and permeable.

2,770,307

## PARAFFIN REMOVAL PROCESS FOR OIL WELLS

Thomas J. Deardorff, Loveland, Tex., assignor, by mesne assignments, to Paraflow, Inc., a corporation of New Mexico

Application June 1, 1954, Serial No. 433,567
7 Claims. (Cl. 166—21)

1. A method of removing deposited paraffin accumulation from the well tubing and pump rods of pumping oil

wells which comprises sequentially forcing layers of an emulsion breaker, a lubricant gasses and hot oil down the well tubing thereby removing the encrusted paraffin from the well tubing and pump rods and depositing a lubricant coating on the well tubing, agitating the mass formed by the successive layers during their passage down the well tubing by reciprocating the pump rods.

2,770,308

## BOREHOLE APPARATUS OPERATED BY THE WELL FLUID

Dean F. Sauerwein, Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Delaware

Application August 11, 1954, Serial No. 449,231
3 Claims. (Cl. 166—65)

1. Borehole apparatus comprising a housing adapted to be passed through a borehole containing a column of liquid, a fluid chamber in said housing, means for applying the hydrostatic pressure of said column of liquid to the fluid in said chamber, a tank in said housing filled with a low pressure fluid, a cylinder in said housing containing a piston, first valve means in a first channel connecting said chamber to said cylinder on one side of said piston, second valve means in a second channel connecting said tank to said cylinder on the other side of said piston, third valve means in a third channel connecting said chamber to said cylinder on said other side of said piston, fourth valve means in a fourth channel connecting said tank to said cylinder on said one side of said piston, means for opening and closing said first and second valve means simultaneously, and means for opening and closing said third and fourth valve means simultaneously.

---

2,770,309

## DIRT GUARDS

Albert J. Whitehead, Bradford, Pa.

Application April 19, 1955, Serial No. 502,153
16 Claims. (Cl. 166—65)

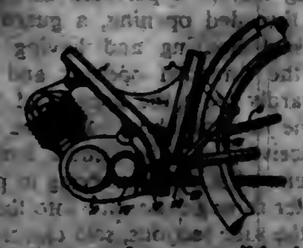
1. In a control for a well pump, a casing, a switch and actuating mechanism for the switch in said casing, a string of tube sections coupled in end-to-end engagement with each other and being of a length to extend to the top of a well in which the casing is disposed at the bottom of the well; and a dirt excluder between said casing and the bottom tube section, said dirt excluder comprising a vertically disposed cylindrical housing, couplings connecting ends of said housing with the lower tube section and the upper end of said casing, the lower coupling having therein a partition formed with a centrally located threaded opening, a guard tube disposed vertically in said housing and having its lower end screwed into the threaded opening and its upper end spaced downwardly from the upper end of the housing, space within the housing about said tube constituting an annular dirt-receiving chamber, and a temporary closure for the upper end of said tube serving to prevent passage of foreign matter through the tube into the casing during assembling of the tube sections, said closure being formed of frangible material adapting it to be ruptured by a conductor passed downwardly through the string of tube sections into the housing and through the tube therein.

---

2,770,310

## POWER PROPELLED HAND TRUCK

Joseph Harold Gates, Glendale, Calif., assignor of one-half to Dale Gates, Albany, Ind.



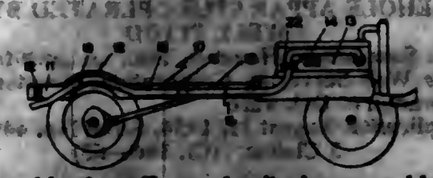
Application February 19, 1953, Serial No. 337,726
3 Claims. (Cl. 180—19)

1. A carrier including, an elongate frame, and two individually shiftable supporting means connected to the forward end portion of the frame and shiftable relative to each other and each shiftable relative to the frame to be selectively and individually employed to support the frame, one of said supporting means being an elongate tractor type supporting means including, an elongate carriage, legs fixed to and depending from the forward and portion of the frame, the forward end portion of the carriage being pivotally carried by said legs on a horizontal

axis extending transversely of the frame, adjustably extensible links connecting the frame to the rear end portion of the carriage, there being fasteners for selectively locking the links to secure the rear end portion of the carriage against movement vertically relative to the frame, rollers journaled in each end of the carriage, endless flexible ground engaging members carried by the rollers and extending lengthwise of the carriage, the other said supporting means being a wheel type supporting means including, a pair of spaced arms, and a pair of ground engaging wheels journaled in the forward ends of the arms, the rear ends of the arms being pivotally carried by the frame on an axis extending transversely thereof, the wheels being carried on a common axis to shift with the forward ends of the arms to move vertically relative to the frame and relative to the tractor type support at the forward end of the frame and into and out of position where they are below the tractor type of support at the forward end of the frame, and a pin engageable between each arm and the frame for selectively securing the arms and wheels against movement vertically relative to the frame.

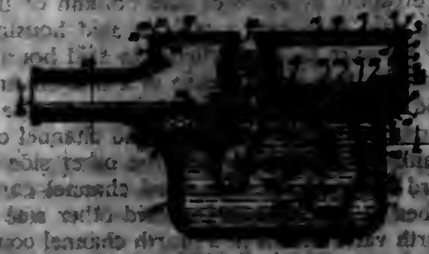
2,770,311
LIGHT MOTORCYCLE CONVERTIBLE TO ENGINE-ASSISTED PEDAL CYCLE AND VICE VERSA
Alfred Krettler, Stuttgart, Germany
Application June 23, 1954, Serial No. 438,709
Claims priority, application Germany June 26, 1953
5 Claims. (Cl. 180—33)

1. In a light motorcycle convertible into an engine-assisted pedal cycle, a cycle frame carrying a front and a rear wheel, a unitary crankcase and gearbox assembly having a recess in one side thereof, a first shaft rotatable in geared relationship to said engine and having one end portion within said recess and its other end portion carrying a first chain-wheel with first means for driving said rear wheel, a freewheel chain sprocket engaging said one end portion of said first shaft and a kickstarter chain having one end attached to said sprocket, if used as a motorcycle only, said cycle frame having a bottom bearing, a footrest bar mounted in said bottom bearing and a kickstarter lever attached to the other end of said kickstarter chain and mounted for partial rotation coaxially with said footrest bar, said footrest bar and said kickstarter lever being adapted to be replaced by a second shaft carrying pedal cranks and a second chainwheel with second means for driving said rear wheel, in order to convert said motorcycle to an engine-assisted pedal cycle.



2,770,312
SEISMIC WAVE GENERATION
Donald Stevenson, Tulsa, Okla., assignor to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware
Application September 11, 1953, Serial No. 379,994
9 Claims. (Cl. 181—.5)

1. Seismic surveying apparatus comprising, in combination, an elongated explosive charge comprising a plurality of segments of explosive material placed end-to-end in a bore hole opposite an earth medium of seismic wave propagation velocity V, alternate segments of said explosive material having a detonation velocity $V_1$ less than V and the remainder of said segments having a detonation velocity $V_2$ greater than V, the sum of lengths of any two adjacent segments being chosen to provide

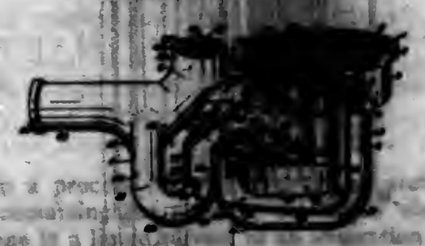


an average detonation velocity therethrough approximately equal to V, means for initiating detonation of said charge at one end thereof, and means spaced from said charge for receiving and recording the resultant seismic waves after travel through the earth's subsurface.

2,770,313
COMBINATION TAIL PIPE AND MUFFLER
Samuel G. Johnson, Fort Wayne, Ind., assignor to International Harvester Company, a corporation of New Jersey
Application January 19, 1953, Serial No. 267,248
7 Claims. (Cl. 181—41)

3. A combined muffler and tail pipe assembly for internal combustion engines comprising a single rigid, gas-impervious pipe of uniform diameter throughout its length extending from the exhaust manifold of the engine to the area where the exhaust gases are expelled to the atmosphere; a single flexible conduit disposed within and immovable with respect to said pipe for conducting the exhaust gases from the engine to the atmosphere, said conduit being formed to partially define a plurality of means spaced between said conduit and said pipe for allowing the exhaust gases to expand, said means being disposed along the entire length of said conduit and each means being spaced from an adjacent means a distance less than the diameter of said pipe.

2,770,314
FLOOR DRAIN
Paul R. Powell, Kansas City, Mo.
Application November 3, 1954, Serial No. 466,567
2 Claims. (Cl. 182—14)



1. A floor drain including a casing having a flow passageway therethrough from a drain inlet in said casing to a drain outlet on a side of the casing remote from the drain inlet, said casing having a part depending from

vicinity of said passageway to a point below the outlet for holding a seal with a body of water trapped in the passageway to prohibit sewage gases from escaping through the drain inlet side of said depending part of the casing, the drain outlet side of said depending part of the casing having an upper drain compartment and a lower valve compartment within said passageway, said partition having an opening therethrough, a backflow control valve having an annular plate portion closing said opening and having a depending duct portion extending downwardly through said opening and terminating in an outlet below the level of the outlet of said casing, means forming a valve seat in the passageway at the outlet side of said depending part of the casing and at a level below said outlet of the casing, means forming a valve seat on the outlet of said duct, and valving members on the outlet side of said seat forming means and arranged to open in the direction of flow from the drain inlet to the drain outlet and to seat in case of backflow from the outlet of the casing in the direction of said drain inlet.

2,770,315
DRAIN WITH VALVED TRAP
Paul R. Powell, Kansas City, Mo.
Application January 7, 1953, Serial No. 330,061
1 Claim. (Cl. 182—19)

A floor drain including a casing having a lower bowl portion and an upper drain portion, a back-flow type unit having a substantially vertical duct extending into the lower bowl portion and of a size relatively to said lower bowl portion for providing a substantial space therebetween, and having a laterally disposed terminal provided with a valved outlet into said lower bowl portion for passing liquid from the upper drain portion into the said lower bowl portion and for preventing back-flow of liquid to said upper drain of the casing, said vertical duct portion having a flange seated in the upper drain portion to close the space surrounding said vertical duct portion, said casing having an outlet between the level of the valved outlet and said flange for maintaining the level of the liquid in said bowl portion above the valved outlet, said casing having a part extending therefrom between the lower bowl portion and said outlet and terminating below the level of the valved outlet to form a liquid seal for establishing a dead-air space above the level of the liquid in the lower bowl portion for retarding surface evaporation of said liquid, and a partition extending upwardly across the interior of the casing between the valved outlet and the said part of the casing and terminating at a level between the valved outlet and the outlet in the casing to cooperate with the outlet in assuring a water seal over the valved outlet.

2,770,316
APPARATUS FOR COLLECTING AIR CONTAMINANTS
Jack T. Wilson and Robert J. Ryan, Milwaukee, Wis., assignors to The Louis Allis Company, Milwaukee, Wis., a corporation of Wisconsin
Application October 26, 1954, Serial No. 464,488
4 Claims. (Cl. 183—7)

1. An air testing apparatus comprising a housing having an inlet at one end thereof and an outlet at its other end, a fan for causing air to flow through the housing from the inlet to the outlet, and collector means in the housing upon which contaminants in the air flowing therethrough may be deposited to enable analysis of the nature and quantity of contaminants in the air at the location of the apparatus, said apparatus being characterized by the fact that the collector means comprises a holder in the housing having a stem in the housing extending in a

direction parallel to the flow of air from the inlet to the outlet and a plurality of spaced-apart finger-like projections radiating therefrom so as to be disposed transversely to the direction of air flow through the housing; and a woven fibrous sleeve readily removably fitted on each of the projections and impregnated with a non-volatile hygroscopic liquid.

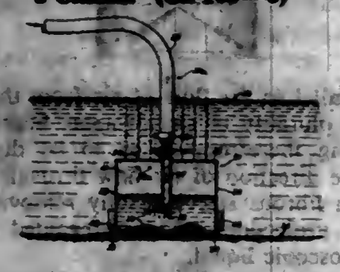
2,770,317
REFRIGERATOR DEHYDRATOR
Edward W. Bateman, Detroit, Mich.
Application October 1, 1953, Serial No. 383,534
1 Claim. (Cl. 183—4.9)

In a dehydrator adapted for placement in a refrigerating system to dehydrate a refrigerant and comprising a hollow casing having inlet and outlet means and a wire mesh bag containing a granular desiccant disposed therein, the improvement consisting of a spring wire positioned in a channel formed by folding and fastening the end of said bag, said spring wire being slightly bowed with the ends thereof engaging the inner wall of said container to firmly position said bag within said container and prevent movement of said bag relative to said container thereby preventing the powdering of said desiccant.

2,770,318
ODOR AND SMOKE CONSUMER
Kenneth F. Tilger, Huntington, Ind.
Application May 2, 1955, Serial No. 505,460
1 Claim. (Cl. 183—6)

An odor and smoke consumer adapted to be mounted in the smoke emitting line of a burner, comprising a series of perforated elongated sheet metal tubes extending transversely of the flow of gas through said line, said tubes being positioned in parallel spaced relation to each other with portions of one tube overlapping portions of the adjacent tubes to present a continuous intercepting surface to odor and smoke producing particles carried by said gas while permitting the flow of gas therebetween,

said a fuel conducting manifold having a plurality of burner nozzles extending in alignment with each said tube for directing a flame interiorly thereon to render it individually incandescent from within, whereby said particles will be consumed upon striking the exterior of said incandescent tubes and prevented from passing out of the flue.



---

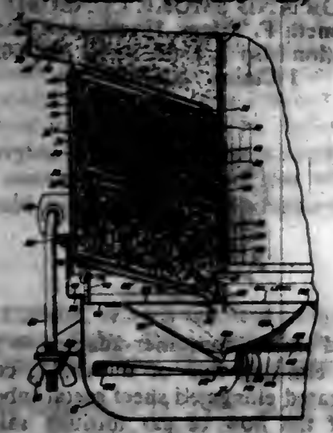
2,770,319

## DUST SEPARATOR

Ley D. Hagenbook, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois

Application August 5, 1954, Serial No. 448,634
5 Claims. (Cl. 183—9)

1. A dust separator completely immersible under liquid, said separator comprising a housing having side walls, a perforate top wall and an open bottom defining an air chamber, said housing being weighted to offset the buoyancy of air within said chamber when said separator is completely immersed under a liquid, an open-ended inlet pipe extending through the center of the top wall having one end thereof adapted for connection to an eductor hose bringing a mixture of dust-laden air from a source located remotely therefrom, the other end of said pipe terminating in a perforated portion disposed within said housing, an aspirator mounted in said pipe, said aspirator having the suction end thereof located outside the housing effectively inspiring liquid into said pipe responsive to the flow of dust-laden air therethrough to pre-mix liquid and dust-laden air within said pipe and the perforated end portion of said pipe being effective to further mix and facilitate settling of dust through the open bottom of the housing and the passage of dust-free air through the perforate top wall.



---

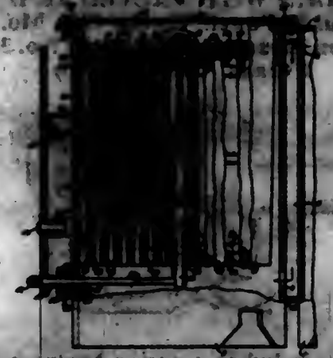
2,770,320

## OIL BATH AIR CLEANER

John J. Dreznes, Chicago, Ill., assignor to United Specialties Company, Chicago, Ill., a corporation of Delaware

Application December 19, 1952, Serial No. 326,973
7 Claims. (Cl. 183—15)

1. In a liquid bath air cleaner, a central intake air shaft, a housing surrounding the air shaft, the space between the housing and the shaft constituting a filter space chamber, the end of the housing opposite the intake end of the air shaft being provided with a removable cup, at least two, insertable cartridge positioned within the space, removably surrounding the air shaft, the cartridges having filtering intensities that increase from one cartridge to the next along the path of air movement through the filter space chamber, the cartridge relatively adjacent the removable cup being provided with a projection element so that the cartridges can only be inserted in the order of decreasing filtering intensity, the cartridges remote from the removable cup being provided with a depending collapsible member attached to the cartridge so that, after the lower cartridge has been removed, the collapsible member depends and constitutes a handle by which the cartridge may be manipulated.



---

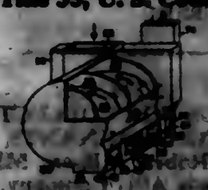
2,770,321

## AIR FILTERING APPARATUS

Raymond E. Bischoff, Chamblee, Pa., assignor to Mine Safety Appliances Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application June 24, 1954, Serial No. 438,953
15 Claims. (Cl. 183—69)

1. Filtering apparatus comprising an upright drum, a plurality of spaced concentric rings each in a horizontal plane in the upper part of the drum, a downwardly tapered filter bag in the drum having its larger end encircling the rings and sealed to the drum, the bag being telescoped up and down within itself between upper and lower folds to provide concentric filtering walls hanging down around and between the rings, the rings being disposed beneath said upper folds and supporting said walls, spacing members engaging the inner surface of the bag between said walls, a rod extending across the drum above the rings and supported by the drum, and means suspending the rings from the rod, the lower part of the drum being provided with an air inlet and the upper part of the drum being provided with an air outlet.



---

2,770,322

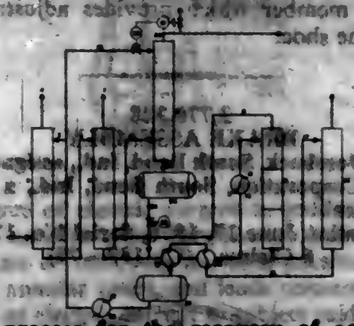
## SPARK AND FLY ASH ARRESTOR

James W. Bastian, Jr., Lansdowne, and William A. Fate, Jr., Springfield, Pa., assignors to the United States of America as represented by the Secretary of the Navy

Application May 20, 1954, Serial No. 431,364
2 Claims. (Cl. 183—68)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A spark and fly ash arrestor comprising a horizontally disposed spiralled outer wall having vertically spaced overlapping inner and outer edges providing an extended outlet in the lower portion thereof, a cylindrical inner wall providing an axial interior passageway with the outer

wall and an inner passageway, a compartment at one end of the housing interconnecting said passageways, a transverse strip within the annular space providing a helical path, a supply conduit in communication with the annular passageway for the admission of combustion products, means adjacent the other end of the housing for establishing flow of the combustion products through the helical path in the passageways and through the chamber and a lower compartment in communication with the extended outlet for receiving separated deposits from the flowing combustion products.



---

2,770,323

## ACETYLENE HANDLING

Theodore Breitmayer, Texas City, Tex., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Application February 15, 1952, Serial No. 272,282
4 Claims. (Cl. 183—115)

1. In a process for the recovery of acetylene from gases containing the same by selectively absorbing the acetylene in a liquid solvent in an absorption zone, withdrawing the acetylene-rich solvent from the absorption zone and passing it to a desorption zone where acetylene is released from the solvent, and recycling the solvent from which acetylene has been released for absorption of further amounts of acetylene, the improvement which comprises passing the released acetylene through a final column, provided with liquid-vapor contact means and connected to an auxiliary surge tank, where it flows upward countercurrent to a descending stream of solvent, automatically controlling the rate at which purified acetylene is produced from said final column by regulating the overhead pressure in such a manner that any increase in pressure results in an increase in solvent feed to the column to absorb the excess acetylene, the acetylene-rich solvent being passed from the bottom of said final column and stored in the connected auxiliary surge tank, and any decrease in pressure in the overhead line results in a consequent reduction in the solvent feed to said final column to permit additional purified acetylene to pass overhead.

---

2,770,324

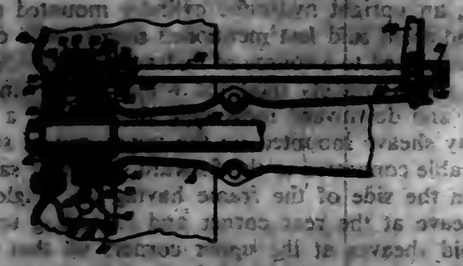
## SELF-LEVELING LIFT

Robert J. Peterson, Warren, Minn.

Application July 21, 1952, Serial No. 299,989
1 Claim. (Cl. 187—34)

---

2,770,325



## BRAKE AND ACTUATING MECHANISM THEREFOR

Edward K. Dornbeck, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application August 9, 1947, Serial No. 767,710
10 Claims. (Cl. 188—18)

1. For use on a vehicle having a rotatable brake drum and a non-rotatable axle housing, brake mechanism comprising a supporting plate secured to the axle housing, an anchor pin supported on said plate at one side thereof, said anchor pin extending toward the center of the vehicle, two brake shoes horizontally extending brake shoes mounted on said plate, said plate having outwardly extending arms which guide the webs of said shoes, said shoes hav-

ing adjacent separable end portions which engage opposite sides of the anchor pin in released position and which are arranged to anchor selectively during braking depending upon the direction of drum rotation, an actuating shaft which extends horizontally from the brake assembly toward the center of the vehicle, the end of the shaft which actuates the brake being flatted to provide two longitudinally extending legs which straddle the anchor pin and which rest on the end of one shoe, the legs being arranged when the shaft is rotated to exert a spreading force on the adjacent separable ends of the shoes, the end of the shaft remote from the brake assembly being journaled in a bearing provided by the axle housing and having sufficient play in said bearing to permit slight vertical swivelling movement of the shoe-actuating end of the shaft as the shoe ends shift toward or away from the anchor pin, and a lever arm carried by the actuating shaft which is adapted to be manually operated to apply the brake.

2,770,526
BRAKE MECHANISM
Robert W. Wertzen, North Riverside, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application August 3, 1950, Serial No. 177,471
5 Claims. (Cl. 188—78)

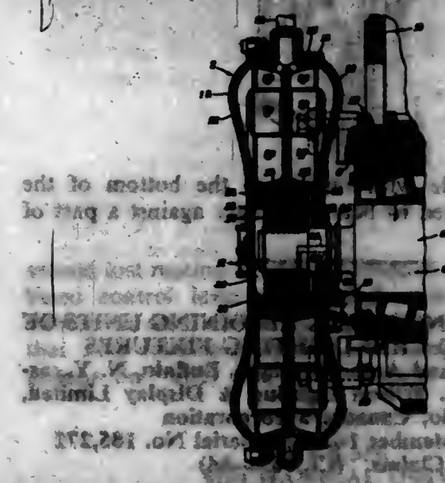
1. In brake mechanism, the combination of a rotatable toothed element, a sprag movable toward and away from the rotatable element and adapted to engage the latter, a manually operable control, a toggle linkage comprising two links having a pivotal connection at ends of each and one of said links being connected at its other end with said sprag and the other link being pivotally connected at its other end with a stationary member, a pin on said first pivotal connection, and a lever connected to be moved by said manually operable control and having surfaces defining a generally U-shaped opening on its end for receiving said pin whereby to move the pivoted links in one direction to engage said sprag on movement of said manually operable control in one direction and whereby to move the pivoted links in another direction to disengage said sprag and to disengage said slot from said pin on movement of said manually operable control in another direction.

2,770,527
BRAKE ASSEMBLY
William E. Wahl, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application September 13, 1950, Serial No. 184,974
9 Claims. (Cl. 188—78)

4. A brake assembly comprising a support member having two axially-spaced anchor projections, a brake shoe having a transversely-extending anchor pin supported on its anchoring end and arranged to engage simultaneously both of said projections, and a shoe-positioning member which engages the shoe at a point remote from its anchoring end which is so constructed as to

assist in laterally positioning the shoe web, said shoe-positioning member having an adjustable connection with the support member which provides adjustment of the position of the shoe.

2,770,528
BRAKE ASSEMBLY
Edward K. Dornbush, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application June 27, 1950, Serial No. 170,545
6 Claims. (Cl. 188—78)



6. For use on a vehicle having a rotatable drum and a non-rotatable housing therefor, brake mechanism comprising a torque-taking member adapted to be secured to said housing and being provided with a radially outwardly disposed pinion having axially spaced sides, an axially extending anchor member secured between said sides, two brake shoes carried by said torque-taking member and having adjacent separable end portions which anchor on corresponding side portions of said anchor member, and an actuating lever pivotally carried by said anchor member and having one arm operative to effect spreading of said separable end portions and having the other arm bent to project through an opening in said torque-taking member whereby this last mentioned arm may be rotated about said anchor member to cause said shoes to be forced into frictional engagement with the drum.

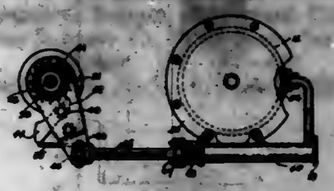
2,770,529
HYDRAULIC MAGNETIC FLUID BRAKE
William J. Casey III, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application July 26, 1952, Serial No. 300,942
7 Claims. (Cl. 188—90)

1. In a brake arrangement for a railway car truck having a journal box mounted on a truck frame, an axle having an extension integral and coaxial therewith and projecting outwardly from the journal box, a hydraulic torque converter including a casing extending axially coaxial with said extension and secured to said journal box,

sealed coaxial bearings formed of non-magnetic metal provided on the casing coaxial with said axle extension, a cylindrical sleeve formed of paramagnetic metal rotatably mounted on said bearings, an impeller secured on said sleeve to circulate liquid within the casing, a cylindrical housing formed of paramagnetic metal secured on said extension within said sleeve to define therewith an annular space, a coil within said housing to be energized

from a source of electric current to produce a magnetic flux in said annular space between the housing and said sleeve, a mass of relatively movable paramagnetic particles in said annular space, and leads connecting said coil to a source of electric current to subject said housing and sleeve and mass of paramagnetic particles to a magnetic field to produce a coupling force between said housing and sleeve.

2,770,530
BRAKING DEVICE
Cesar Jaques, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application July 5, 1952, Serial No. 297,238
Claims priority, application Netherlands August 18, 1951
6 Claims. (Cl. 188—90)



1. A liquid brake assembly comprising a vessel containing a filling liquid, a cylindrical sheath communicating with said vessel and comprising an aperture for supplying and discharging said liquid and an open conduit member interconnecting the interior of said sheath as a source of gaseous medium arranged exteriorly to said liquid, a trough-shaped member secured to a wall of the vessel and intimately engaging and supporting a portion of said sheath, said trough-shaped member having openings corresponding to and aligned with each of said apertures, a blade wheel disposed within said cylindrical sheath, and input power means for rotating said blade wheel, said input power means rotatably guiding said blade wheel at a speed to cause substantially all of the liquid in said sheath to be displaced by centrifugal action through said apertures and said openings whereby said blade wheel operates substantially in said gaseous medium at speeds at least equal to that of said normal rotation and at least a portion of said liquid at speeds below the speed of normal rotation, said portion of liquid exerting a braking action on said blade wheel.

2,770,531
BRAKE SLACK ADJUSTER
George B. Dewy, Westmount, Quebec, Canada
Application February 7, 1952, Serial No. 436,609
6 Claims. (Cl. 188—196)

1. In a slack adjuster for the brake leverage system of a railway car including a rod through which braking force is transmitted and a rotatable take-up device in said rod operable by rotation for varying the length of the connection and thereby compensating for slack in the system, a ratchet, lever and pawl structure for rotating the take-up device by rocking movement of the lever, the herein described improved means for rocking the lever including an operating lever swingable in a plane substantially parallel with the plane of swinging movement of the rocking lever, a bar pivotally connecting the respective levers, and a spring connecting the operating lever and bar and wholly carried thereby for moving the bar by changing the angular relation between the bar and operating lever.

2,770,532
PAWL RELEASING MEANS FOR A SLACK ADJUSTER
George B. Dewy, Westmount, Quebec, Canada
Application September 29, 1954, Serial No. 459,193
1 Claim. (Cl. 188—196)

In a slack adjuster for the brake leverage system of a railway car and the like having a take-up device operable by rotation thereof to vary the relation between certain parts of the system and thereby compensate for excessive slack in the brake parts and having a structure for rotating the take-up device to take up slack including a ratchet wheel fixedly mounted on the take-up device and a lever freely swingable on the take-up device, said lever having a pawl pivotally mounted thereon to provide a clutch connection between the ratchet wheel and lever when the latter is swung in a direction to take up slack and a declutched connection when swung in the opposite direction, said pawl being provided with a weighted extension to bias the pawl into engagement with the ratchet wheel, said structure including an operating link pivotally mounted on the lever for swinging the latter by movement of the link, the herein described improved means for releasing the pawl from the ratchet wheel at the completion of the take up movement and including an extension on the link lying beneath the weighted extension of the pawl and adapted to engage therewith at the completion of the take-up movement of the link to declutch the pawl from the ratchet wheel and allow free rotary movement of the take-up device in either direction.

2,770,250

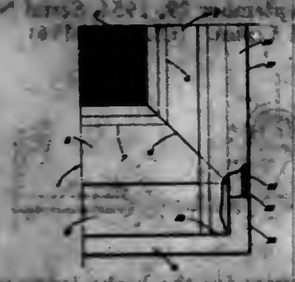
**BRAKE SHOE ADJUSTER AND RELEASE MECHANISM**

Robert F. Smith, Detroit, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware

Original application May 9, 1952, Serial No. 286,934. Divided and this application April 22, 1954, Serial No. 424,993

8 Claims. (Cl. 188—315)

1. In a brake assembly, a support plate, a brake shoe of the expanding type rockably mounted on said support plate, a rotatable cam carried by said support plate having portions engageable with said shoe to provide for adjustment of the shoe relative to said support, an anchor means carried by said support plate and spaced from said cam, a strut member extending between said cam and said anchor means, and a resilient element connected between said strut and said shoe.



2,770,334

**DOOR FRAME STRUCTURE**

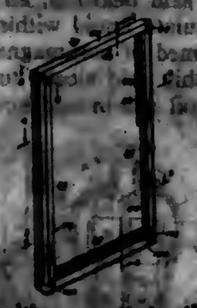
David Jordan Rust and Josh H. Jensen, San Leandro, Calif., assignors to Rylock Company, Ltd., San Leandro, Calif., a corporation of California

Application November 6, 1954, Serial No. 467,426

2 Claims. (Cl. 189—46)

1. In a metallic door frame having a horizontal bottom rail and a vertical stile extending from the lower inner corner of said frame; a vertical attachment post at the inner edge of the frame laterally adjustably secured thereto, said post lapping the front of the stile and the adjacent end of the bottom rail, and a horizontal shoe rail vertically adjustable in and depending below the bottom rail; the post including a vertical back wall, said back wall being notched at the lower end portion, and the adjacent end portion of said shoe rail projecting through the notch and terminating flush with the back edge of said post.

2,770,335



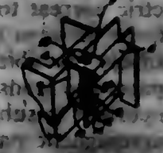
**WINDOW FRAME ASSEMBLY**

Joseph Sylvan, Bentley, Mich.

Application April 6, 1953, Serial No. 346,981

10 Claims. (Cl. 189—78)

1. A window frame assembly adapted to be received within a window opening and having a pair of jamb portions each being channel shape in cross section and each having the bottom of its channel shape disposed parallel to the plane of the frame and adapted to seat against an outer surface of an jamb portion defining the window opening and each having the outer side wall of its channel shape formed of resilient sheet metal and flared outwardly at an obtuse angle with respect to the bottom of the channel and adapted to bear yieldingly against a part of the jamb.



2,770,336

**MEANS FOR CONNECTING ADJOINING UNITS OF LOUVERED GRID LIGHTING FIXTURES**

James V. Vevirit and Anthony Giuffre, Buffalo, N. Y., assignors to J. A. Wilson Lighting & Display Limited, Toronto, Ontario, Canada, a corporation

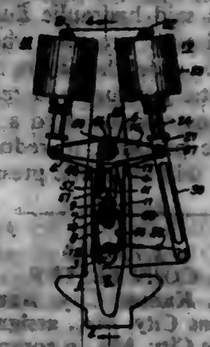
Application September 16, 1953, Serial No. 185,272

5 Claims. (Cl. 189—84)

1. In combination, a pair of louvered grid lighting units having adjoining walls, said walls having recesses in their adjoining surfaces intermediate their upper and lower edges, a portion of one of said wall surfaces facing towards a portion of the adjoining surface of the other wall, said facing surface portions being between the upper edges of the walls and the recesses, and a clip connecting said walls, the clip comprising a wall embracing portion connecting said walls and spacer means extending downwardly from said embracing portion between the walls, the spacer means being in contact with said facing surface portions thus spacing the walls a predetermined distance apart, each wall having a projection extending from the wall towards the adjoining wall, the projection having a rib that is spaced from, and that has a vertical surface facing, the wall from which the projection extends, said vertical surface defining with the wall the recess of the wall, and the spacer means fitting in said recesses against said vertical surfaces thus preventing spreading apart of the walls.

2,770,337

**DUAL CONTROL MECHANISM**

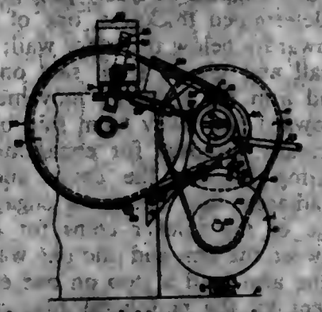


Edwin G. Hunt, Kalamazoo, Mich.

Application January 2, 1953, Serial No. 329,355

9 Claims. (Cl. 192—4)

1. In a combined control mechanism for a reversing clutch and a throttle valve, a clutch shaft, a combined control lever having a neutral position, a clutch control linkage coupled to said clutch shaft for positioning rotation of said clutch shaft, means thus coupling said clutch linkage to said combined control lever through a first lost motion coupling, an input end power booster having a valve control for actuating said power booster, means for connecting said power booster to said clutch linkage to actuate said clutch linkage, a valve linkage connected between said combined lever and said valve control, said valve linkage operating said valve control to actuate said power booster upon a movement of said combined lever from its neutral position by an amount less than that necessary to take up the lost motion in said first lost motion coupling, a throttle control member for controlling the throttle valve, a throttle linkage connected to said throttle lever for effecting movement thereof, a second lost motion coupling connected between said combined control lever and said throttle linkage, the lost motion in said second lost motion coupling being such that said combined control lever engages said throttle linkage only after said clutch linkage has been actuated.



2,770,338

**MECHANICAL DRIVE**

James H. Penney, Buffalo, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application January 30, 1953, Serial No. 334,153

9 Claims. (Cl. 192—11)

1. A belt drive comprising, a stationary support, a drive motor, means pivotally mounting said drive motor on said stationary support, a jack shaft pedestal secured to said motor and projecting upwardly therefrom, a jack shaft secured in said pedestal, a motor pulley secured to the shaft of said motor, a flywheel, a driving pulley connected to said flywheel, said flywheel and driving pulley being mounted on said jack shaft, a driven pulley mounted on said stationary support, a first belt connecting said motor pulley and said flywheel, a second belt connecting said driving and driven pulleys, said motor and pedestal tilting toward said driven pulley to loosen said second belt, a friction member, a lever movably mounting said friction member on said stationary support adjacent the portion of said second belt passing over said driven pulley, and a link connecting said lever with said pedestal to actuate said friction member by movement of said pedestal.

2,770,339

**LEVER HOIST**

Orrie E. Dotson, Lisbon, Ohio, assignor, by mesne assignments, to The Allen Plastic Mold and Die Company, Cuyahoga Falls, Ohio

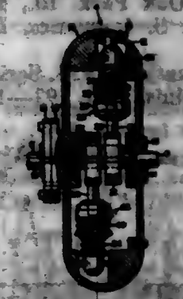
Application March 30, 1953, Serial No. 345,656

5 Claims. (Cl. 192—16)

1. In a lever hoist, a hollow body member having oppositely disposed aligned openings, a driven shaft located therein and journaled therein midway between said openings and in one of said openings a sprocket and an annular flange secured to said driven shaft and a thread pattern formed on said driven shaft, said sprocket, annular flange and thread pattern positioned in spaced relation to one another, a cam disc rotatably positioned on said driven shaft between said annular flange and said thread pattern, and a secondary body member engaged on said thread pattern, an annular ring within said first mentioned body member about said cam disc and spaced with respect thereto, a plurality of cam slots

formed in the periphery of said disc and a plurality of rollers located one in each of said cam slots for engagement with said annular ring when moved in one direction, means for rotating said secondary body member, said secondary body member being capable of limited rotation on said thread pattern on said driven shaft to engage said cam disc and move the same against said annular flange to move the driven shaft and sprocket in another direction.

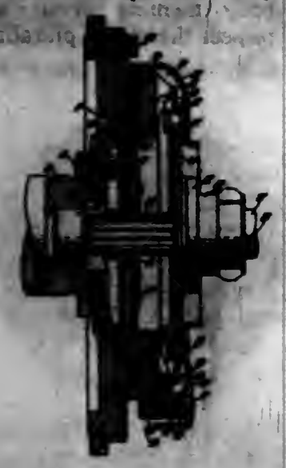
2,770,340



**AUTOMATIC VARIABLE SPEED FLUID TRANSMISSION**

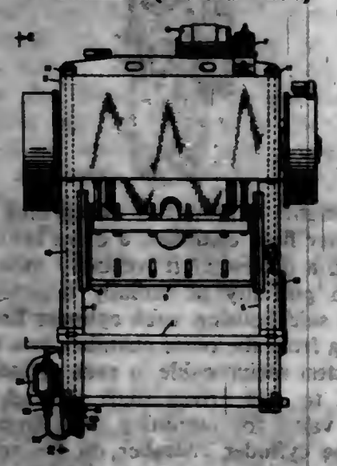
Edward C. Bynum, Ridgecrest, Calif.

Application January 26, 1955, Serial No. 484,323



9 Claims. (Cl. 192—60)

(Granted under Title 35, U. S. Code (1952), sec. 266)

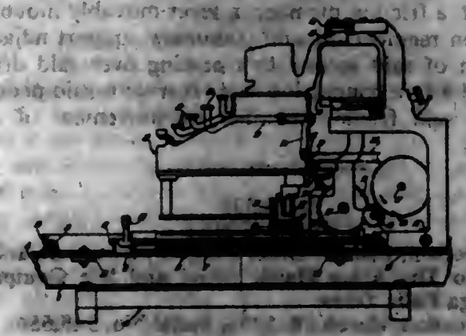


2. An automatic fluid clutch comprising a housing forming an outer fluid chamber, a drive shaft connected to the housing, a driven shaft rotatably mounted within the housing, a plurality of radially disposed cylinders secured within said housing, each cylinder having a fluid passage leading from the outer chamber into the cylinder chamber, a piston reciprocable in each cylinder chamber and connected to said driven shaft through a slippage connection, a valve for admitting fluid from the outer chamber to the cylinder chamber on the return stroke of the piston, a control member slidably mounted on each cylinder and movable by centrifugal force to restrict the fluid flow out of the respective cylinders in accordance with the rotational speed of the drive shaft, and resilient means for resisting the restricting movement of the control member.

2,770,341
CLUTCH ASSEMBLY
Marvin T. Wolverek, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 21, 1954, Serial No. 431,367
7 Claims. (Cl. 192—68)

1. A clutch assembly including a flywheel cover adapted to be secured to a flywheel member and having a diaphragm spring and pressure plate means secured thereto, said pressure plate including annularly arranged projections formed near the outer periphery of one face thereof and having radial projections formed on the outer periphery thereof, and laterally flexible drive straps secured to said radial projections and extended chordally across said pressure plate outwardly of said annular projection for securement to said flywheel cover, said pressure plate being adapted to be rotated with said flywheel through said cover and drive straps and being adapted to be axially movable by said diaphragm spring for engaging frictional clutch plate means adapted to be disposed between said flywheel and pressure plate for the transmitting of flywheel rotation to a rotatable shaft adapted to be connected to said clutch plate means.

2,770,342
OVERLOAD RELEASE ASSEMBLY FOR POWER PRESSES
Elmer K. Johansen, Oak Park, Ill., assignor, by mesne assignments, to U. S. Industries, Inc., a corporation of Delaware
Application February 1, 1954, Serial No. 407,191
10 Claims. (Cl. 192—150)

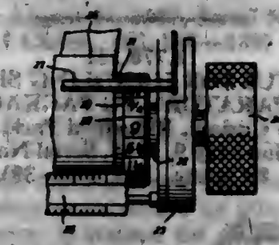


1. In a mechanical metal working press having a frame including a crown, a bed, uprights, tie rods connecting the crown with the bed, and a reciprocating slide, a hydraulic pressure control mechanism comprising, an overload device including a reciprocable member, hydraulic fluid pressure means normally urging said member in one direction, pneumatic pressure means normally urging said member in the opposite direction, said pressures being substantially equal during normal operation of the press, means operatively associated with the tie rods and connected with said hydraulic fluid pressure means to increase the hydraulic pressure when excessive pressure is exerted by the slide, thereby to move said member against the pneumatic pressure and relieve the overload condition, and means responsive to a predetermined reduction in hydraulic pressure, to reduce said pneumatic pressure and return said hydraulic pressure to normal.

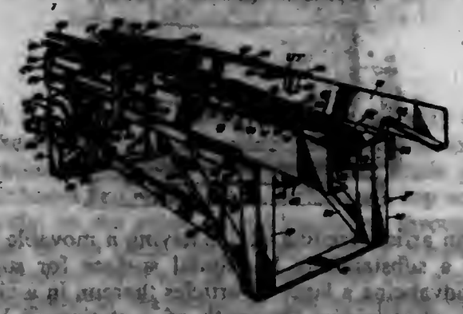
2,770,343
COIN TESTER
Boley A. Andrews, Kansas City, Kans., and Lorne A. Shontz, Jr., Kansas City, Mo., assignors to The Vendo Company, Kansas City, Mo., a corporation of Missouri
Application November 26, 1951, Serial No. 258,264
2 Claims. (Cl. 194—102)

1. In a coin selector, a coin-receiving chute having spaced walls and adapted to freely pass gravitating coins below a predetermined thickness, one of said walls extending downwardly below the other wall; an arm below said other wall and spaced from said one wall; means mounting said arm for swinging movement on a horizontal axis toward and away from said other wall; and structure normally disposed for engagement by thicker coins gravitating through the chute and including a beveled disc adjacent said means for engagement by one marginal edge of the thicker coins for decreasing the clearance between the arm and said one wall intermediate the ends of the arm, and a stop on one end of the arm for engagement by the peripheral edge of said thicker coins and movement thereby with the arm to deflect the larger coins as they fall below the lowermost end of said other wall.

2,770,344
LINE-SPACE CONTROL MECHANISM FOR FLAT PLATEN TYPEWRITER OR THE LIKE
Oscar J. Sundstrand and Oscar W. Swanson, West Hartford, Conn., assignors to Underwood Corporation, New York, N. Y., a corporation of Delaware
Application May 21, 1953, Serial No. 356,494
5 Claims. (Cl. 197—124)

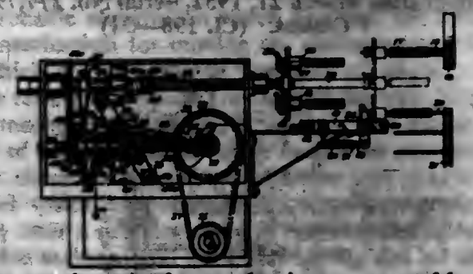


1. In a machine of the class described, a type carriage having a set of type actions and a keyboard by means of which said type actions may be selectively actuated, a flat platen horizontally mounted beneath said type carriage and against which said type actions are arranged to



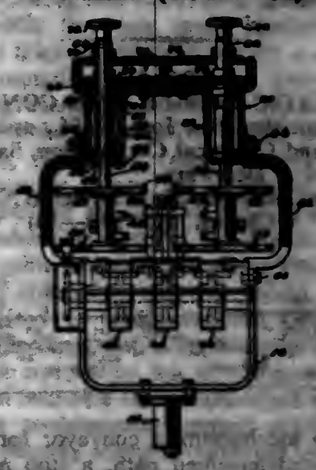
strike, mechanism for advancing said type carriage in letter feed direction in response to operation of the type actions, a motor, a carriage return key, means responsive to operation of said carriage return key to cause said motor to return said type carriage to line-start position, line-space mechanism for effecting a relative line-space movement between said type carriage and said platen, and means connecting said carriage return key to said line-space mechanism whereby operation of said line-space mechanism is instituted by operation of said key.

2,770,345
POSITION DETERMINING DEVICE
William Ray Brown, Corpus Christi, Tex.
Application April 25, 1955, Serial No. 503,607
12 Claims. (Cl. 197—189)



1. A device for determining the position of the line of typing of a typewriter or the like relative to an end of a sheet of paper inserted in the platen thereof, comprising a first member rotatable with the platen, a second member connectable to said first member for rotation relative thereto, indicia arranged substantially concentrically about the axis of rotation of one of said members and including numerals representative of the distance traveled by the platen during a whole number multiple of revolutions of said one member, and means on the other of said members providing a datum point for indicating the numeral to be read in determining said position of the line of typing, said numerals being arranged about the axis of rotation of said first member and including multiples of a unit of measurement which is an aliquant of the platen circumference and an aliquot of said whole number times the platen circumference, said first and second members being connectable by gears in which the ratio of said first member gear teeth to those of said second member corresponds to the ratio of the platen circumference to the largest multiple of said unit of measurement which is less than the platen circumference, and said datum point providing means comprising equally spaced apart indicating lines which correspond in number to said largest multiple of said unit of measurement which is less than the platen circumference divided by said unit of measurement.

2,770,346
PALLET FEEDER
George L. Oswalt, Elmwood Park, Ill.
Application June 24, 1952, Serial No. 295,311
9 Claims. (Cl. 198—19)

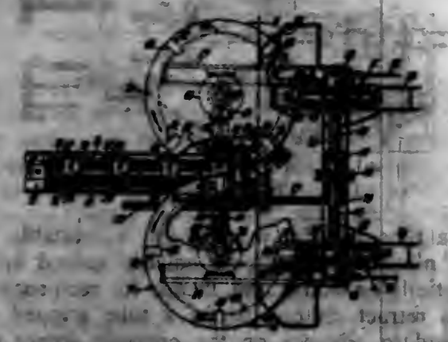


1. In a pallet feeding mechanism wherein pallets are fed to and from a molding mechanism with a molding station where blocks are molded on pallets as they are consecutively presented and removed from the molding station, the improvement including a pair of tracks, one along which pallets are fed to and the other along which pallets are fed from the molding station, a feeding carriage for each track, and power means for intermittently reciprocating both carriages at the same time including a continuously rotating mutilated driving gear, and a driven pinion intermittently rotating and in meshing engagement with said gear, the number of teeth on the pinion exceeding the number of teeth on the gear by one so that one revolution of the gear will cause one revolution of the pinion.

2,770,347
COLLAPSIBLE TUBE TRANSFER MECHANISM
Jack N. Portenfield, Chico, Calif.
Application October 14, 1952, Serial No. 314,729
16 Claims. (Cl. 198—28)

1. In a tube transfer mechanism, a rotatable gripper frame, a plurality of grippers equally spaced apart circumferentially on said frame, means for reciprocating the frame, to retract on one stroke a tube gripped by one gripper and to advance on the opposite stroke another tube gripped by another gripper, means for intermittently rotating the frame in the same direction for part of a revolution during the last part of a tube-retracting stroke and during the initial part of a tube-advancing stroke of the reciprocating means, said frame-rotating means including a clutch, and means for engaging and disengaging the clutch, means to guide and to align the frame and to hold the frame against rotation during the initial part of the retracting stroke and during the last part of a tube-advancing stroke, and means in the path of the frame to operate a gripper to release the tube gripped thereby at the end of a selected tube-advancing stroke.

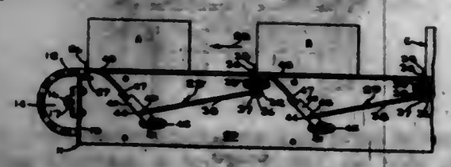
2,770,348
CONTAINER ACTUATED DIVIDER
Carl L. Day and Frederick E. Pfaff, Baltimore, Md., assignors to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York
Application March 18, 1953, Serial No. 343,128
9 Claims. (Cl. 198—31)



1. A conveyor mechanism for directing articles travelling on a conveyor comprising a supporting frame, a

plurality of vertical tubular sleeves rotatably mounted in said frame, a gear train interconnecting said sleeves for synchronizing relative movement of the same, shafts mounted in each of said sleeves, article directing means detachably connected on the lower ends of each of said shafts, and means on the upper ends of said shafts and said sleeves coacting to drivingly connect and support said shafts in said sleeves, said last-mentioned means being detachable to permit upward vertical movement of said shafts with respect to said sleeves whereby the article directing means may be removed from said shafts and replaced.

---



2,770,349
CONVEYOR MECHANISM FOR DIVIDING SINGLE LINE OF ARTICLES INTO DOUBLE LINE
Ronald E. L. Nordquist, Maplewood, N. J., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application March 21, 1952, Serial No. 277,796
7 Claims. (Cl. 198—31)

1. In a conveying mechanism for magnetizable can bodies and other articles, the combination of a conveyor for advancing can bodies along a predetermined path of travel in spaced and timed order, a pair of oppositely disposed divider wheels located one on each side of said conveyor in the path of travel of said can bodies and between which said bodies pass, said divider wheels carrying peripherally located magnets arranged in alternately spaced relation, means for rotating said divider wheels in unison and in time with said conveyor for rotating said magnets individually into engagement with can bodies advanced into position between said wheels for removing said can bodies alternately from said conveyor in spaced and timed order for distribution of said can bodies in said spaced and timed order into two separate paths of travel, a rotatable star wheel located adjacent each of said divider wheels and having prongs engageable with the can bodies on said wheels for further advancing said bodies in said spaced and timed order, and means for rotating said star wheels in time with said divider wheels.

---

2,770,350
AUTOMATIC SELF-FILLING CONVEYOR
Hans G. Hoffmeister, San Jose, Calif., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application December 26, 1952, Serial No. 327,990
6 Claims. (Cl. 198—34)

1. In a stop mechanism, a conveyor for moving articles along a predetermined path, a stop member pivotally mounted adjacent said conveyor and having an abutment surface movable into and out of a position obstructing the movement of an article along said path, said stop member being arranged for pivotal movement in the direction of article movement on said conveyor out of article obstructing position in response to abutment thereagainst of an article being moved on said conveyor, a control member having a separate pivotal mounting adjacent said conveyor and spaced longitudinally thereof from said stop member, said control member having an abutment portion movable into and away from a position obstructing the movement of an article along said path, and means interconnecting said stop member and said control member for conjoint movement, said interconnecting means being so arranged that movement of either said stop member or said control member out of the path of an article advanced on said conveyor moves the other member into path obstructing position.

---

2,770,351
APPARATUS FOR HANDLING SPAGHETTI PREPARATORY TO PACKAGING
Aldo Cariani, Ridgefield Park, N. J.
Application May 9, 1955, Serial No. 506,701
8 Claims. (Cl. 198—39)

1. A device for handling spaghetti or the like, said device comprising a flexible endless carrier mounted for movement about a path having upper and lower stretches, drive means for effecting movement of said carrier in increments about said path, a plurality of receptacles secured at spaced points along said carrier for movement therewith and each adapted to receive a quantity of spaghetti when in one position on said upper stretch, means responsive to the delivery of spaghetti to each of said receptacles for actuating said drive means to move a successive receptacle into said one upper stretch position, at least one upwardly opening hopper disposed below said lower stretch for receiving successive quantities of spaghetti from said receptacles when the latter are moved to said lower stretch, and a member slidable in said hopper for feeding each of said quantities of spaghetti from said hopper to a packaging machine.

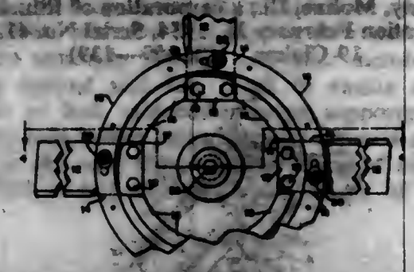
---

2,770,352
DEVICE FOR ORIENTING AND FEEDING ARTICLES
Kasper F. Moller, Chicago, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application October 29, 1951, Serial No. 253,659
8 Claims. (Cl. 198—34)

1. In an article feeding device having a movable member with a substantially horizontal surface for supporting and advancing a layer of articles thereon in a circular path, the combination therewith of a stationary hopper for holding a supply of said articles, said hopper having an outlet for said articles positioned a distance slightly

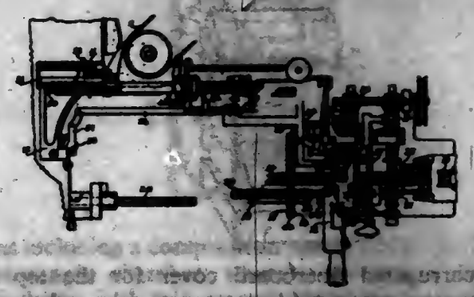
greater than the dimension of the article above the article supporting surface of said movable member to permit a single layer of said articles to be advanced therebeneath by said member, and a door pivotally supported on said hopper and movable to an upper position to close said outlet and a lower position to open said outlet for the passage of a single layer of said articles from said hopper onto said member, said door being moved to its upper position by the articles advanced thereunder.

---



2,770,353
TAKEUP DEVICE FOR ARTICULATED CONVEYORS AND CUSHIONING MEANS THEREFOR
Frederick B. Miller, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application August 26, 1953, Serial No. 376,666
1 Claim. (Cl. 198—189)

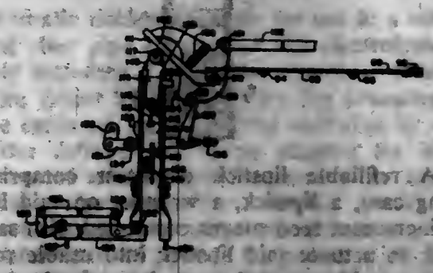
In an articulated flight conveyor for a mining machine, said conveyor being characterized by idler members over which the conveyor is trained for reversal in direction thereof, means for taking up the slack occasioned by changes in effective length of a conveying reach of said conveyor during articulation thereof and for absorbing the shocks incident to reversal of direction of such conveyor over said idler members, said takeup means comprising a movable idler shoe over which said conveyor is reversed in direction, a flexible strand connected to said movable idler shoe, a fixed sheave around which said strand is wrapped and fastened, a second sheave of smaller diameter having a second flexible strand wrapped thereabout and fastened thereto, and a weight connected to said second strand and having guide means therefor, resilient means disposed within said weight and having one end bottomed against said weight and its other end bottomed against means confining said resilient means and secured to said second strand for cushioning the tugging upon said strands occasioned by the shocks induced by passage of said flights around said idler members and said movable idler shoe.



---

2,770,354
DISTRIBUTOR FOR AN COMPOSITOR
Willard L. Morrison, Lake Forest, Ill., assignor to Chicago Stock Yards Compost Company, Chicago, Ill., a corporation of Illinois
Application February 27, 1954, Serial No. 411,599
12 Claims. (Cl. 198—139)

1. A fan including a hub, having a plurality of radial slots therein, inclined to a plane perpendicular to the axis of rotation of the hub, a removable fan blade perforate at its inboard end, socketed in each slot, a cap screw perpendicular to the plane of and extending through a perforation in the blade adapted to exert a pressure tending to displace such end in one direction and a cap screw perpendicular to the plane of and extending through a perforation in the blade tending to displace such end in the opposite direction.



2,770,355
SAFETY CONTROL MECHANISM FOR A TYPE COMPOSING AND LINE CASTING MACHINE
Byrd S. Fine, Chicago, Mass.; Margaret A. Fine, administratrix of said Byrd S. Fine, deceased
Application January 7, 1953, Serial No. 330,069
7 Claims. (Cl. 199—18)

1. A type composing and casting machine comprising a reciprocable elevator on which matrices are assembled, power mechanism for moving the elevator, notched code bars which are movable to positions of aligning sets of notches selectively, means for moving the code bars selectively, mechanism including a selector bar movable into one set of aligned notches which causes the power mechanism to move the elevator, mechanism including a releasable lock which normally permits movement of the elevator only after a substantially full line of matrices has been assembled thereon, said code bars having one set of aligned quadding notches for governing a quadding operation, and mechanism including a special selector bar movable into the aligned quadding notches which causes the lock to be released although the matrix line is incomplete so that the elevator may move for a quadding operation.

---

2,770,356
CONTROL UNIT FOR COMPOSING MACHINES
Arthur F. Lindberg, Chicago, Ill., assignor, by mesne assignments, to Teletypesetter Corporation, Chicago, Ill., a corporation of Delaware
Application December 1, 1953, Serial No. 395,509
4 Claims. (Cl. 199—18)

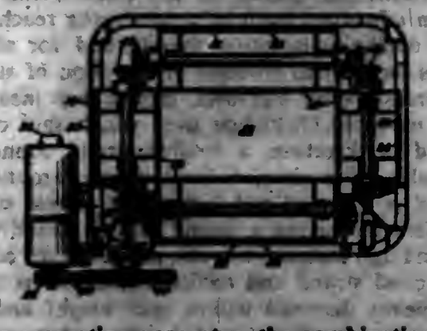
1. In a linecasting and composing machine, means for releasing variable thickness space elements, means for releasing fixed thickness space elements, a record reading means, a permutation code selector controlled by said record reading means, a selectable member controlled by a predetermined permissive setting of said selector for controlling both said releasing means, a pair of alternately operable means for operating said releasing means, said pair of means parallelly disposed with respect to said selectable member, an actuating means comprising a swingable member operably relatable alternately to said pair of alternately operable means, said actuating means articulated to said selectable member, floating means for controlling said swingable member, and latchable means for controlling the effectiveness of said floating means, said latchable means controlled by said selector in response to predetermined record reading conditions, whereby said floating means is rendered effective to control said swingable member to control the sequential operation of said pair of alternately operable means.

2,770,357
CARTON
William C. Sheard, Cleveland, Ohio, assignor to General Container Corporation, Cleveland, Ohio, a corporation of Ohio
Application November 15, 1954, Serial No. 468,887
9 Claims. (Cl. 206—7)

3. A corrugated fiberboard cover for the top of a clothes storage carton, said cover comprising substantially identical sections each having a plane rectangular top wall and side walls depending from three edges of the top wall and at right angles thereto, an integral transversely extending intermediate portion between said sections connecting the fourth edges of the top walls together, said portion being channel-shaped in cross section and extending below the planes of the top walls of said sections and having a length shorter than the length of each section, a rigid bar in the channel of said portion, said bar being longer than said portion and shorter than each section, the ends of the bar projecting slightly beyond the ends of said portion, and a plurality of clothes supporting holes in said bar and said intermediate portion.

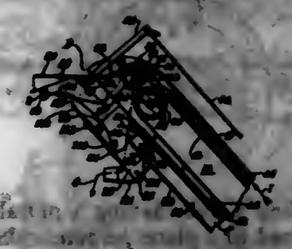
2,770,358
REFILLABLE LIPSTICK DISPENSER
Henry I. Keith, Chicago, Ill., assignor to Frank H. Keith, Chicago, Ill.
Application October 19, 1951, Serial No. 252,165
4 Claims. (Cl. 206—56)

1. A refillable lipstick dispenser comprising a dispensing case, a lipstick, a wrapper on said lipstick, and fixed increment feed means connected with said wrapped lipstick to actuate said lipstick into usable relation with respect to said case and in predetermined advanced positions with respect to said case, said wrapper having perforations therein to form tear lines whereby portions of said wrapper may be successively torn away to expose unused portions of said lipstick, said wrapper also comprising means to maintain said lipstick out of contact with the working parts of the dispenser, and said tear lines being spaced to conform with the increments of advance of said fixed increment feed means.



2,770,359
PALLETS AND CONTAINERS FOR TRANSPORTING BRICK AND THE LIKE
William E. White, Bethlehem, Pa., and John R. Clark, Silver Spring, Md., assignors, by direct and mesne assignments, to said John R. Clark and Thomas Somerville III, Kenwood, Md., as trustee
Application May 27, 1952, Serial No. 290,266
7 Claims. (Cl. 206—65)

6. A package, comprising a pallet member, a pile of bricks on said pallet member, an enclosure surrounding said pile of bricks comprising a plurality of side members separate from said pallet member, means projecting angularly from the side members to rest on the pile and

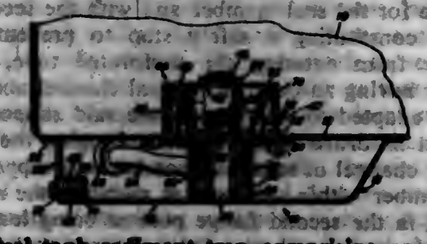


hooks on one vertical edge of each side member engaging detents on the vertical edge of the adjacent side member.

2,770,360
SEPARATOR
Rolf Moen, Minneapolis, Minn., assignor to General Mills, Inc., a corporation of Delaware
Application June 8, 1953, Serial No. 360,127
9 Claims. (Cl. 209—139)

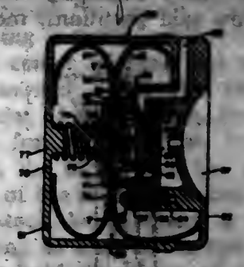
1. In a separating apparatus, the combination of movable wall means arranged to constitute the sides of a vertical passageway having a substantially continuous inner wall surface, means guiding said wall means in a direction so as to maintain said passageway open at all times, means for causing fluid to flow upwardly through said passageway at a selected rate, and means for moving said wall means in the direction of fluid flow at a rate corresponding substantially to said selected flow rate.

2,770,361
COTTON BOLL SEPARATOR
Jack F. Foster, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application February 26, 1954, Serial No. 412,773
19 Claims. (Cl. 209—139)



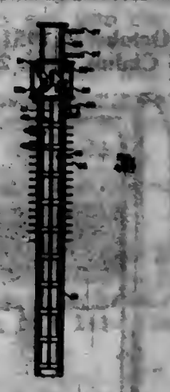
1. In a material-separating apparatus having an uphill conveyor housing from the upper end of which indiscriminately commingled heavier and lighter material is discharged in a downward stream and an air blast issuing from an air discharge outlet below the conveyor traverses the stream with such intensity to permit the heavier material to continue downwardly while causing the lighter material to depart from the stream and move

generally in the direction of the blast and wherein a deflector mounted adjacent to the conveyor housing above and beyond the air discharge outlet above the air blast is positioned to intercept the blast containing the lighter material for redirecting the lighter material, the improvement residing in a secondary separating unit comprising: a laterally disposed plate member also inclined uphill and having upper and lower ends, a pair of side members depending from the housing and fixed to the plate member to form with the latter an elongated channel positioned under the air blast, with the lower end of the plate member traversing the material stream, and the upper end of the plate proximate to the deflector and defining therewith a discharge opening through which the lighter materials are blown by the air blast, said plate member serving to deflect toward the lower end of the plate member not only heavier material dropping through the air blast from the discharge stream but incidental lighter materials carried by the heavier materials, a part adjustably mounted on the upper end of the member for movement toward and away from the deflector to vary the size of the discharge opening, means directing an additional blast of air at the plate member so as to drive the remaining incidental lighter material up the plate member and through the discharge opening while the heavier material gravitates to the lower end of the plate member, an adjustable discharge device positioned beneath the lower end of the member for redirecting and distributing the heavier material gravitating from the plate member, and means connecting the adjustable discharge device to the secondary separating unit.



2,770,362
FUEL TANK SEDIMENT TRAP
Patrick J. Pagnia, West Brookfield, Mass.
Application June 25, 1954, Serial No. 439,266
2 Claims. (Cl. 210—43)

1. A fuel tank sediment trap comprising an auxiliary tank securable to the bottom of a fuel tank, a fuel block seated on the bottom of said auxiliary tank and adapted to project up into a fuel tank, said fuel block including an upper fuel inlet, a filter member carried by an upper portion of said fuel block, a shield around said filter member preventing direct downward flow of fuel into said fuel inlet, whereby fuel passing into said fuel inlet first passes upwardly through said filter member, baffles extending around said fuel block to ensure direct upward flow of fuel, said baffles being supported by said fuel block, said baffles being spirally disposed and of increasing height, said filter member being of an inverted conical outline and abutting upper edges of said baffles.



2,770,363
LIQUID DELIVERING DEVICE
John L. Ryde, Los Angeles, Calif., assignor to McCulloch Motors Corporation, Los Angeles, Calif., a corporation of Wisconsin
Application June 15, 1953, Serial No. 361,458
11 Claims. (Cl. 210—46)

1. In a liquid delivering device: a liquid supply chamber; wall members enclosing a second chamber, said members including a fixed wall member having an annular rib and an impervious movable wall member; absorbent means communicating with said two chambers; said means including a portion disposed between said annular rib and said movable wall member; means for urging said movable wall member toward said annular rib, said

means including a compression spring disposed within said liquid supply chamber, whereby air is prevented from being drawn into said second chamber from said liquid supply chamber, and an outlet from said second chamber adjacent the base of said fixed wall member.

2,770,364
ALKALI METAL PURIFICATION DEVICE
John S. Hoose, Baton Rouge, La., assignor to Ethyl Corporation, New York, N. Y., a corporation of Delaware
Application October 14, 1954, Serial No. 462,235
2 Claims. (Cl. 210—67.5)

1. An automatic tickler assembly for use in a substantially vertical riser pipe of a fused salt electrolysis cell, said assembly including a tickler for insertion within the riser pipe, the tickler having elements for sweeping substantially the entire riser pipe internal wall area by movement hereafter defined, and being adapted for limited vertical movement and for rotation, means for applying solely vertical reciprocating force to the tickler independent of rotation thereof, said force including a downward thrust of at least 10 pounds for pound of the tickler weight, and guiding means, said guiding means including a stationary, two element, cylindrical cam and a follower operatively attached to the tickler, the cam defining a repetitive series of cycles for the tickler, each cycle consisting of vertical upward and downward movements of equal amplitude of from about two to about six inches and unidirectional rotation in a portion of each vertical movement, the ratio of rotation to the concurrent vertical movement being not greater than about 30 degrees per inch.

2,770,365
VACUUM FLOTATION AND LIQUID PURIFICATION APPARATUS AND PROCESS
Otis D. Welsch, Tonopah, Nev.
Application October 1, 1952, Serial No. 312,461
3 Claims. (Cl. 210—53)

1. An apparatus for scum flotation of materials comprising a vessel having two opposed and upwardly extending partitions therein forming upper and lower separating chambers in said vessel, said partitions being spaced and

terminating in vertical lips at their inner sides, thereby forming a passageway between said upper and lower chambers, said lower chamber having opposed parallel plates disposed therein forming an air-lift compartment, a baffle with downwardly extending walls over said compartment and below said partitions, means to admit air

under atmospheric pressure to said compartment, means for reducing pressure below atmosphere in said upper chamber, means on one side of said lower chamber to admit said materials, gravity exit means in said upper chamber for said materials, and exit means for the residue of said materials on the other side of said lower chamber.

2,770,366

**REVERSE FLOW CLEANABLE AQUARIUM FILTER**

Stanley J. Pszenwoski, Erie, Pa.; now by change of name to Stanley J. Prusz, assignor to Gustavo Miller, Washington, D. C.

Application October 2, 1951, Serial No. 249,370

3 Claims. (Cl. 210—98)

1. A reverse flow cleanable aquarium filter comprising a filtering medium container arranged to be suspended in an aquarium, said container comprising an open top member, a foraminated false bottom for supporting the filtering medium spaced from the bottom of said container, the container bottom having a port extending therethrough, means for removably suspending said container in the aquarium including an aquarium wall engaging hanger secured to one side of said container, a pipe secured vertically along one side of said container from below the bottom thereof and extending to discharge over the open top of said container an angle pipe rotatably mounted on the lower end of said vertical pipe, an air conduit connected to said vertical pipe adjacent its lower end and secured thereto, the other end of said air conduit being arranged to be connected to an aquarium aeration source to discharge into said vertical pipe and to cause aquarium water to flow from said pipe bottom end upwardly therethrough into the open top of said container, through the filtering medium therein, through said foraminated false bottom and said bottom port to the aquarium, said filtering medium container being readily removable from the aquarium, with said air conduit disconnected, said bottom port being arranged to be connected to a cleansing water supply to provide a reverse flow of cleansing water therethrough, through the foraminated false bottom, through the filtering medium supported thereon and out the open top to waste to thereby cleanse the filtering medium in position within the container.

2,770,367

**OIL FILTER SEAL CONSTRUCTION**

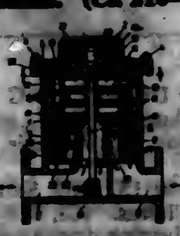
John A. Donnelly, Brookville, Ohio, assignor, by mesne assignments, to Eaton Motor Systems, Inc., a corporation of Pennsylvania

Application May 5, 1953, Serial No. 353,152

1 Claim. (Cl. 210—149)

In a perforated cylindrical type oil filter cartridge containing filtering material, an outer cartridge filter wall, a central perforated tube within the outer cartridge filter wall and having an open end portion to fit around a supporting bolt, the combination of seal means for providing a seal between the supporting bolt and the end portion of the central perforated tube, said seal means comprising an anchor member and a seal member mounted within the anchor member, said anchor member comprising an annular ring having first and second spaced in-turned flange portions defining substantially a U-shaped cross section, said flange portions respectively having an opening to surround said supporting bolt, said anchor member being mounted at the open end portion of the tube with the first flange portion constituting an entrance for the seal member and with the second flange portion constituting a safety stop to prevent the seal member from entering the perforated tube, said seal member having an outer peripheral channel and an inner surface adapted to snugly embrace said supporting bolt, said first in-turned flange portion engaging the outer peripheral channel of said seal member and supporting said seal member within said anchor member, the size of the opening in the second flange portion being less than the size of the seal member and the distance that the second flange portion is spaced from the first flange portion being less than the thickness of the seal member whereby the second flange portion prevents the seal member from entering the perforated tube, said anchor member and said seal member supporting said filter cartridge against lateral movement but permitting axial movement of the filter cartridge with respect to said supporting bolt.

---



2,770,368

**LIQUID FILTERS**

Ernst Max Tischer, Augsburg, Germany

Application December 29, 1952, Serial No. 328,227

12 Claims. (Cl. 210—164)

1. A filter for liquids comprising a housing, an inlet passage leading into the housing axially thereof, a closure for the other end of said housing, a drum-shaped filter element comprising an axial cylinder forming a passage arranged as an extension of the inlet passage, a cylindrical filter means spaced radially outwardly by an imperforate annulus from said axial passage, an outlet coaxial of said inlet intermediate said axial passage and said cylindrical filter means, a plurality of flat filter elements each comprising an outer ring of the same diameter as the cylindrical filter element, and an inner ring, said outer ring being of greater axial length than said inner ring, said rings being interconnected by hollow spokes constituting passages for the liquid, filter material closing the ends of said inner rings, a bolt extending axially from said inlet passage through all of said filter elements to secure said elements in the housing and against said inlet, and a cover for the endmost flat filter element contacting the outer ring thereof.

---

2,770,369

**LIQUID PURIFYING FILTERS**

Cornelis Wichert Hulsbergen, The Hague, Netherlands

Application April 14, 1953, Serial No. 348,644

3 Claims. (Cl. 210—171)

1. A nozzle for use in liquid purifying filters comprising two identical nozzle sections each having an annular base, a circular series of outwardly tapering elements integral with and axially projecting from said base and uniformly spaced to an extent somewhat exceeding the width of such elements, said nozzle sections being coaxially assembled so that the elements of one section interengage with some lateral clearance with those of the other section, and means for locking said sections in said relative position comprising at least one local enlargement on each said element so disposed that, in coaxially assembling said nozzle sections, the tips of the elements of one section are jammed between the roots of the elements of the other section to thereby define the width of the outlet slots formed by the lateral clearance of the inter-engaging elements.

2,770,370

**STACK TYPE FILTER WITH CHANNELED CENTER STANDARD**

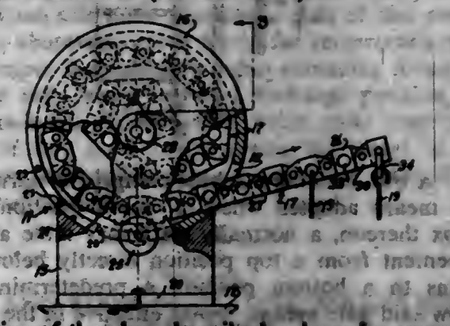
Edgar J. Griffin, Pittsburgh, Pa.

Application March 7, 1952, Serial No. 275,431

2 Claims. (Cl. 210—183)

1. A stack type liquid filter comprising a housing with an outlet, a stack of annular filter plates having a center opening therethrough and located within the housing, the plates of said stack having surfaces around their outer and inner edges for stamping filter elements between the plates, and said plates enclosing chambers between them and having openings for the passage of liquid into and out of the chambers for passage through the filter elements that are clamped between the successive plates, a standard extending through the outlet of the housing and extending through the center opening of the stack, the standard having a width substantially equal to the diameter of said center opening and aligning the filter plates with one another, a threaded element located inwardly of the outlet of the housing, threads on one end of the standard for screwing the standard into said threaded element, the threads on the standard stopping short of the part of the standard within the center opening through the stack, an abutment at the other end of the standard having an annular bottom face for contact with the stack to hold the plates of the stack together under pressure with the filter elements between them and the standard serving as a tension member, said standard having channels in its circumferential surface extending lengthwise of the standard for a substantial distance from the abutment face and along the portion of the standard that is surrounded by the stack of filter plates, the channels terminating short of the threaded end of the standard, and said standard having its threaded end of a width at least as small as the center opening through the stack of plates and tubular for a distance beyond the threads and within a portion of the length of the standard having the channels therein, the tubular part of the standard being unobstructed and of circular cross section and opening at its upper end into the channels beyond the threads of the standard and providing a passage for flow of liquid from the channels into the tubular part of the standard and through the outlet of the housing, and means sealing the liquid from flow in contact with the threaded portion of the standard.

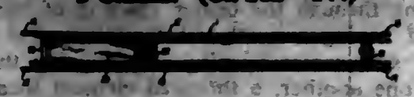
---



2,770,371

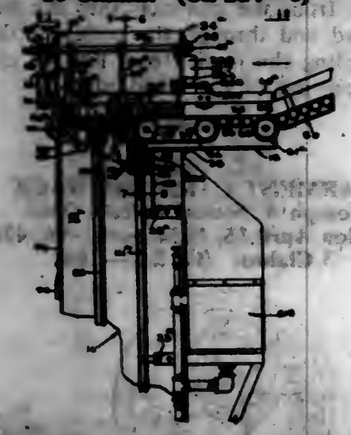
**GARMENT CARRYING RACK**

Joseph A. Sodon, Toledo, Ohio



Application April 15, 1954, Serial No. 423,332

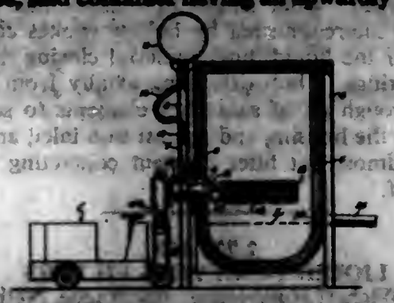
3 Claims. (Cl. 211—104)



1. In a device of the class described, a base for mounting on a support and having a recess in its top, a housing of narrow cylindrical form for edgewise mounting in said base recess, said housing having a series of circumferentially spaced sockets around its edge and a peripheral opening on that portion of the housing adjacent the spaced sockets, means carried by the base and releasably engageable with the sockets in the housing to retain the housing seated in said recess and thereby adjust the housing about its axis and the angle of the peripheral opening with respect to the base, a rack member for coiling in said housing about a central point therein and having its inner end anchored in the housing and its outer end portion extendible outwardly through said opening by an uncoiling within the housing, said member being composed of a plurality of pivotally connected links which have relative inward pivotal movements relative to the housing center from a substantially straight line position and have coacting shouldering parts that prevent flexing of the member outwardly in a vertical plane from said straight line position.

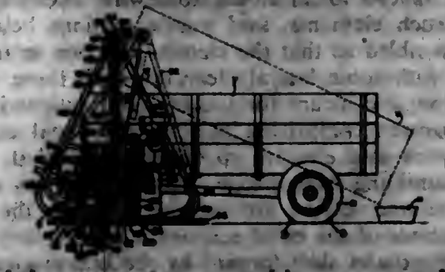
2,770,372
BOOM
Edwin O. Mantheaux, Milwaukee, Wis., assignor to Kearney Company, Milwaukee, Wis., a corporation
Application April 29, 1952, Serial No. 285,891
3 Claims. (Cl. 212—146)

3. A composite boom of the class described, comprising a pair of substantially identical girder members having web portions, a pair of tubular cross members spaced along the girder members, the respective ends of the cross members being entered in openings in the web of each girder and being welded thereto around the openings, disc like parts welded within the tubular members in alignment with the webs of the girder members, and a diaphragm extending between the tubular members and the webs of the girder members, said diaphragm being continuously welded to the said webs and tangentially continuously welded to the said two tubular members.



2,770,373
MACHINE FOR STACKING BOXES, CASES, AND THE LIKE
Ernest A. Vervinkle, Riverside, and Earle J. McGrath, Nueve, Calif., assignors to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application December 29, 1952, Serial No. 328,445
18 Claims. (Cl. 214—6)

1. A box stacking machine comprising normally closed gate means adapted when in closed position to support a box thereon, a normally stationary table arranged for movement from a top position directly below said gate means to a bottom position a predetermined distance below said gate means, means effective in the presence of a box on said gate means to open said gate means so as to drop the box onto said table and to lower said table until the box has dropped below the level of said gate means, and stack limiting means adjustable to protrude into the path of a box on said table at selected levels between said top and bottom positions and effective upon engagement with the lowermost box on said table to hold said gate means in closed position.



2,770,374
APPARATUS FOR REFINING LEAD SCRAP
Cecil E. Bennett and Charles B. Bradfield, Baton Rouge, La., assignors to Schuylkill Products Company, Inc., Baton Rouge, La., a corporation of Louisiana
Original application April 6, 1951, Serial No. 219,628. Divided and this application April 23, 1953, Serial No. 350,282
2 Claims. (Cl. 214—18)

1. In combination, a lead scrap refining furnace and equipment for charging the furnace with scrap lead material, including an upright furnace wall having a charging opening with a door located externally of the furnace and mounted for upward movement, said door being provided with a roller extended along and below the lower edge of the door; a charging container, mounting means providing for movement of the container horizontally into the furnace through said charging opening, and mounting means providing for movement of the container in a vertical sense, said container having an upwardly presented

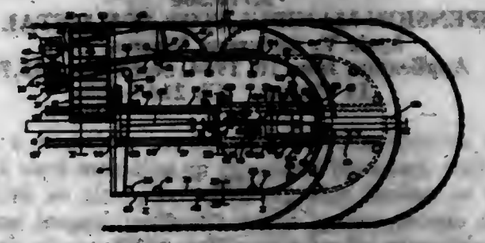
surface adapted to engage the roller at the under side thereof for opening the door when the container is moved upwardly, said surface also extending horizontally along the container to provide for rolling of the roller along the container as the container is introduced into the furnace, said container being dimensioned so that when the container is positioned beneath the door in engagement with the roller and moved vertically it will effectively block off the major portion of the charging opening at all times during the charging operation.

2,770,375
HOISTING APPARATUS FOR ELEVATING AND DUMPING VEHICLES
Leonard B. Neighbour, Moline, Ill., and Orville P. Lance, Davenport, Iowa, assignors to Deere & Company, Moline, Ill., a corporation of Illinois
Application May 28, 1949, Serial No. 95,906
13 Claims. (Cl. 214—46.34)

1. Hoisting apparatus, comprising: a generally elongated, horizontal platform having opposite end portions and adapted normally to rest on the ground or a comparable surface; a pair of end elements spaced apart and disposed respectively at the end portions of the platform, each element including an upright column and a base member rigid with the column and extending transverse to the length of the platform, each base member having a curved under surface symmetrical at each side of the base member and providing a rocker for rocking of the element selectively and symmetrically in opposite directions in a generally vertical plane transversely of the platform; and a pair of guide means respectively interconnecting each column with the proximate end portion of the platform to connect the platform to the elements for vertical movement relative to the elements and for movement with the elements as the latter rock as aforesaid.

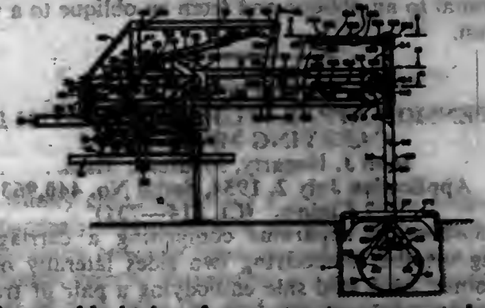
2,770,376
MOTOR VEHICLE BODY OF THE SELF-UNLOADING TYPE
Donald V. Zinn, Fort Wayne, Ind.
Application November 6, 1948, Serial No. 59,388
2 Claims. (Cl. 214—83.26)

1. In a semi-trailer for hauling bulk materials, a chassis having at the forward end a fifth wheel for coupling to a tractor and being supported at the rearward end by a set of road wheels, said chassis supporting a body generally of a W-shape in cross-section and having intermediate bulkheads dividing it into a plurality of compartments, each compartment including discharge openings controlled by adjustable gates which are operated by pneumatic pistons, said openings emptying into separate tunnels running longitudinally along the under side of and attached to the body, said tunnels forming troughs conforming closely to the peripheries of a pair of screw con-



veyors disposed horizontally beside and parallel to the longitudinal centerline of the body, said conveyors operating in conjunction with the forementioned gates, providing means of emptying the forementioned compartments selectively without regard to their respective positions in the body, said conveyor system being driven by a motor mounted on the forward end of the forementioned chassis, said conveyor system, by reason of its location outside the body, being easily accessible for maintenance and servicing of bearings and shafts through openings in the forementioned tunnels.

2,770,377
SUSPENSION FOR VEHICLES SUCH AS SHUTTLE CARS
Robert A. McCallum, Clarendon Hills, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application March 26, 1954, Serial No. 418,806
3 Claims. (Cl. 214—83.36)

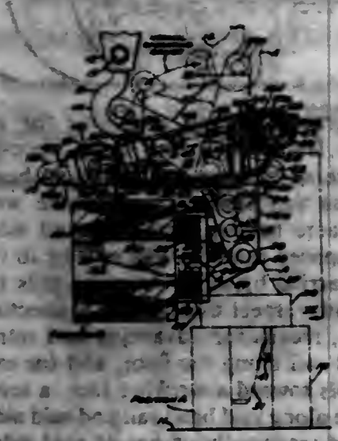


1. In a mine shuttle car, a frame, a material receiving compartment and an elevatable discharge compartment supported on said frame, a floor plate for each of said compartments, said floor plates lying substantially in the same plane and having an endless flight conveyor movable longitudinally thereof, means for suspending said frame so as to maintain said floor plates in such substantial plane comprising an axle disposed beneath said material receiving compartment and an axle disposed beneath said discharge compartment, each of said axles being spaced from the bottom of said vehicle frame and being arranged to have tilting movement with respect to said vehicle frame upon traverse of said car over irregular terrain, such tilting movement being restricted so as to prevent striking of said vehicle frame, means for enabling such tilting movement comprising members extending laterally of said frame and on each side of said axle, said members being rigidly secured to said vehicle frame, and means affording a connection between the ends of said members and a corresponding end of said axle comprising a stirrup connected to said axle near the end thereof with extensions therefrom substantially in alignment with said laterally extending members, and connecting members pivotally connected to said extensions and to said laterally extending members, said connecting members being angularly disposed to said frame and having their point of connection to said extension higher than the point of connection to said laterally extending member when said vehicle frame is in a normal position; said axle, said laterally extending members and the length of said connecting members being so arranged that the angularity of said connecting members is disturbed but little on one side of the vehicle when one of the wheels is encountering an irregularity in terrain, the angularity of the opposite connecting members changing so as to accommodate the shifting of the axle in accordance with such irregularity in terrain.

2,770,378
SCRAPER LOADER APPARATUS FOR MINES
Timothy F. McCarthy, Indiana, Pa., assignor of one-fourth to Goodman Manufacturing Company, Chicago, Ill.
Application December 21, 1953, Serial No. 399,539
7 Claims. (Cl. 214—93)

1. In a scraper loading apparatus for coal and the like, a guide frame extending along opposite ribs of a working place of a mine and having a head frame extending across the working face of the working place, said guide frame having parallel spaced side guide rails mounted in spaced relation with respect to the floor, and a head rail carried by said side guide rails for extensible movement with respect thereto and connecting said guide rails together, means for advancing and retractibly moving said head rail along the floor, and for extending said side guide rails toward a working face, a scraper reciprocally movable along said head rail and said side guide rails, a hoist spaced rearwardly of one of said side guide rails, a motor for operating said hoist, flexible draft devices connected from said hoist to opposite ends of said scraper and trained about said guide frame for reciprocally moving said scraper therealong, a ramp extending along one of said side rails into a material discharge position, and reversing switches on said side guide rails controlling operation of said hoist for reversing the travel of said scraper along said guide frame at opposite ends of the path of travel thereof.

2,770,379
BOOM AND BOOM-OPERATING MEANS FOR DIPPER STICK
Daniel F. Przybylski, Winona, Minn.
Application October 23, 1951, Serial No. 253,183
12 Claims. (Cl. 214—147)

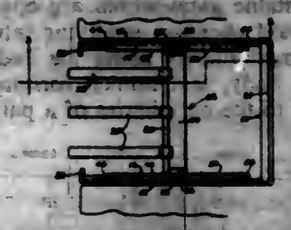


1. A portable bed, a frame structure mounted on the bed and having upper and lower track rails, a dipper having an upstanding dipper stick, a dolly having front and rear upper and lower wheels arranged to run on the track rails, an upper bearing and an intermediate mount in which the dipper stick is mounted to turn about its longi-

tudinal axis, a rocker bearing pivoted to the mount to turn about a horizontal axis, two substantially parallel booms pivoted at their inner ends to the dolly and pivoted at their outer ends to the rocker bearing, an inner link and an outer link pivoted to the booms at their intermediate portions and connecting the same, said outer link extending above the uppermost of said booms, a third boom overlying the first-noted booms, and pivoted at its inner end to the frame structure, a pivoted link connecting the third boom at its outer end portion to the uppermost of the first noted booms, means for operating the third boom, and a connection between the bearing on the dipper stick and the upper end portion of the outer link for moving the dipper stick about the axis of the rocker bearing.

---

2,770,380
SUSPENSION MANIPULATOR FOR METAL COILS
Lyle V. Anderson, Warren, Ohio
Application June 10, 1954, Serial No. 435,700
11 Claims. (Cl. 214—650)



1. A suspension manipulator for picking up and delivering a metal work piece such as a metal coil comprising, a support structure, a position change structure operatively mounted on and carrying said support structure, said position change structure having means to pivotally suspend its upper end portion, a pick-up means for the metal work piece operatively connected to a lower end portion of said position change structure, means for holding a work piece on said pick-up means, actuating means mounted on said support structure and operatively connected to said position change structure to move said pick-up means between vertical, oblique and horizontal positions, an actuating mechanism for said holding means operatively connected thereto to positively hold the work piece on said pick-up means and retain the positive holding action when said pick-up means is moved from a horizontal to an oblique and from an oblique to a vertical position.

---

2,770,381
SUSPENSION APPARATUS FOR USE WITH LOAD CARRYING MECHANISM
John J. Hegarty, Medford, Mass.
Application July 2, 1954, Serial No. 440,963
7 Claims. (Cl. 214—731)

1. Suspension apparatus comprising a carriage supporting member embodying two sides laterally opposite each other, each said side embodying a pair of tracks at the upper and lower portions thereof, a suspension carriage movably supported by said supporting member and embodying two side suspension members and a connecting member attached to and extending between them, each said suspension member embodying a frame having two rollers rotatably attached thereto at upper and lower portions thereof which are respectively in contact with said upper and lower tracks, at the lower and upper edges respectively of the latter, and two braces pivotally mounted on said frame at an intermediate portion

thereof and extending therefrom in opposite directions, each said brace having a roller rotatably mounted thereon, said latter rollers being adapted to contact and move along said tracks when opposite thereto.

---

2,770,382
CONTAINER
Vaughn L. Ritter, Dunkirk, Ind., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania
Application August 13, 1952, Serial No. 304,089
6 Claims. (Cl. 215—31)

5. In a sealed glass container, the combination comprising a glass container having a continuous helical thread around the neck thereof, said thread having an uninterrupted undersurface and being provided with a plurality of radially outwardly extending projections located at different points around the periphery of the container, and a closure applied in sealing position on said container, said closure having a thread complementary to the thread on the container, said closure thread being in continuous engagement with the undersurface of the container thread and in engagement with the outwardly extending projections of the container thread at several points around the periphery of the container, no two of which points are diametrically opposed to one another.

---

2,770,383
PLASTIC MATERIAL BOTTLE-SEAL
Giorgio Livas, Milan, Italy
Application February 11, 1952, Serial No. 270,960
Claims priority, application France March 5, 1951
2 Claims. (Cl. 215—45)

2. A seal for insertion into the neck of a bottle, said seal comprising a substantially cylindrical hollow body fabricated of flexible, resilient material one end of said body being closed for insertion into a bottle neck, a laterally outwardly extending flange formed on said body adjacent the other end thereof and grasping means integral with and normally laying in the plane of said flange, said grasping means comprising a strip extending circumferentially about and having a relatively small segment secured to said flange, the unsecured portion of said strip being yieldingly displaceable out of the plane of said flange.

---

2,770,384
BOTTLE CLOSURE
Joseph B. Biedermann, Cincinnati, Ohio
Application June 8, 1953, Serial No. 360,225
2 Claims. (Cl. 215—36)

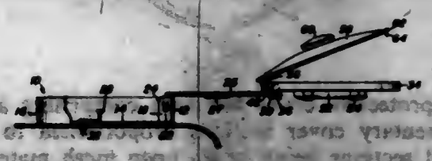
1. A removable closure for a bottle having a neck, an open mouth at one end of the neck, and a bead on the outside of the neck spaced from the mouth which comprises a one-piece body of elastomeric material having a plug adapted to be received inside the neck of the bottle and a cap portion for overlying the mouth of the bottle, said plug having an annular groove between the inner end thereof and the cap portion, the inner end portion of the plug being cylindrical and engageable with the inside surface of the neck of the bottle, the surface of the inner end of the plug being concave, thereby rendering the cylindrical portion deformable by pressure inside the bottle to firmly engage the inner surface of the bottle neck, the cap portion being provided with a diametrically extending slot, a one-piece pivot pin in said slot with ends of the pivot pin projecting on opposite sides of the cap portion, the cap portion being provided with a bore extending on both sides of the slot, an annular rim on the cap portion surrounding the bore, a pin retaining plate received in the bore overlying the pin and engaging the rim to hold the pin in the slot, and a cap retainer member pivotally mounted on said pin, said retainer member having a flange engageable with the bead of the bottle to hold the closure body with the plug inside the neck of the bottle and the cap portion in engagement with the mouth of the bottle.

---

2,770,385
OUTLET BOX
Ignatius C. Schultz, Conshohocken, Pa.
Application April 1, 1955, Serial No. 498,719
5 Claims. (Cl. 220—3.6)

1. In an electrical outlet box, a box having spaced side walls, clamping structure comprising a pair of levers pivoted intermediate their ends on said side walls, said levers having rear portions, and a cross member extending between and secured to said rear portions, said cross member being engageable with the back of a wall having an opening in which said box is to be positioned, said box having a front having lateral flange means thereon arranged to engage the front of the wall in opposition to said cross member.

---



2,770,386
MOLDED PLASTIC CONTAINERS AND METHODS OF MAKING THE SAME
Charles Mitchell, Lansing, and Edwin F. Beckman, Aurora, Ill., assignors to General American Transportation Corporation, Chicago, Ill., a corporation of New York
Application November 26, 1954, Serial No. 471,328
9 Claims. (Cl. 220—4)

1. In a container or the like, the combination comprising a shell including an elongated boundary wall provided with an elongated marginal edge having an elongated and longitudinally extending groove therein defining a pair of elongated and longitudinally extending side flanges disposed in laterally spaced-apart relation, an elongated and longitudinally extending reinforcing strip carried upon the marginal edge of said wall and provided with an elongated and longitudinally extending body disposed outwardly of said groove and carrying an elongated and longitudinally extending tongue projecting inwardly into said groove, the thickness of said wall between the opposite and laterally spaced-apart outer surfaces of said side flanges being substantially equal to the thickness of said body between the opposite and laterally spaced-apart outer surfaces thereof, the opposite outer surfaces of said side flanges and the opposite outer surfaces of said body being respectively disposed substantially flush with each other so as to provide respective smooth junctions therebetween, said tongue having a plurality of longitudinally spaced-apart holes extending laterally therethrough, and a plurality of longitudinally spaced-apart securing elements extending laterally through said holes and interconnecting said side flanges, said wall and said side flanges and said securing elements being of integral structure and formed of molded plastic material embedding said tongue and securely anchoring said strip in place.

---

2,770,387
VANITY CASE
Oscar L. Lowen, Kalispell, Mont.
Application October 31, 1955, Serial No. 543,944
3 Claims. (Cl. 220—18)

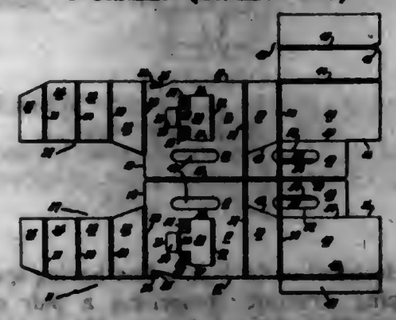
1. A vanity case comprising a hollow base adapted to be permanently connected to a supporting surface, a container pivotally movable from a position within said base to a position remote therefrom, linkage connecting said container to said base for said pivotal movement, a lid hingedly connected to said container, and means to lock said lid in closed position on said container, said lid being constructed and arranged to close both said container and said base when said container is positioned within said base.

---

2,770,388
ASH RECEIVER OR THE LIKE
George D. Lepp, Van Dyke, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application December 2, 1953, Serial No. 395,776
2 Claims. (Cl. 220—18)

2. Means for biasing members in rattle-free engagement during their relative movement and for limiting the extent of relative movement therebetween which includes, a leaf spring member having opposite ends bent and extended substantially at right angles, the one end of said spring member including means for securing said one end to one of said relatively movable members and the other end of said spring member being free to extend in spaced relation between said relatively movable members, spring fingers formed from the side edges of said free end of said spring member and extended in spaced relation thereto and out of the plane thereof towards the secured end of said spring member, the terminal ends of said spring fingers being bent up towards said free end of said spring member and the terminal end of said free end of said spring member being rolled over to provide stops adapted for engagement by said one movable member for limiting the open and closed disposition thereof relative to the other of said relatively movable members.

2,770,389
SCREEN COVERING FOR FRYING PANS AND THE LIKE
Anisis Drabeck, Hartford, Conn.
Application October 18, 1954, Serial No. 462,980
2 Claims. (Cl. 220—44)



1. A protective cover for pans comprising a pair of complementary cover sections proportioned to cover a pan, said sections being of an open mesh material, and means connecting the sections for relative movement between a position in which said sections completely cover said pan, and a position in which the pan is partially uncovered, said means comprising a pair of spaced pins on which the sections are mounted to slide independently of one another, the sections having overlapping portions through which said pins extend, said overlapping portions being formed with spaced slots, with each pin extending through one slot of one section and one slot of the other section, the slots through which each pin extends being aligned longitudinally.

2,770,390
SAFETY CONTAINER
Constantino Liscioni, Chicago, Ill., assignor to The Protectoseal Company, Chicago, Ill., a corporation of Illinois
Application June 28, 1952, Serial No. 294,754
5 Claims. (Cl. 220—88)

1. In a device of the class described, and in combination, a bench can, a closure for the can hingedly connected thereto by a hinged connection, a support base comprising a plate-like member underlying the bench can for supporting the bench can, said support base including stop means comprising an integral overlying portion extending substantially parallel to the axis of the hinged closure and spaced from the bench can and for supporting the closure in its opened position, a bracket member mounted on the support base laterally of the bench can, a thermally responsive release means comprising a fusible link operatively affixed within the container, hook means operatively affixed to and within the bench can, a second hook means oppositely positioned with respect to the first-mentioned hook means and operatively extending through the peripheral wall of the bench can, said fusible link complementally formed to and detachably connected at one end to the first-mentioned hook means and at the opposite end to the second-mentioned hook means, spring-biased pusher means including the second hook means and operatively mounted with respect to the bench can, the bracket member and the closure, said spring-biased pusher means operatively connected to the second-mentioned hook means, and said spring-biased pusher means adapted upon the melting of the fusible link to bias the closure to move the closure to its closed position from its open position abutting the stop means.

2,770,391
NON-RETURNABLE BOTTLE CARRIER
Henry L. Metzger, Castleton-on-Hudson, N. Y., assignor to Fort Orange Paper Company, Castleton-on-Hudson, N. Y., a corporation of New York
Application May 19, 1954, Serial No. 428,522
3 Claims. (Cl. 220—113)

1. A single die-cut and scored blank of paper-board material to be folded and secured together in collapsed form for use, when opened, as a non-returnable bottle carrier, which comprises a rectangularly shaped panel divided into two identical portions along a first transverse score line to provide two connected, integral longitudinal partition sections and inner carrying handle sections, foldable along said score line and securable to each other; a T-shaped transverse partition section centrally cut from within the confines of each longitudinal partition section, and providing a T-shaped opening therein, but hingedly connected thereto and securable to an opposite side wall of said carrier, each carrying handle section having a hand-hold therein adjacent said T-shaped opening; a first elongated panel section laterally extending from the same side of each longitudinal partition section, each said first panel section being divided along transverse score lines into an end wall section, an end wall extension, a transverse partition section as wide as its end wall section and as long as a side wall, and a glue flap respectively, the latter being securable to an opposed longitudinal partition section centrally to overlie said T-shaped opening as a barrier between opposed bottles, and said end wall extension being securable to an opposed side wall section; a second elongated panel section laterally extending from the opposite side of each longitudinal partition section, each said second panel section being divided along a transverse score line into an opposite end wall section and a side wall; a bottom panel hingedly connected to the bottom of one of said side walls and securable to the bottom of the opposite side wall; and a third elongated panel section laterally extending from said handle carrying sections, between each said second panel section and being severed therefrom and from said adjacent end wall section, said third panel being divided by a second transverse score line, coaxial with said first transverse score line, into outer carrying handle sections, having hand-holes therein, foldable along said second transverse score line, and securable to said inner carrying handle sections with all said hand-holes in alignment.

2,770,392
METHOD FOR FEEDING ARTICLES IN PREDETERMINED QUANTITIES
Franklin B. Roberts, Springfield, Mass., assignor to Package Machinery Company, East Longmeadow, Mass., a corporation of Massachusetts
Application February 16, 1950, Serial No. 144,563
1 Claim. (Cl. 221—1)

A method of feeding a predetermined quantity of relatively thin, fragile articles from a stack which comprises, supporting the stack on a vertically reciprocable support, lowering the support and the stack of articles thereon a predetermined distance, clamping the stack of articles above the support at a point sufficiently above the topmost article of the quantity to be fed to leave a surplus of articles on the support, lowering the support a further distance, inserting a separator between the edge of the topmost article of said quantity and the edge of the article immediately above said topmost article, lowering the support a further distance while holding the separator stationary to lower the rear edges of the surplus articles above the separator and position said surplus articles in an inclined position, advancing a secondary support beneath the surplus articles at an elevation to engage the articles rearwardly of their center to thereby raise the surplus articles to substantially the level of the separator, withdrawing the separator to permit the surplus articles to rest on the secondary support, moving the group of articles transversely from the first support, raising the latter into engagement with the surplus supported on the secondary support, raising the first support a further distance to raise the surplus from the secondary support and into proximity with the bottom of the clamped stack and unclamping the stack to permit the latter to descend onto the surplus to be again supported by the first support.

2,770,393
DISPENSING OR VENDING MACHINE
Ronald Gale, Elgin, Ill., assignor, by mesne assignments, to Universal Vendor Company, Elgin, Ill., a corporation of Delaware
Application February 1, 1952, Serial No. 269,469
6 Claims. (Cl. 221—67)

1. In an article dispensing device for a storage cabinet having a plurality of vertically spaced racks inclining downwardly toward a vertical well in the cabinet, spaced depending guide plates defining the lower end of the well, a dividing member disposed below the well and intermediate the guide plates, a pair of vaned members rotatably mounted below the storage cabinet on opposite sides of the dividing member and spaced therefrom with the vanes on said members asymmetrically arranged, means connecting said vaned members for causing simultaneous opposite rotation of said vaned members, said vaned members and said dividing member cooperating to successively dispense articles from the vertical well each time said vanes are rotated through a predetermined arc, said articles being dispensed alternately from opposite sides of the dividing member, the weight of the articles in said vertical well tending to cause said vaned members to rotate, locking mechanism for controlling the arc of travel of said vaned members, and means for actuating said locking mechanism to release said vaned members for rotation and dispensing an article.

2,770,394
METHOD AND APPARATUS FOR DISPENSING A MEASURED AMOUNT OF BEVERAGE INGREDIENTS
Richard J. Mueller, Franklin Park, Ill., assignor to Automatic Canteen Company of America, Inc., Chicago, Ill., a corporation of Delaware
Application May 4, 1954, Serial No. 427,469
9 Claims. (Cl. 222—1)

1. A process of measuring and dispensing a measured amount of a flowable material which comprises forcing

said flowable material into a measuring chamber one side of which is displaced to a predetermined position in response to the pressure exerted thereon by said material and against a gaseous back pressure smaller than said displacing pressure, and reducing said displacing pressure below said back pressure to cause said displaced side of said chamber to move in the reverse direction in response to said back pressure to dispense said material from said chamber.

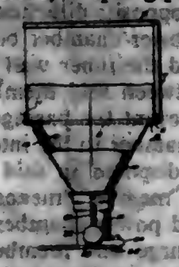
---

**2,770,396**
**PORTIONING DEVICE FOR VISCOUS MASSES**
Wilhelm Schmidt, Bromma, Sweden, assignor to International Ytong-Stabenfeldt Company Ltd., London, England, a corporation of Great Britain
Application January 27, 1953, Serial No. 333,593
Claims priority, application Sweden February 7, 1952
5 Claims. (Cl. 222—23)

1. In a device for measuring predetermined volumes of viscous substances comprising a vessel, a lining disposed within said vessel, the lining being of an easily deformable material and forming two chambers within said vessel, an outer expansion chamber between the lining and the walls of the vessel and an inner portioning chamber within the lining, means including a meter connected to the expansion chamber for admitting a predetermined volume of fluid to the expansion chamber whereby the volume of the portioning chamber is established at a predetermined value, means for filling the portioning chamber with the viscous substance to be measured, and means independent of said last-named means for drawing off the measured volume of the viscous substance.

---

**2,770,397**
**LIQUID MEASURING AND DISPENSING APPARATUS**
Robert K. Gallaway, Hoopeston, Ill., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application October 5, 1953, Serial No. 384,699
6 Claims. (Cl. 222—168.5)

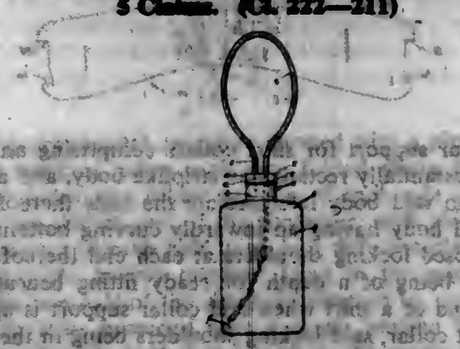


1. Apparatus for measuring and dispensing liquid comprising a measuring receptacle having an inlet port in a wall thereof, a sleeve having a port therein reciprocably mounted in the receptacle so as to close the inlet port thereof when in one position and to open said inlet port when in another position, said sleeve comprising a bore including a lower portion of predetermined diameter and an upper portion of larger diameter, a valve head fitted to the bore of said sleeve for entry bodily thereinto, and means for mounting said valve head in position to seat within the lower portion of said bore to close the bore of said sleeve when the sleeve is in said port opening position and to be received by the upper portion of said bore to open the bore when the sleeve is in said port closing position.

---

**2,770,398**
**DEVICE FOR DISPENSING MEASURED QUANTITIES OF GRANULAR MATERIAL**
Edward E. Sanderson, Detroit, Mich.
Application November 2, 1953, Serial No. 389,670
1 Claim. (Cl. 222—281)

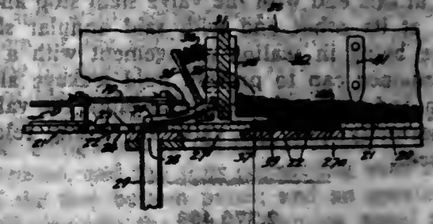
A device for dispensing measured quantities of granular material comprising a bracket formed of a vertical rear wall engageable with a vertical support, an upper horizontal wall projecting from said rear wall and engageable over the inverted bottom of a container, a lower horizontal wall projecting from said rear wall, the inverted open top of said container engaging on said lower wall, said lower wall having an opening extending inwardly from the front edge thereof, a conical member fixed to and depending from said bottom wall, a cylindrical delivery member fixed to the lower end of said conical member, a spring-pressed valve plate in



the upper end of said delivery member, a rock shaft fixed to said valve plate, a right-angled arm extending from one end of said shaft, a weight on said arm gravitatingly maintaining said valve plate in closed position, a second valve plate bearing against the lower end of said delivery member, means pivotally securing said second valve plate to said delivery member, and a handle projecting from said second valve plate.

---

**2,770,399**
**FLEXIBLE SELF-SEALER OILER AND FLUID DISPENSER**
Charles H. Gross, Detroit, Mich.
Application December 1, 1953, Serial No. 395,375
5 Claims. (Cl. 222—211)



1. A resilient self sealer fluid dispenser adapted for controlled, restricted discharge of fluid by externally applied pressure, and used with selected fluid, comprising a closed, resilient, hand pressure fluid container made of plastic material and formed with an open neck section leading therein, a suitable stopper plug formed with tube opening, fixedly mounted within said open neck section, a small, elongated flexible plastic fluid discharge tube tightly, but adjustably mounted through said stopper plug tube opening and projected within the container chamber a predetermined length, also extended outside the supporting stopper plug, designed for discharge of the container fluid therethrough when hand pressure is applied to the container walls, and tube supporting pin means mounted on said stopper plug for self sealing the discharge tube when not in operation.

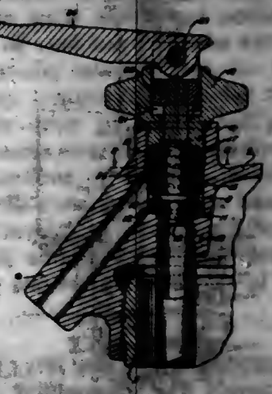
---

**2,770,400**
**SEED SEPARATING AND FEEDING MECHANISM**
Eddie F. Nielsen, Gresham, N. Dak.
Application November 18, 1954, Serial No. 469,715
3 Claims. (Cl. 222—222)

1. In a seed planter the combination of a frame, a seed-carrying hopper having a bottom and having generally upright side walls including a discharge seed-delivery portion adjacent said bottom, each of said side walls having an inner side and an outer side, one of said side walls having an elongated slot extending horizontally throughout the length thereof and adjacent said bottom, an elongated, flexible driving element extending horizontally along said last mentioned side wall and adjacent said slot therein, engaging means mounted on said frame and connected with said flexible element for guiding the same, said engaging means being adapted for connection with a source of power for driving said flexible element,

a flat seed-delivery conveyor secured to said flexible driving element and extending laterally outwardly therefrom and inwardly of said hopper through said slot, said conveyor being supported on said bottom and having a plurality of seed-receiving chambers each communicating with the interior of said hopper for receiving a seed therefrom, and delivery means mounted on said frame and being operatively connected with said conveyor for receiving seeds therefrom and delivering the same to the ground for planting.

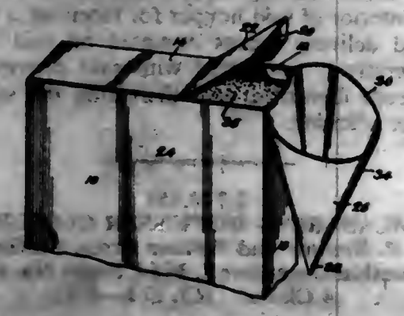
---



**2,770,401**
**MEASURING DISPENSER CLOSURE**
Orlestus R. Brenner and William Bross, Cincinnati, Ohio
Application December 7, 1954, Serial No. 473,544
4 Claims. (Cl. 222—339)

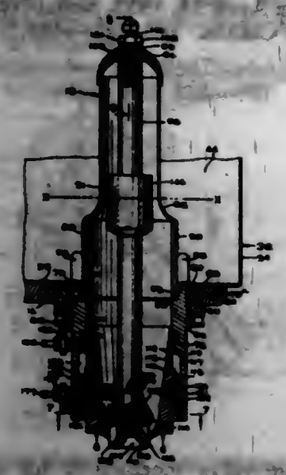
1. A closure cap comprising a housing having a neck attachable to a container, an arcuate slot in said housing above said neck, said housing provided with a passage connecting said arcuate slot with said neck, a sliding member movable endwise in said arcuate slot, and a measuring cavity in said member co-operating with said passage.

---



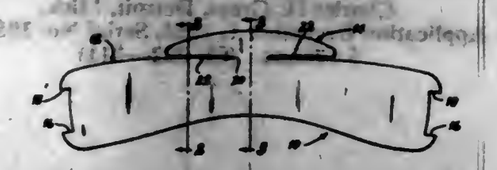
**2,770,402**
**DISCHARGE VALVES FOR PRESSURE JUGS**
Ronald F. Quam, Fort Atkinson, Wis.
Application April 18, 1955, Serial No. 502,166
3 Claims. (Cl. 222—400.7)

1. A discharge valve mechanism for controlling the discharge of fluid from a container having an end, comprising a cap mounted on an end of the fluid container, a valve stem reciprocatably mounted through said end-



taner cap, the container cap being provided with a discharge chamber into which said valve stem extends and the valve stem being formed with a stop, the discharge chamber being formed with a valve seat, and a wall portion of the cap adjacent the chamber having an annular shoulder, a valve carried by an inner portion of the valve stem movable into and out of engagement with said valve seat, and a generally cylindrical resilient sealing sleeve surrounding portions of the valve stem and in engagement at one end with the valve stem stop and in engagement at its other end with said annular shoulder, said sleeve being in sealing engagement with a portion of the container cap to prevent fluid leakage along the valve stem and resiliently reacting against the valve stem stop to normally hold the valve in closing relation to the valve seat.

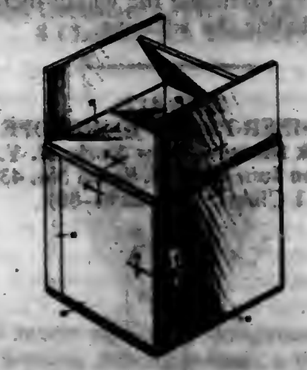
2,770,403
COMBINED DISPENSING CARTON AND ATTACHED COLLAPSIBLE MEASURING CUP
Dorothy L. Eckley, Denver, Colo.
Application January 24, 1955, Serial No. 483,590
6 Claims. (Cl. 222—424.5)



1. A dispensing container and measuring device comprising in combination: a dispensing container provided with a pour opening; and, a measuring cup attached along a portion of the rim thereof to the container and suspended beneath the pour opening in position to receive the contents of said container when dispensed through said pour opening, said cup being foldable into collapsed position following each use without detaching same from the container.

2,770,404
FILLING VALVE
Robert K. Galloway, Hoopeston, Ill., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application December 1, 1952, Serial No. 323,406
2 Claims. (Cl. 222—448)

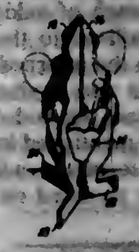
2. A liquid dispenser comprising a housing having a hollow interior affording a reservoir for liquid and having an opening in one wall, a member disposed across said opening having side walls in sliding sealing engagement with the inner walls of said housing and a bottom wall with a discharge port through which liquid may be discharged from said reservoir, a valve seat formed in said member around said discharge port, a valve arranged to engage said valve seat in liquid-tight engagement, said member being movable in one direction for moving said valve seat into engagement with said valve and movable in an opposite direction to unseat said valve, means defining a power chamber between the outer wall of said member and the inner wall of said housing, seal means disposed between said member and said housing and arranged to prevent the passage of pressurized fluid from said power chamber to the interior of said housing, an annular flange disposed in said power chamber and connected to said member, means for directing pressurized fluid to said power chamber on one side of said annular flange to urge said member in said one direction, and means for simultaneously releasing the pressurized fluid on said one side and directing pressurized fluid to said power chamber on the other side of said annular flange to urge said member in said opposite direction.



2,770,405
SHIRT COLLAR SUPPORT
Richard N. Williams, St. Louis, Mo., assignor to R. N. Williams Paper Company, St. Louis, Mo., a corporation of Missouri
Application June 12, 1953, Serial No. 361,298
1 Claim. (Cl. 223—69)

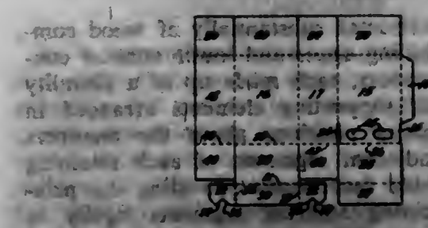
A collar support for shirt collars comprising an elongated substantially rectangular striplike body, and a wing secured to said body intermediate the ends thereof, said elongated body having an inwardly curving bottom edge and opposed locking shoulders at each end thereof, each shoulder being of a depth for ready fitting beneath the collar band of a shirt when said collar support is applied to a shirt collar, said locking shoulders being in the same plane with said elongated body, said locking shoulders being in a plane at substantially right angles to the body of a shirt when inserted in a shirt collar, and said wing being connected to said body by a neck portion and being separated from said body at each side of said neck portion by a slot, said wing being substantially narrower in width than the body and of a length less than half of the length of said elongated body.

2,770,406
CARTON CONSTRUCTION
Gardiner Lane, Darien, Conn., assignor to St. Regis Paper Company, New York, N. Y., a corporation of New York
Application June 28, 1954, Serial No. 439,765
7 Claims. (Cl. 229—3.5)

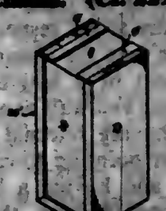


1. A collapsible carton formed by folding a carton blank, characterized in that the blank constitutes a sandwich having two spaced-apart sheets of paper or the like and the space therebetween being filled with a layer of foamed compressible plastic material containing many thousands of gas cells per cubic centimeter, the opposite surfaces of which layer respectively are secured throughout to such sheets, the corners for the carton being formed along narrow bands at which the plastic material is permanently compressed to a substantially non-foamed and substantially higher density than the other areas, the sandwich along said corners being sufficiently flexible to permit free bending for the formation of at least 90° corners without rupture of the foamed layer or said sheets as secured thereto, but the foamed layer in the main wall

areas of the carton being relatively uncompressed and said areas being relatively non-resilient and rigid against deflection and the foamed layer therein being subject to fracture upon substantial bending.



2,770,407
CONTAINER
Carl S. Dehm, Kearny, N. J.
Application June 25, 1952, Serial No. 295,453
8 Claims. (Cl. 229—8)

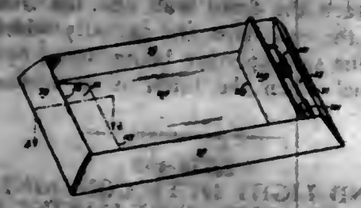


1. An ornamental container formed with a plurality of joined identical sides, each side folded along its longitudinal center, the folded portion of each side lying adjacent the central axis of the container, each side having two halves and each half lying in a different plane, each adjacent side having one-half lying in the same plane with the one-half of the side it is adjacent to, said joined identical sides provided with a single portion that is a portion of each half that is not in the same plane as either half and protrudes from the face of each half to form an article holder.

2,770,408
CONTAINER-FEEDER
Robert G. Lindeberg, St. Paul, Minn., assignor to Minnesota Mining & Manufacturing Company, St. Paul, Minn., a corporation of Delaware
Application August 23, 1952, Serial No. 305,980
2 Claims. (Cl. 229—17)

1. As a combined packaging and dispensing carton and feeding trough for flowable granular material, a carton having four vertical walls and a bottom closure; the said bottom closure comprising a first panel hinged to the bottom of the front wall and extending to the rear wall to form the inside bottom surface of the carton, a second panel hinged to the bottom of the rear wall and extending underneath the first panel to a position below the front wall, a trough-forming panel hinged to the front edge of the second panel and extending upwardly therefrom in front of the front wall, two end flaps hinged to the two ends, respectively, of the trough-forming panel, two vertical slots in the walls at the front corners of the carton to receive the two end flaps, respectively, stop members on the end flaps to engage the walls when the flaps are partially withdrawn from the carton a given distance, and two side closure flaps hinged to the bottom edges of the two side walls, respectively, each extending across the bottom of the carton underneath the second panel toward the opposite side wall to form the outside bottom surface of the carton; the front and rear walls and the first and second bottom panels being of equal width, the said width being equal to the lateral extent of the trough-forming panel, and the slots connecting with the lateral edges of the first bottom panel; and an aperture in the front wall opposite the trough-forming panel to permit the contents of the carton to flow into the trough that is formed between the front wall and the trough-forming panel when the end flaps are partially withdrawn from the carton, the said aperture being closed by the trough-forming panel when the latter is in contact with the front wall.

2,770,409
HEAVY AND LIGHT DUTY CONTAINER STRUCTURE AND METHOD OF MAKING SAME
George Arlington Moore, New York, N. Y.
Application March 5, 1954, Serial No. 414,242
12 Claims. (Cl. 229—23)



1. A container of sheet material comprising a body of substantially rectangular cross section having four side walls arranged in opposing pairs, one pair having a bridged flat end wall of uniform single thickness and being integrally related with said pair of side walls, each of said walls having free end sides provided with continuous marginal flange portions bent inwardly at right angles of their corresponding walls, the other pair of said side walls having an alternate bridged flat end wall of uniform single thickness and being integrally related with corresponding side walls, said alternate end wall having two substantially parallel straight side edges spaced inwardly and parallel to interior surface portions of the first mentioned side walls to provide a pair of slot openings for access into the interior of the container, the first mentioned pair of side walls and flange portions being extended outwardly of said end wall, the extended flanged portions being partially severed from the side wall portions with slit lines terminating adjacent the surface of said end wall, the other of said flange portions being disposed in continuous overlapping relationship with exterior marginal portions of the last mentioned pair of other side walls, the overlapping parts being secured together in seam forming relationship after which, said extended side wall and severed flange portions provide means for closing and sealing said pair of slot openings.

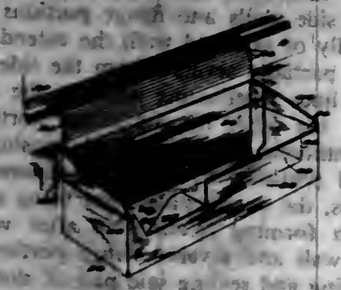
2,770,410
HOLLOW-WALLED BOXES
Marshall L. Williamson, New Haven, Conn.
Application April 14, 1953, Serial No. 348,739
5 Claims. (Cl. 229—34)

1. A hollow walled folding box comprising, in combination, a main panel; a pair of side wall structures on oppo-

side sides of the main panel, a pair of end wall structures at opposite ends of the main panel; and corner structures between said side wall structures and said end wall structures; each of said side wall structures comprising, an outer side wall panel articulated to said main panel along an outer side fold line; an inner side wall panel articulated to said outer side wall panel along a side ridge fold line; and a bottom side panel articulated to said inner side wall panel along an inner side fold line and extending outwardly toward said outer side fold line in the set-up box; each of said end wall structures comprising, an outer end wall panel articulated to said main panel along an outer end fold line; an inner end wall panel articulated to said outer end wall panel along an end ridge fold line; and a bottom end panel articulated to said inner end panel along an inner end fold line, said bottom end panel extending outwardly toward said outer end fold line in the set-up box; each of said corner structures comprising at least one corner panel articulated to one of the wall panels of one wall structure along a fold line aimed at the ridge

fold line of said one wall structure, said corner panel lying, in the set-up box, between the outer wall panel and the inner wall panel of the other wall structure meeting said one wall structure at the respective corner; a liner panel of a width greater than the distance between the inner side wall panels and of a length greater than the distance between the inner end wall panels, considering the set-up box, said liner having internal flaps cut from its stock, said internal flaps pointing towards the proximate end edges of the liner and having a hinge line substantially parallel to, and spaced from, the inner end panel of the box, the end edges of the flaps being substantially parallel and spaced from each other a distance equal to the distance between the inner end panels of the box; and bottom tabs on the end wall structures, said bottom tabs extending at right angles to the inner end wall panels and in the opposite direction as the bottom end panels, said liner underlying said bottom side panels and said bottom end panels, said tabs underlying said liner flaps at the end edges of said flaps.

---



2,770,411

**SELF-SUSPENDING DISPOSABLE SERVICE BOX**

Kenneth H. MacKay, Ocala, Fla.

Application December 1, 1952, Serial No. 323,397

11 Claims. (Cl. 229—43)

1. A self-suspending, disposable service device comprising an elongated, rectangular paper box open at the top side and having an integrally joined closure flap extending along one longitudinal edge of the open top side, said closure flap being of a width to provide a free marginal portion adapted to be folded against the upper marginal portion of the other longitudinal edge when the box is closed, and a substantial area of pressure sensitive adhesive extending lengthwise of the outer face of the closure flap inwardly of the free foldable marginal portion, the inner face of the closure flap having a plurality of rows of scoring extending the length thereof throughout the area including the adhesive.

---

2,770,412

**TAMPER-PROOF ENVELOPE**

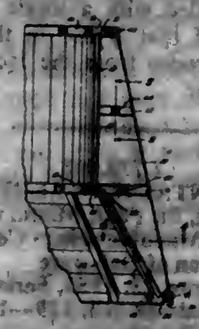
Mark Ellwood, New York, N. Y.

Application June 2, 1954, Serial No. 433,992

1 Claim. (Cl. 229—90)

A tamper-proof envelope comprising a rectangular front wall having an inturned flap at one end affixed to the inner adjacent end of said front wall, and another flap at its other end gummed on both surfaces, a rectangular back wall comprising two panels each having one of their longitudinal edges formed integral with the respective longitudinal edges of said front wall, said panels extending over said front wall, each of said panels having an inturned flap at one end affixed to the adjacent wall of the associated panel and to the inturned flap at the end of said front wall, said panels also having inturned flaps at the other end thereof adjacent the said other gummed flap of said front wall, said last mentioned inturned flaps being affixed to the inner surface of the adjacent end of the associated panel and being gummed on the other surface thereof.

---



2,770,413

**WOOD FAN RING**

Helen E. Grantham and John L. Goldsmith, Houston, Tex., assignors to Hudson Engineering Corporation, Houston, Tex., a corporation of Texas

Application February 1, 1952, Serial No. 269,562

19 Claims. (Cl. 230—133)

1. A fan ring constructed substantially of wood comprising a frame including upper and lower annular concentric retaining members, each made up of a plurality of segments; upright supporting elements arranged in circumferentially spaced positions about the members with one between adjacent segments of each retaining member; separate hold fast means providing the principal means of securing adjacent segments rigidly to each other and to an upright supporting element therebetween independently of the other similar joints of the fan ring; a plurality of staves; and stave receiving and retaining means carried by the retaining members for receiving and retaining the staves between said members in snug, upright, side-by-side relationship in the form of a substantially cylindrical shell.

2,770,414

**VACUUM PUMP**

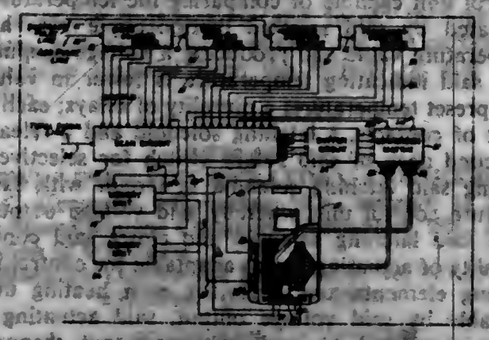
Marvin Skolnik, Cleveland Heights, Ohio, assignor to The Weldon Tool Company

Application December 4, 1952, Serial No. 324,985

8 Claims. (Cl. 230—149)

1. A fluid motor or pump, comprising, a housing, a wall in said housing defining a bore, a rotor rotatable in said bore, one of said rotor and housing having a cam surface, the other of said rotor and housing having slots and blades slidable in said slots, spring means engaging said blades to urge same into engagement with said cam surfaces, said blades in co-operation with said cam surface dividing said bore into first and second variable volume chambers, engagement of said blades with said cam surface forming first and second interfaces, an inlet port adjacent one blade and an outlet port adjacent the other blade in each chamber, means connecting said outlet ports together and to a liquid storage tank, means introducing into said first chamber a first fluid exclusively and means introducing into said second chamber passing a second different fluid exclusively, seal means including said exclusive circulation of said second fluid through said second chamber sealing said first and second interfaces thereby maintaining a high pressure differential between said first and second variable volume chambers.

---



2,770,415

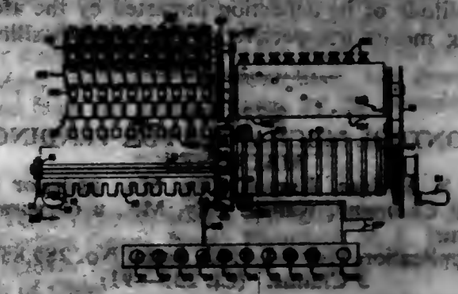
**READ-OUT AND RADIX CONVERSION APPARATUS FOR ELECTRONIC COMPUTING APPARATUS**

John L. Lindenmeier, Sierra Madre, Calif., assignor to Clary Corporation, a corporation of California

Application December 3, 1951, Serial No. 259,568

21 Claims. (Cl. 235—61)

1. A computing device comprising the combination of a multi-denomination counter, means for successively actuating said counter to enter digital values thereinto, a multi-denomination accumulator, means responsive to a tens carry-over operation from a predetermined denomination only of said counter and during a counting operation of said counter for actuating a denomination of said accumulator corresponding to one denomination higher than said first predetermined denomination to enter the digit one therein, and selectively operable means controlled by said predetermined denomination and all lower denominations of said counter and operable after said counting operation for actuating the remaining lower denominations of said accumulator whereby to transfer amounts from said counter to said accumulator.



2,770,416

**CALCULATING MACHINE**

George W. Hawkins, San Leandro, Calif., assignor to Friden Calculating Machine Co., Inc., a corporation of California

Application April 13, 1951, Serial No. 220,989

11 Claims. (Cl. 235—61)

3. In a calculating machine, an accumulator, a supporting shaft for the said accumulator, a plurality of numeral wheels rotatably mounted on the said shaft, a magnetic clutch for each numeral wheel adapted to be driven by the said shaft to effect registration in the said accumulator, each such clutch including a permanently magnetized driving element mounted for rotation with the said shaft, a complementary clutch follower element adapted to be magnetically driven thereby, the said follower element being mounted on its corresponding numeral wheel for rotation therewith, and an ordinally arranged escapement mechanism including an electromagnet in each order for controlling step-by-step driving engagement of each such permanently magnetized element with its complementary clutch follower element, and mechanism for supplying counting pulses to the said electromagnets comprising, a series of ordinally-spaced pickup coils, a plural order magnetic record-receiving means mounted for rotation with respect to said coils, means for ordinally shifting said record-receiving means, means for recording a figure in said record-receiving means by magnetizing said record-receiving means so that for each digit of the figure there is a corresponding portion of the record-receiving means, and means for rotating said record-receiving means so that in each order thereof containing a magnetically-recorded number a corresponding number of pulses of current will be induced in the ordinally related pickup coil and transmitted to the electromagnet which controls the escapement mechanism in that order.

2,770,417

**ELECTRONIC DISTRIBUTOR FOR COUNTING AND SIMILAR PURPOSES**

Paul François Marie Chenau and Jean Arthur Marie Louis Gallavardin, Paris, France

Application June 2, 1949, Serial No. 96,146

Claims priority, application France July 7, 1948

15 Claims. (Cl. 235—92)

1. In an electric step by step type pulse distributor, a cathode ray tube, means inside said tube for producing an electron beam and for directing said beam along a predetermined reference axis, a plurality of targets located inside the tube and around said axis for receiving the beam, a plurality of deflecting means arranged around the said axis so as to deflect the beam in different radial planes

extending through said axis and said targets, means to connect separately and directly each target to the corresponding deflecting means located in the same radial plane, a supplementary starting target located in said reference axis, connected to one of said targets and independent means under control of the incoming pulses to be distributed for acting upon the beam so as to change the amplitude of its deflection imparted by the aforesaid deflecting means irrespective of the beam position.

2,770,418

**CONTROL MECHANISM FOR VENDING MACHINES**

Charles S. Hodges, Kansas City, Mo., assignor to The Vendo Company, Kansas City, Mo., a corporation of Missouri

Application May 24, 1952, Serial No. 289,858
3 Claims. (Cl. 235—91)

1. In a control mechanism having a rotatable index disc provided with a stop and a movable latch engageable with the stop; structure for imparting step-by-step, rotative movement to the disc, said structure comprising in combination a stub shaft; a ratchet wheel, a pinion, and a plate element all rotatably mounted on said shaft, the pinion and the ratchet wheel being interconnected; a gear secured to the disc in mesh with the pinion; an oscillatable shaft; a member mounted on the oscillatable shaft and having a pin thereon; spring means connected with said element and yieldably holding the latter biased against the pin; and a spring-loaded pawl on the element and engageable with the ratchet wheel for rotating the latter to rotate the pinion, the gear and the disc as the pin is oscillated to swing the element against the action of said spring means.

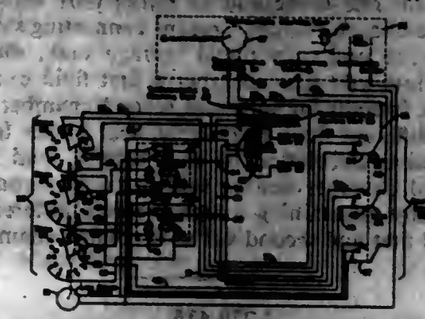
2,770,419

**KEYBOARDS FOR CALCULATING MACHINES**

Colin L. Campbell, Fontana, and Smith Lee, West Covina, Calif., said Lee assignor to said Campbell

Application September 19, 1950, Serial No. 535,077
8 Claims. (Cl. 235—145)

1. In a calculating machine of the key-set type having power drives, cyclic actuating means and a plurality of different arithmetical function-controlling means, a keyboard comprising, in combination: an upper keyboard plate; a plurality of value keys having key stems extending through openings in said plate and depressible for setting up amounts to be entered into the machine upon a cyclic operation thereof; means for latching said keys in depressed setup condition, said keyboard openings for the key stems being shaped and enlarged, relative to the cross section of the key stems, to permit limited amounts of tilting movements from normal latched position of the key stems therein relative to the keyboard plate, optionally in a plurality of different directions; electronic means, normally functionally inoperative, adapted for selectively initiating action of a plurality of said different function-controlling means; and means, operative upon tilting of a latched value key in an optionally selected direction from normal position, for rendering said electronic means operative to initiate action of the selected function-controlling means.



---

2,770,420

**MULTIPLE TEMPERATURE CONTROL DEVICE**

Kenneth P. Potter, Indianapolis, and Guy R. Stutzman, Greenwood, Ind.

Application July 29, 1955, Serial No. 525,405
2 Claims. (Cl. 236—15)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A temperature control device for regulating a plurality of heating units having heating elements comprising; a voltage supply; a plurality of thermocouples for indicating temperature, one each adapted for temperature indication in each of a plurality of heating units; a rotary switch having a plurality of decks, one deck for selectively connecting said thermocouples with a temperature control unit capable of comparing the temperature value indicated by said selected thermocouple with a preset temperature value and producing a voltage output whenever said indicating temperature is lower in value than said preset temperature; a plurality of relays; each having a set of contacts, a latching solenoid and a release coil; a second deck of said rotary switch for selectively connecting said latching solenoid in circuit with said temperature control unit whereby said voltage output energizes said latching solenoid and closes said contacts; a plurality of actuating means adaptable for controlling said heating elements, one each for each heating unit and operable by said voltage output, said actuating means being connected to said voltage output through said selected relay contacts; and a third deck of said rotary switch for selectively connecting said voltage supply in circuit with said release coils after said latching solenoid is connected in circuit with said temperature control unit.

---

2,770,421

**RAILWAY-TIE PAD**

George A. Wilson, Weston, Mass., assignor to Fabreeka Products Company, Boston, Mass., a corporation of Massachusetts

Application May 19, 1954, Serial No. 430,321
6 Claims. (Cl. 238—283)

1. A railway tie pad comprising a body layer of vulcanized rubber having fibrous material embedded therein, a tie-contacting bottom layer bonded to the body layer, said tie-contacting layer being relatively thin as compared with the body layer, the tie-contacting layer being weather-impervious and sticky, within the upper limits at least of the normal range of climatic temperatures, and a top layer relatively thin as compared with the tie-contacting layer and integral with the body layer, the outer surface of said top layer being adhesive.

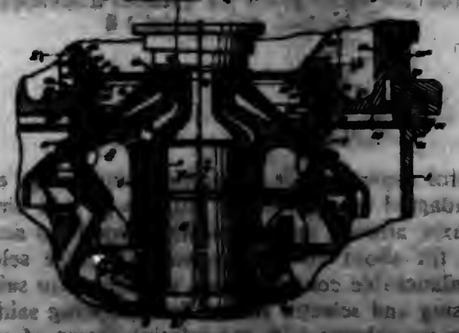
2,770,422

**PLURAL STAGE - RECIPROCATING - PUNCH CRUSHER FOR FRANGIBLE MATERIALS**

Julius A. Hjalmar, Palos Heights, Ill., assignor to Crane Co., Chicago, Ill., a corporation of Illinois

Application June 8, 1955, Serial No. 513,932
7 Claims. (Cl. 241—147)

1. In an apparatus for reducing the size of frangible material, the combination comprising a plurality of plate members, a reciprocally movable punch plate cooperating with said plate members, said plate members having a plurality of tooth-like protuberances disposed along the lower edges thereof, means fixedly maintaining said plate members substantially vertical to said reciprocally movable punch plate, punch means affixed to said reciprocally movable punch plate, said punch means entering the interstices defined by said tooth-like protuberances and effecting a shearing relationship therewith whereby frangible material interposed between said interstices and said punch means is fragmentated and forced through said interstices, means adapted to remove the fine particles of said frangible material from the vicinity of said fragmentation.



---

2,770,423

**BOWL LINER FOR GYRATORY CRUSHERS**

Oscar C. Gruender, Milwaukee, Wis., assignor to Nordberg Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin

Application October 28, 1952, Serial No. 317,193
8 Claims. (Cl. 241—299)

1. In a bowl liner for gyratory crushers and the like, a body portion having a generally conic upper surface and having an upward extension from the upper inner edge of said conic upper surface, said upward extension having a circumferential outer channel therethrough located at a level above the plane in which the inner edge of said conic upper surface terminates, said circumferential channel being upwardly bounded by an outwardly extending locking flange, the exterior diameter of which approximates the diameter of the upper inner edge of said conic upper surface and an outwardly extending, centering, flange carried by said upward extension and having an outer surface located above the upper-most part of the conic upper surface of the bowl liner, but downwardly separated from the locking flange by the circumferential channel.

2,770,424

**AUTOMATIC STATOR WINDING MACHINE**

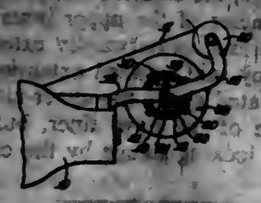
Frank Carlton Grove, North Plainfield, N. J., assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application April 6, 1953, Serial No. 346,904
13 Claims. (Cl. 242—1)

2. In a electromagnetic core winding machine, a core support mounted for oscillatory movement about a vertical axis, a wire laying needle, means for reciprocating said needle vertically through a core on said support and for projecting said needle radially of a core adjacent the upper and lower limits of its movement, a lower forming member mounted below and in spaced relation to a core on said support and having a slot to receive said needle when projected, an upper forming member having a slot to receive said needle when projected, means for moving said upper forming member to and from an operative position spaced from a core on said support and within the limits of the reciprocating movement of said needle and an inoperative position away from said core support, means for oscillating said core support while said needle is above and below a core thereon, drive means for actuating said needle and said oscillating means, control means for energizing said drive means to lay wire in a core according to a predetermined plan and for de-energizing said drive means and for actuating said moving means to move said upper forming member to said inoperative position at the termination of a winding operation.

---

2,770,425



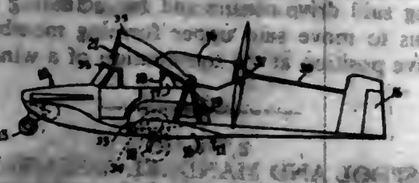
**SPOOL AND MANDREL ASSEMBLY**

Glenn Richard Lee, Kokomo, Ind., assignor to Continental Steel Corporation, Kokomo, Ind., a corporation of Indiana

Application September 28, 1954, Serial No. 458,772
7 Claims. (Cl. 242—46.3)

1. A spool and mandrel assembly comprising, an annular ring mounted for rotation about its axis, a single piece substantially uniformly arcuate leaf-type spring member anchored to the exterior of said ring and circumferentially

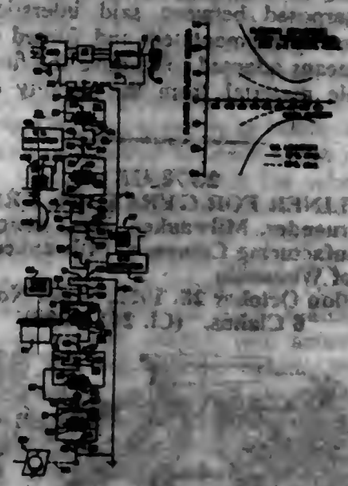
encompassing more than 180 degrees of the periphery of the ring, said circular spring member in its unflexed condition being disposed eccentrically with respect to said ring, and a spool having a circular opening in the core thereof removably received upon and supported solely by said spring member, the wall of said opening forcefully embracing the outer surface of said spring member and flexing said member inwardly to a position substantially concentric with said ring, the ring, spring member and spool thereby being rotatable as a unit substantially concentrically about said axis of said ring, the resilience of said spring member retaining said spool thereon.



2,770,426
FILTER CARTRIDGE
Eldred D. Steven, Winona, Minn., assignor to Unit Manufacturing Company, Winona, Minn., a partnership
Application May 28, 1952, Serial No. 290,397
3 Claims. (Cl. 242—123)

1. In a spool including a tube, an end wall therefor comprising a plurality of outwardly directed fingers fixed to an end of the tube and positioned substantially perpendicular to the axis of the tube, some of said fingers being disposed in a first radial plane and the remainder of said fingers being disposed in a second radial plane spaced axially outward of the tube from the first radial plane, a first disk received between said some and said remainder of said fingers, a second disk positioned against said remainder of said fingers, and staple means securing said disks and said fingers together, said staple means comprising a plurality of metal staples passing through said disks and said fingers, each of said staples passing through both a finger of said first radial plane and a finger of said second radial plane.

2,770,427
AIRCRAFT CONSTRUCTION
Robert E. Schmidt, Huntingdon, Pa.
Application July 15, 1953, Serial No. 299,260
6 Claims. (Cl. 244—3)

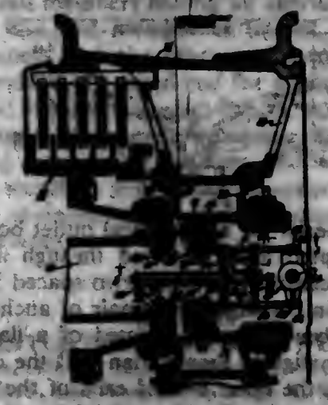


2. An aircraft comprising a buoyant, watertight, automotive type amphibious vehicle detachably mounted onto a buoyant, watertight, flight unit, said buoyant, watertight, flight unit being provided with engine controls and flight surface controls, said engine controls and said flight surface controls operable independent and apart from said buoyant, watertight, automotive type amphibious vehicle.

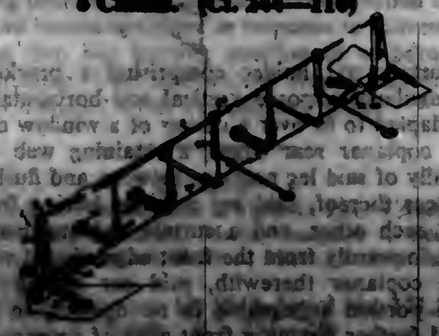
2,770,428
AUTOMATIC STEERING MECHANISM
Clarence E. Vogel, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application January 31, 1952, Serial No. 269,289
16 Claims. (Cl. 244—77)

13. In an automatic pilot for an aircraft, a gyroscope operated follow-up rebalanceable controller, a motor adapted to operate a control surface and operated by said controller, a pair of limit switches inverlably sequentially operated by said motor, circuit means including said switches for isolating said surface from the motor for limiting the operation of said surface by said motor independently of the rebalance of said controller; and means in said circuit means and operated in accordance with the airspeed of said aircraft for electrically shunting a first operable switch for rendering effective a subsequent operated switch.

2,770,429
AUTOMATIC CONTROL SYSTEMS
Oscar Hugo Schuck, Minneapolis, and Benjamin H. Clegel, Minneapolis, Minn., assignors to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application September 17, 1951, Serial No. 246,954
12 Claims. (Cl. 244—77)

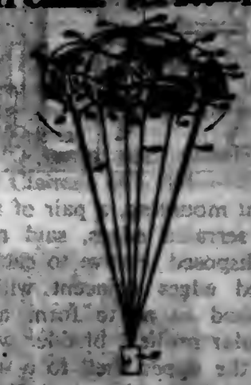


2. Control apparatus for an aircraft comprising: a servomotor adapted to control the attitude of said aircraft about an axis; attitude sensing means movable in accordance with tilt about an axis; movable attitude selector means; balanceable control means responsive to said attitude sensing and selector means for operating said servomotor in accordance with the relative extent of movement of said attitude sensing means and said selector means; and further means responsive to the longitudinal



change in position of the center of gravity of said aircraft and connected to said control means for changing the operation of said servomotor for any given difference in extents of movements of said attitude means and said movable attitude selector means.

2,770,430
AIRCRAFT UNDERCARRIAGE
Franklin C. Albright, South Bend, Ind., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application November 1, 1949, Serial No. 124,509
19 Claims. (Cl. 244—103)



1. In an aircraft undercarriage including a wheel rotatably mounted on a pivot block, a kingpin supporting said pivot block for pivotal movement and disposed diametrically with respect to and inside said wheel, a substantially horizontal stationary axle secured to said kingpin at right angles thereto and extending through said pivot block, one end of said axle terminating substantially flush with the corresponding lateral side of said wheel; shimmy damping means, including a hydraulic cylinder carried intermediate its ends by said outer axle end and means for holding the same for a predetermined axial movement but against radial movement with respect to said axle, a piston sealingly received in said cylinder and having a rod projecting from both sides thereof which extends diametrically across said pivot block, means operatively connecting the ends of said rods to said pivot block, said piston defining two variable volume liquid-containing chambers in said cylinder, and valve means operatively associated with said chambers whereby sudden movement of said piston from rest in one direction will be substantially unrestricted while movement in the opposite direction thereafter will be restricted.

2,770,431
AIRCRAFT BARRIER
John E. Snow, Hillsdale, N. J., assignor to Acme Precision Products, Inc., Bucyrus, Ohio, a corporation of Ohio
Application January 13, 1955, Serial No. 481,591
8 Claims. (Cl. 244—110)

1. An aircraft runway barrier comprising in pair of spaced supports, an arresting cable lying in the runway in a slack condition, an actuator cable extending between the supports above said arresting cable and releasably connected at each end thereof to the supports, a plurality of lifter straps depending from said actuator cable at spaced intervals and releasably connected to said arresting cable, energy absorbing means connected to said arresting cable at each end thereof respectively, and a pair of elongated flexible members each affixed at one end thereof at opposite sides of the runway and having the opposite end thereof releasably connected to said arresting cable adjacent one end of the latter, said members each contacting the runway at a point intermediate the ends thereof.

2,770,432
PARACHUTE WITH ROTATING CANOPY
Harry Thompson Stenhouse, Uplands, Ontario, Canada, assignor to The National Research Council, Ottawa, Ontario, Canada, a corporation of Canada
Application November 9, 1953, Serial No. 391,619
Claims priority, application Great Britain November 10, 1952
11 Claims. (Cl. 244—149)

1. A parachute for inanimate objects comprising a canopy, a plurality of shroud line units each connected at one end to the canopy, means for connecting the other end of each shroud line unit to a load, said means being adapted to transmit to the load such torque as is developed at the load end of the shroud lines and said canopy being formed of a plurality of gores each tapering from an outer end at the mouth of the canopy toward the top centre of the canopy, the gores being spaced from adjacent gores at the mouth of the canopy and substantially throughout their length to define correspondingly tapered slots between said gores, a junction member arranged centrally of the canopy to which the inner end of each gore is attached, at least one flexible relatively inextensible strap member spanning the gap between adjacent gores intermediate their ends and interconnecting adjacent edges of adjacent gores, and means adapted when the canopy is in flight to tilt said gores spaced from adjacent gores whereby in flight air trapped by the canopy passes tangentially through said slots and the canopy is rotated in a direction depending on the tilting of said gores.

2,770,433
PNEUMATIC MOUNTING SYSTEM
James A. McNally, United States Navy, Arlington, Va.
Application April 28, 1949, Serial No. 88,522
4 Claims. (Cl. 248—22)
(Granted under Title 35, U. S. Code (1952), sec. 266)

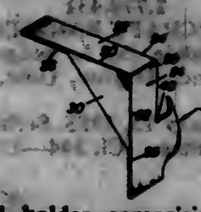
4. A resilient mounting comprising a pair of shells having juxtaposed complementary serrated edges and a

common axis, an impervious bladder within a cavity formed by said shells, valve means connected to said bladder having connection means passing through an upstanding side of one of said shells for connection to a source of fluid supply, means for supporting a machine from the upper of said shells, means for supporting the lower of said shells upon a supporting structure, and means exteriorly attached to one of said shells for coacting with the other of said shells thereby preventing axial displacement beyond a predetermined distance.

2,770,434
PNEUMATIC MOUNTING SYSTEM
James A. McNally, United States Navy, Arlington, Va.
Original application April 28, 1949, Serial No. 90,522. Divided and this application June 30, 1952, Serial No. 299,661
5 Claims. (Cl. 248—32)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a resilient mounting, a pair of rectangular shells having matched serrated edges, said rectangular shells being vertically disposed relative to each other and having said matched edges adjacent with the serrations thereon intermeshed so as to form a cavity therebetween, a rectangular resilient bladder within said cavity, means to attach the upper shell to a weight to be supported and to attach the lower shell to a supporting structure, means to permit inflation of said bladder for lifting the upper shell from the lower shell, first stop means on said upper shell, second stop means on said lower shell, retaining means attached to the stop means one one of said shells, and limiting means on said retaining means for engaging the other of said stop means for limiting separation of said shells to a predetermined value.

2,770,435
FASTENING DEVICE
Philip D. Becker, Hingham, Mass., assignor, by mesne assignments, to United-Carr Fastener Corporation, Boston, Mass., a corporation of Delaware
Application July 17, 1953, Serial No. 368,759
2 Claims. (Cl. 248—27)



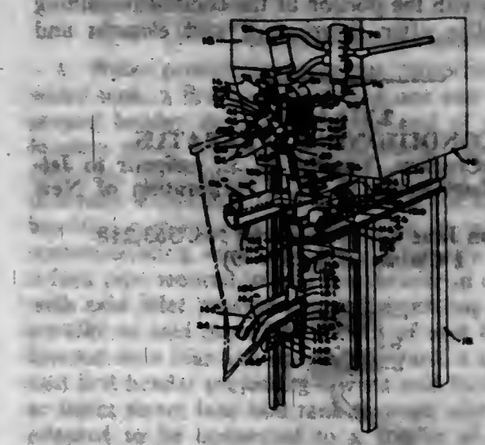
2. A fastening device for attaching a radio shield can to a support panel, comprising a substantially flat base having a central opening extending therethrough to receive the shield can, a pair of tongues extending downwardly from the inner edge of two opposing sides of the base, said tongues being inclined toward each other to enter suitable openings in opposite sides of the can, and a pair of attaching legs extending downwardly from the outer edges of two other opposing sides of the base, said legs being inclined inwardly toward each other and having bifurcated end portions, said bifurcated end portions having opposing shoulders disposed thereon, said base being transversely flexible between the legs whereby said legs may be moved toward the panel by flexing the base to enable the shoulders to snap into engagement in a suitable aperture in the panel, thereby maintaining the base in a bowed condition to hold the can tightly against the panel.

2,770,436
OUTLET BOX SUPPORT
Charles Linhardt, Jr., Baltimore, Md.; Mercantile Trust Company of Baltimore, executor of said Charles Linhardt, Jr., deceased, assignor to The Automatic Life Company, Baltimore, Md., a corporation of Maryland
Application December 6, 1950, Serial No. 199,435
1 Claim. (Cl. 248—57)

Supporting means for an electrical outlet box, said support being adapted to be inserted through a hole in a wall or ceiling centrally between two spaced joists thereof comprising, in combination, a pair of anchoring arms, each arm member being constructed of a flat rigid material and made slightly longer than half the distance between the joists, the outer end of each of the arms being twisted at right angles to the remaining portion of the arm having two or more pointed spurs on the outer twisted ends to engage the said joists, the opposite ends of the arms having apertures therethrough to receive a pivot pin, an L shaped bracket having an opening in the outer end of one of the legs thereof of substantially the same size as the aperture in the said anchoring arms, said leg being positioned between the apertured ends of the said anchoring arms, a pin frictionally connecting the two apertured ends of the anchoring arms with the leg of the bracket, the other leg of the bracket adapted to extend across the outer rear surface of the outlet box, a pair of apertures within said other leg for receiving bolts for securing the outlet box to the said second mentioned bracket leg, the length of the said first mentioned leg and the depth of the outlet box being substantially that of the distance from the outer surface of the ceiling to the point of contact of the anchoring arms with the joists.

2,770,437
CURTAIN ROD HOLDER
Erwin F. Pasch, Hancock, Mich.
Application June 4, 1953, Serial No. 359,473
1 Claim. (Cl. 248—262)

A curtain rod holder comprising a bracket having right angularly disposed vertical and horizontal leg portions adapted to fit over a corner of a window casing and having coplanar rear edges, a retaining web extending diagonally of said leg portions between and flush with the rear edges thereof, said leg portions having front edges free of each other, and a curtain rod engaging ear extending forwardly from the front edge of said vertical leg portion coplanar therewith, said ear having an upper pointed portion engageable in an opening in a curtain rod and further having a front edge of compound curvature adapted to fit in a curtain rod to hold the same in place on said pointed portion.

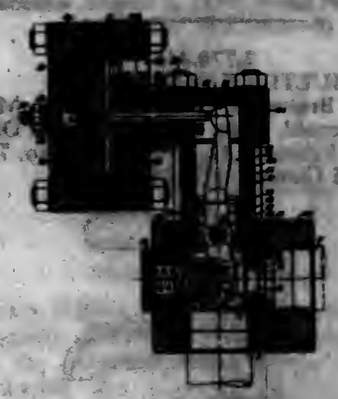


2,770,438
CONNECTOR STRUCTURE
Anthony E. Zingone, Massapequa, N. Y., assignor to New-Ray Products, Inc., New York, N. Y., a corporation of New York
Application June 24, 1953, Serial No. 363,743
4 Claims. (Cl. 248—317)

1. In a connector structure for connecting two members together, a link structure including end members and a plurality of links flexibly connected in chain formation, one of the end members having an aperture for pivotally connecting said end member to one of said first mentioned members and the other end member having an opening providing a hooked end for engagement with the other of said first mentioned members, said end members having reduced inner ends providing shoulders, and a coiled spring surrounding the links and the reduced ends of said end members and tensioned against the shoulders thereof for maintaining the link structure in tensioned elongated relation.

2,770,439
APPARATUS FOR FILLING POWDERED OR GRANULAR MATERIALS INTO BAGS
Neil S. Stafford, San Jose, and George A. Worley, Newark, Calif., assignors to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application September 17, 1954, Serial No. 456,768
6 Claims. (Cl. 249—66)

1. A discharge spout for fluidized solids comprising an initial conduit portion of resilient material and a terminal conduit portion of rigid material, said initial conduit portion having a section formed in the manner of a bellows and a smooth section, opposed members at either side of said smooth section normally held in a position sufficiently close to each other to deform said smooth section and block the flow of fluidized solids therethrough, a clamp movable into a position wherein it is effective to hold a bag in receiving position with regard to said terminal conduit portion, and means operative in response to movement of said clamp into bag holding position to withdraw said opposed members from said smooth section and thus permit flow of fluidized solids through said spout.

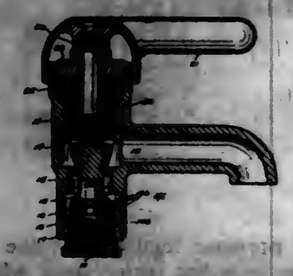


2,770,440
PILOT-CONTROLLED HYDRAULIC VALVE
John E. Woods, Cohasset, Mass., assignor to Standard-Thomson Corporation, Boston, Mass., a corporation of Delaware
Application February 12, 1952, Serial No. 271,219
5 Claims. (Cl. 251—28)

1. A hydraulic valve comprising a frame having a main valve seat, a main valve member having a base portion, a flexible seal secured between said base portion and the frame to accommodate axial movements of the main valve member, a pilot valve coaxial with the main valve, and having a stem passing through the main valve, a closure member for the frame having a seat for

the pilot valve, a spring tending to close the pilot valve, and a spring surrounding the stem and tending to close the main valve, the main valve member having a leakage opening to relieve the pressure in the rear of said base when the pilot valve closes.

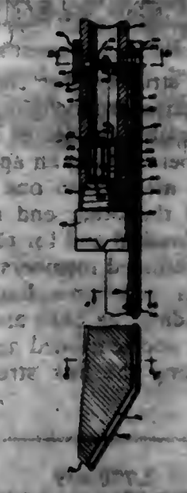
2,770,441
FLUID PRESSURE REGULATOR
Marvin Henry Grove, Piedmont, Calif., assignor to Grove Valve and Regulator Company, Oakland, Calif., a corporation of California
Application October 1, 1951, Serial No. 249,201
2 Claims. (Cl. 251—63)



1. In a fluid pressure regulator of the type including a movable valve member cooperating with a valve seat for controlling flow of fluid and a fluid pressure operated member for operating the valve member, together with a body having one part serving to mount the valve seat and enclose the valve member and a second part detachably secured to the first part; means forming an operative connection between the fluid pressure operated member and the valve member comprising a lever disposed within the body, one end of the lever being disposed within the first part of the body and operatively connected to the valve member and the other end of the lever extending within the second part of the body and operatively connected to said fluid pressure operated member, a rigid sleeve, a pivot pin carried by diametrically opposite portions of said sleeve and providing a pivotal mounting for said lever, said first and second body parts having aligned bores formed therein for accommodating said sleeve, the ends of the pin terminating within the body and within one of said bores, and sealing means surrounding said sleeve and forming a seal between said first and second body parts, said sleeve having a portion of enlarged diameter at one end, a shoulder formed in the bore in said second body part, said enlarged portion fitting between said shoulder and said first body part to lock said sleeve against movement in a longitudinal direction relative to the body parts.

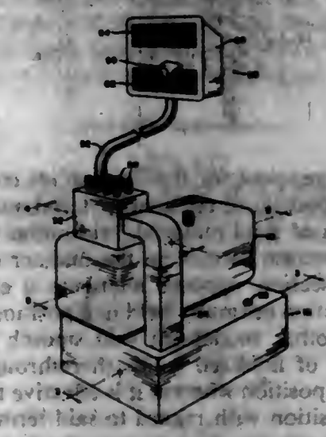
2,770,442
**CONTROL APPARATUS**
Peter P. Denny, Chicago, Ill., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application February 16, 1953, Serial No. 337,025
6 Claims. (Cl. 251—61)

3. In an actuator adapted to be attached to a valve stem, a motor chamber having a movable wall, a rigid reinforcing member abutting said movable wall, a spring retaining member having means spacing said latter member from said wall and having diametrically extending slots therein, a latch member slidable along said spring retainer member and having portions movable along said slots and having an aperture adapted to retain a valve stem, and spring means arranged to hold said spring retaining member, said latch member and the reinforcing member in assembled relation.



2,770,443
**MULTIPLE SEAL VALVE**
Henry J. Rand, Brunswick, Ohio, assignor to Magic Seal, Inc., Brunswick, Ohio, a corporation of Ohio
Application February 12, 1949, Serial No. 76,072
5 Claims. (Cl. 251—333)

1. A valve comprising a housing having a fluid inlet and a fluid outlet and an inner connecting passage therebetween, a compressible resilient plug part at the upstream end of said passage, coaxial therewith and axially movable relative thereto, said plug part being insertable in the upstream part of said passage, one of said parts being cylindrical and the other of said parts being frustoconical, one of said parts having a plurality of uninterrupted parallel peripheral ribs lying in planes at right angles to the axis of said plug, and one only of said ribs adapted to make an initial line contact with the other of said parts to immediately seal said passage against the flow of liquid therethrough.



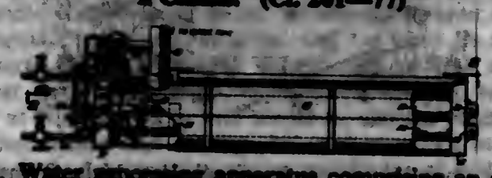
2,770,444
**CIRCULATING AND ROTATING RETRIEVABLE WHIPSTOCK**
Stephen A. Neal, Odessa, Tex.
Application March 16, 1953, Serial No. 341,423
2 Claims. (Cl. 255—1.6)

1. In a drilling apparatus including a drill collar formed with a passage for a fluid drilling substance, a whipstock arranged longitudinally exteriorly of said drill collar and having a pipe extending longitudinally therealong, a shearable conduit extending between and connecting said whipstock and said drill collar for rotation together as a unit, said conduit connecting said drill collar passage to said whipstock pipe and being shearable upon longitudinal movement of the drill collar relative to the whipstock, valve means positioned within said drill collar passage and normally spaced from said conduit and operatively connected to said drill collar, a frangible element positioned

within and extending laterally through said conduit so as to be sheared therewith and engaging said valve means to hold said valve means in the normally spaced position with said conduit, and means operatively connected to said valve means for moving said valve means into closing position with the portion of the conduit remaining in the drill collar after shearing of said element and said conduit.

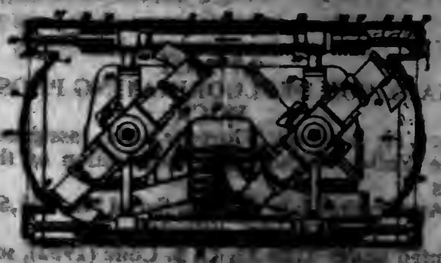
2,770,445
**AIR CONDITIONING APPARATUS**
Calvin D. MacCracken, Tenafly, N. J., assignor to Jet-Heet, Inc., Englewood, N. J., a corporation of New York
Application June 22, 1953, Serial No. 363,210
1 Claim. (Cl. 257—9)

In a diffuser for a forced air domestic heating and cooling system of the type comprising separate hot and cold air delivery units and distributing means for conducting either warm or cold air from said units to a plurality of diffusers, in combination, a casing having air inlet and outlet openings, a nozzle in said casing having a neck portion, a collar forming a channel around said neck portion of said nozzle within which to collect condensate forming on said nozzle, and said nozzle neck having a hole therein adjacent said collar and opening into said channel for diverting into said channel a small portion of the air delivered to said nozzle whereby to evaporate condensate collecting in said channel.



2,770,446
**GAS AND LIQUID MIXING DEVICE**
Ellis P. Agbabian, New York, N. Y.
Application February 18, 1953, Serial No. 337,806
10 Claims. (Cl. 261—76)

1. A device for mixing a gas and a liquid comprising a conduit for the liquid, an inverted cup perforated at its top and having an internal lip at its open end, screen means in the cup and bearing against said lip, and tabs extending inward from the inner side wall of the cup and limiting the upward motion of the screen means, said cup being located in said conduit, said cup having an air inlet into the same and said conduit having an air inlet feeding air to the air inlet of said cup.

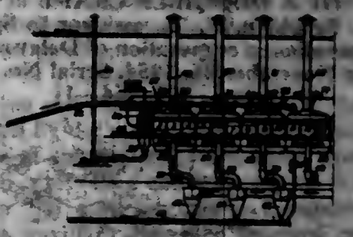


2,770,447
**WATER PROCESSING APPARATUS**
Henry C. Kraus, Long Beach, Calif., assignor to Railway Steam Research Corporation, Monterey Park, Calif., a corporation of California
Application November 27, 1953, Serial No. 394,783
2 Claims. (Cl. 261—77)

1. Water processing apparatus comprising an elongate water tank, a first header closing one end of said tank, a second header closing the other end of said tank, said headers being formed of solid metal blocks secured to the ends of said tank, a pair of tubes disposed longitudinally within said tank and secured at each end to said headers, a water inlet passageway in said first header communicating with said tank externally of said tubes, a feed pipe secured to said first header in communication with said inlet passageway and extending into said tank parallel to said tubes, the mouth of said feed pipe being formed on a bias and opening upward, a steam nozzle in said first header projecting toward said feed pipe, effective to inject steam into said tank through said feed pipe and adapted to be connected to a source of steam, one of said tubes having an opening therein adjacent said first header for entry of water from said tank into said one tube, said second header having a passageway communicating between said pair of tubes for passage of water from said one tube to the other tube, a circulation passageway in said first header communicating between said inlet passageway and the end of said other tube to permit recirculation of water through said tubes by virtue of injected steam, outlet conduit means communicating with said other tube through the top thereof and adjacent said first header, adapted to convey water away from the apparatus, and vent conduit means communicating with said tank at the top thereof generally above the mouth of said feed pipe and extending upward from said tank.

**EXTENSIBLE ROTARY CUTTER BAR FOR BORING TYPE MINER**
Frederick B. Mining Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application February 14, 1953, Serial No. 487,981
6 Claims. (Cl. 262—7)

1. In a mining machine having a boring arm for cutting a bore, the improvement comprising, an elongated rotary cutter means supported by the machine substantially tangentially to the cutting limit of the boring arm, said cutter means including an inner portion and an outer portion, means providing longitudinal relative movement between said portions, drive means for rotating said cutter means including connection means between the inner



and outer portions thereof, said connection means including a slot in one of said portions and a bit disposed on the other portion in alignment with said slot, said bit being so positioned in relation to said slot to provide a positive drive means between the inner and outer portions of the cutter means.

2,770,449
**BORING AND BREAKER HEAD FOR SLACK COAL**
Vincent J. McCarthy, Youngstown, Ohio, assignor to The Salem Tool Company, Salem, Ohio, a corporation of Ohio
Application August 2, 1955, Serial No. 525,842
14 Claims. (Cl. 262—9)

1. A rotary drilling head comprising an axial portion, spaced radially disposed vanes extending outwardly therefrom, the peripheral edges of the vanes being inclined forwardly and inwardly, radially disposed arms extending outwardly from said axial portion between the vanes, cutting bits upon said arms, and an axially disposed cutting tool at the forward end of said head.

2,770,450
**METHOD AND APPARATUS FOR BURNING CEMENT**
Eigen Seleger, London, England, assignor to Associated Limestone Corporation Limited, London, England
Application June 4, 1953, Serial No. 359,479
Claims priority, application Great Britain June 16, 1952
13 Claims. (Cl. 263—32)

1. A method of burning cement in which a granulated mixture of raw cement material and solid fuel is formed into beds on grates in a number of independent containers in which the burning cycles are staggered, the air flows upwards through each bed, and the containers are continuously or intermittently fed with additional

mixtures of raw material and fuel as the burning proceeds, so that the depth of the bed increases as the burning proceeds from the bottom upwards and the combustion zone during the greater part of the burning is always covered by a thin layer of fresh raw material and fuel, the burnt beds of clinker being successively discharged so that cement is produced substantially continuously.

---

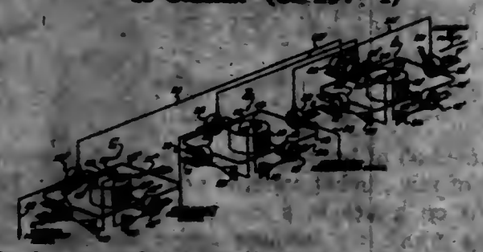
2,770,451

## FURNACE FOR DEFLUORINATING PHOSPHATE ROCK

Lawrence H. Almond, Florence, Ala., assignor to Tennessee Valley Authority, a corporation of the United States

Application July 6, 1954, Serial No. 441,689
2 Claims. (Cl. 263—29)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a furnace for the production of molten defluorinated phosphate rock having a hearth section surmounted by a shaft section, means for charging phosphate rock located at the top of the shaft section, at least one fluid fuel burner in the hearth section and a taphole at the bottom of the hearth section, that improvement which comprises a substantially round vertical-walled hearth section constructed of a single layer of graphite blocks; a vertical-walled shaft section surmounting said hearth section and having an internal diameter substantially the same as that of the hearth section; supporting members independent of the hearth section, disposed to bear substantially the entire weight of the shaft section; means for exerting uniform pressure upon a small part of each graphite block of the hearth section toward the vertical axis of the furnace disposed around said hearth section; and means for flowing a film of cooling liquid of substantial thickness over substantially the entire external surface of the hearth section in direct contact with the graphite blocks.



---

2,770,452

## SYSTEM FOR MEASURING THE ACCELERATION OF A DIRIGIBLE CRAFT

Harry Miller, Brooklyn, N. Y., assignor to Sperry Rand Corporation, a corporation of Delaware

Application November 26, 1954, Serial No. 471,174
13 Claims. (Cl. 264—1)

13. A system for measuring horizontal and vertical accelerations along the responsive fore and aft, athwartship and vertical axes of a dirigible craft comprising a short period vertical reference having gravity sensitive devices responsive to athwartship and fore and aft accelerations of the craft, respectively, a normal period vertical reference having gravity sensitive devices for detecting tilt about the fore and aft axis and athwartship axis of the craft, a second short period vertical reference having a gravity sensitive device responsive to vertical acceleration of the craft, means for providing a signal proportional to the fore and aft acceleration of the craft operated by said first short period vertical reference and said normal period vertical reference, means for providing a signal proportional to the athwartship acceleration of the craft operated by said first short period vertical reference and said normal period vertical reference, and means for providing a signal proportional to the vertical acceleration of the craft operated by said first short period vertical reference and said second short period vertical reference.

2,770,453

## AUTOMOTIVE VEHICLE STABILIZING MEANS

Herman C. Cable, Birmingham, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware

Application September 9, 1952, Serial No. 309,023
9 Claims. (Cl. 267—21)

1. In combination, a longitudinal vehicle frame, an individual wheel suspension at each side of the frame and each including a lateral arm connected to the frame for swinging movement about an axis lying substantially longitudinally with respect to the frame, the axis of oscillation of one lateral arm being disposed in a horizontal plane containing the axis of oscillation of the other said lateral arm, and oscillant bar means extending transversely of the frame adjacent said lateral arms, said bar means having a substantially straight central section and opposite end portions extending generally diagonally with respect to said central section, the junction between each of said generally diagonal end portions and said central section of the bar means being located substantially at the intersection of said central section with a vertical plane containing the axis of oscillation of the adjacent lateral arm, there being a first means of yieldable material mounted on the frame at each side thereof connecting the portion of the central section of said bar means adjacent its respective junction point at that side to said frame at a location in close juxtaposition to the axis of oscillation of the lateral arm at that side, there being a second means of yieldable material at each side of the frame connecting the end portion of the bar means at that side to the lateral arm at that side adjacent the axis of oscillation of the latter.

## DRIVE CONTROL AND TRANSMISSION MECHANISM

Rupert Clifford Turtle, East Cowton, England, assignor to Airmec Controls, Limited, East Cowton, England, a British company

Application October 30, 1954, Serial No. 464,817
Claims priority, application Great Britain November 2, 1953
8 Claims. (Cl. 268—31)

1. A mechanism for effecting movement of one member relative to another member comprising a carriage secured to the first of said members, said carriage being

pivotally mounted about a pivot axis and having a roller rotatably mounted therein for rotation about an axis coincident with said carriage pivot axis, a bar slidably mounted within said carriage and adapted for longitudinal reciprocatory movement therein, one end of said bar being pivotally secured to the second of said members, cable means for adjusting the angular position of said members relative to each other, said cable means including a first cable secured to one end of said bar and a second cable secured to the other end of said bar, said cables passing in opposite directions around said roller, control means for applying tension to either cable at will,

said pivot connection of said bar to said second member being so disposed that in the closed position of said members said connection is coaxial with respect to said carriage pivot axis, whereby in the closed position of said members and pursuant to an increase in tension on the appropriate cable said carriage and bar may be moved angularly about the pivotal axis from a position nesting against said members to a position extending substantially at right angles to said members and the position of said bar within said carriage being then varied to effect to any desired extent the angular positioning of said members with respect to each other.

---

2,770,455

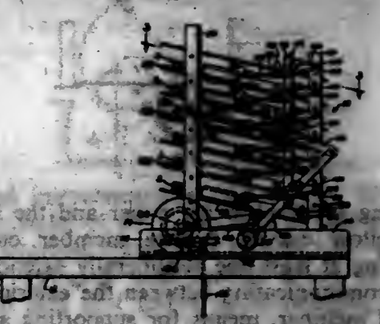
## AUTOMATIC CONTROL FOR GARAGE DOORS

Aubrey D. Brister, Orange, Tex.

Application May 31, 1955, Serial No. 512,167
4 Claims. (Cl. 268—59)

1. In combination with an overhead garage door movable in tracks and cooperating with a door frame to form a closure, an automatic control comprising a reversible motor driving a pair of drums, first cable means entrained about one of said pair of drums and connected to said door for raising said door, second cable means entrained about the other of said pair of drums and entrained about a pulley on said door frame and secured to said door for lowering said door, and switch means for actuating said motor, latch means for holding said door closed, said first cable means being secured to and actuating said latch means.

---



2,770,456

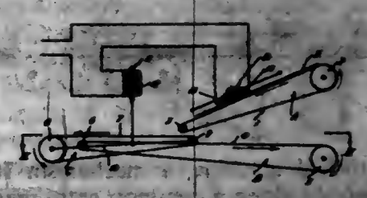
## COLLATOR

Joseph Maguirase and Floyd C. Hoffman, Chicago, Ill., assignors to Courier-Citizen Company, Chicago, Ill., a corporation of Massachusetts

Application February 24, 1952, Serial No. 271,578
8 Claims. (Cl. 270—58)

1. In a collating machine of the character described, a stationary framework including a plurality of superposed trays providing a series of bins therebetween each adapted to receive therein a stack of paper sheets, the trays being inclined and with their forward edge uppermost a reciprocable carriage mounted on said framework for movement in a fore and aft direction at an inclination parallel to the trays, pusher arms pivoted to the carriage and each overlying a tray, each arm being movable from a lowered operative position wherein it engages the uppermost sheet of a stack to an elevated inoperative position wherein it clears said stack, means operable when said

carriage approaches its foremost position for moving said arms to their elevated positions, means operable when said carriage approaches its rearmost position for causing said elements to be lowered into stack-engaging positions, means for selectively disabling the last named means of any selected ones of the pusher arms whereby the selected ones of the pusher arms are maintained in their inoperative positions, and means for reciprocating said carriage, whereby forward movement of each lowered arm causes it to move the top sheet of its stack forwardly in an upwardly inclined path.



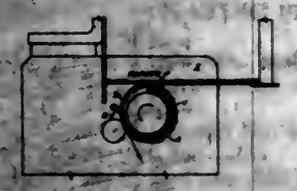
---

2,770,457

## MACHINE FOR FOLDING BEDSHEETS AND OTHER ARTICLES IN SOFT AND PLIABLE SHEET FORM

Henri Leon Lucien Mons, Boulogne-Billancourt, France

Application February 1, 1955, Serial No. 485,505
7 Claims. (Cl. 270—68)



1. Machine for folding soft and pliable materials in sheet form, of the category of bed sheets, comprising: a stationary feed conveyor with a delivery end; a delivery conveyor with several aprons passing over end rollers and of which the upper plies pass under the delivery end of the stationary feed conveyor; an auxiliary conveyor with several aprons passing over end rollers and imbricated in those of the delivery conveyor, and of which the upper plies move in the opposite direction to that of the upper plies of the delivery conveyor, one at least of the delivery conveyor and auxiliary conveyor being mobile in relation to the other in a direction such that the plane defined by its upper plies can pass from one side or the other of the plane defined by the upper plies of the other conveyor so that a sheet of soft and pliable material coming from the delivery end of the feed conveyor can be displaced in one direction or the other according to whether the upper plies of the auxiliary conveyor or those of the delivery conveyor are nearest to the delivery end of the feed conveyor; control means operatively connected to that one of the two conveyors which is mobile in relation to the other, to control the movements of the said conveyor; and at least one detector means sensitive to the passage of

each soft and pliable sheet of material over the feed conveyor and connected to the control means so as to actuate them.

---

2,770,458
PAPER FEEDER
John Hutchins, Brookville, Theodore F. Arenson, Valley Stream, and Floyd A. Lyon, Brookville, N. Y.
Application August 14, 1953, Serial No. 374,304
3 Claims. (Cl. 271—39)

1. A feeding mechanism for paper and the like comprising a hollow curved surface member oscillatably mounted having at least one peripherally extending aperture therein communicating between the exterior and interior of said member, means for supporting a stack of papers to rest operatively upon said member with the closest paper adjacent and tangent one end of said aperture, means for placing the interior of said cylinder under a partial continuous vacuum between papers, and means for oscillating said member and moving said closest paper when overlapping the slotted portion of said cylinder separated in part from the rest of the stack and means for removing said paper from the stack such that the line of travel of said paper is along said surface.

---

2,770,459
STOPPING DEVICE FOR CARD FEEDING MACHINES
Lawrence A. Wilson, Apalachin, Bernard V. Kamp, Binghamton, and George A. Lindsay, Endicott, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application September 2, 1953, Serial No. 378,112
7 Claims. (Cl. 271—57)

5. In a statistical machine, a mechanism for feeding records successively along a common path, means having a movable operating arm for controlling the operation of the feeding mechanism, a ribbon extending along said path and connected at one end to said arm and fixedly mounted at the other end, and a guide member against which said ribbon rests between the ends thereof, distortion of a record from said path on either side of said guide member pushing transversely on said ribbon to effect a tensioning of said ribbon and cause a pull thereon, whereby said arm and controlling means are operated to stop the feeding mechanism.

---

2,770,460
MISSILE AND TARGET DEVICE THEREFOR
John F. Deasy, Shawnee, Kans.
Application August 14, 1953, Serial No. 374,223
2 Claims. (Cl. 273—102)

1. In game apparatus of the character described, the combination of a target member having a sheet of material with a suitable target marked on the forward face thereof, a mesh member overlying the target area and spaced forwardly from said sheet of material, said mesh having a plurality of substantially uniform equally spaced parallel wires extending across the target area in one direction and a plurality of substantially equally spaced parallel wires extending across the target area at right angles to the first named wires and forming substantially square openings therebetween, said wires being secured together at their crossing points, means securing the mesh and sheet together to maintain the spacing therebetween in the target area, and a missile having an elongated body for projection toward the target, said missile having a relatively slender resilient compressible portion at the forward portion thereof, the resilient compressible portion tapering from the forward end of the missile to

a transverse dimension that is larger than the transverse dimensions of the openings in the mesh whereby when the missile is projected toward the target and the forward end of the missile enters an opening in the mesh the portions of the mesh defining the opening engages and compresses the compressible material of the missile preventing displacement of the missile, the spacing between the mesh and target sheet being slightly greater than the portion of the missile projecting through the opening in the mesh whereby the mesh stops and holds the missile with the point of the missile close to yet spaced from the target.

---

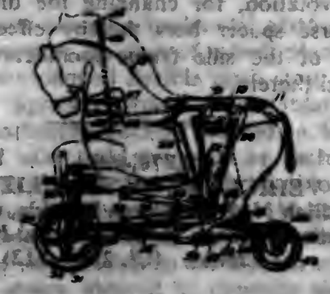
2,770,461
CHUCK
Martin H. Rodmer, Chicago, Ill.
Application February 21, 1956, Serial No. 566,887
5 Claims. (Cl. 279—55)

1. A chuck comprising a shank plate, a hub plate, means for bolting said hub plate to said shank plate, a hub seated in said hub plate, a split tool bushing in said hub, said hub having a removable segment and a spring band urging said removable segment away from said bushing, a yoke member for clamping about said hub to hold said removable segment in position against said bushing, and means carried by said yoke for applying clamping pressure by said hub and its removable segment against said bushing.

---

2,770,462
LOOSE JAW CHUCK
John Jordan Roberts, Riverside, Idaho
Application June 1, 1954, Serial No. 433,422
5 Claims. (Cl. 279—56)

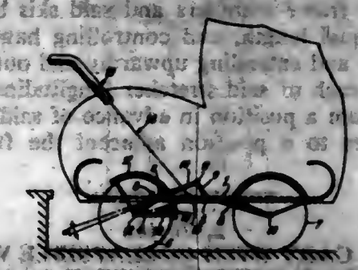
1. A chuck comprising an outer casing, an inner cylinder, an intermediate cylinder rotatably positioned between the outer casing and the inner cylinder, a segmental pressure ring positioned around the inner cylinder, said inner cylinder having a plurality of slots with inclined end walls forming cam surfaces, a plurality of tool gripping jaws radially movably mounted in said slots, said jaws having inclined outer ends with cam surfaces for engaging the cam surfaces in the end walls of said slots in said segmental pressure ring, said pressure ring being exteriorly threaded and said intermediate cylinder being interiorly threaded wherein said cam surfaces will move relative



to each other upon rotation of the intermediate cylinder thereby moving said jaws radially in the slots for selectively gripping a tool.

---

2,770,463
TOY HOBBY HORSE
Eugene P. Battaglia and Joe Miller, Bronx, N. Y.
Application August 25, 1955, Serial No. 530,575
9 Claims. (Cl. 258—1.195)



1. In a rider-propelled toy vehicle, a fixed frame, a movable frame having a pivot intermediate the ends thereof securing the movable frame to the fixed frame, the movable frame comprising a pair of panels in parallel spaced relation to each other and in the shape of a ridable animal, a seat secured to the movable frame and movable as a unit therewith, means for rocking the movable frame comprising a pair of substantially horizontal foot levers pivoted at the rear ends thereof to and respectively on opposite side of the fixed frame and operable by the rider alternately downwardly to oscillate respectively in opposite directions simultaneously, the front end of each lever being free, a connecting rod from an intermediate point on one lever to a point on one of the panels in horizontal spaced relation to and on one side of the pivot, and a connecting rod from an intermediate point on the other lever to a different point on the other panel on the other side of the pivot and in horizontal spaced relation thereto, a front wheel unit comprising a crank shaft, means securing the shaft to the fixed frame, a connecting member between the shaft and the movable frame rotating the shaft when the movable frame is rocked by the levers, a rear wheel unit, a pivot mounting said unit to the fixed frame, and means for swinging said unit to steer the vehicle.

---

2,770,464
UNDERCARRIAGE FOR VEHICLES DESIGNED TO RUN OVER UNEVEN GROUND AND, IN PARTICULAR, UP AND DOWN STAIRS
Michael Mitterdrein and Herwig Göbel, Vienna, Austria, assignors to AVE Transportmittel Holding A. G., St. Moritz, Switzerland
Application March 19, 1953, Serial No. 343,424
Claims priority, application Switzerland March 19, 1952
3 Claims. (Cl. 280—5.28)

1. An undercarriage for a baby carriage or the like comprising a frame, two first wheels, two second wheels, two first levers individually and coaxially swingably connected with said frame, each of said first levers having a free end supporting one of said first wheels, two second levers individually and coaxially swingably connected with said frame, each of said second levers having a free end supporting one of said second wheels, a first torsion rod interconnecting said first levers and extending coaxially of the swing axes of said first levers, a second

torsion rod interconnecting said second levers and extending coaxially of the swing axes of said second levers, a linkage interconnecting said torsion rods and including means for swinging said second levers in a direction opposite to said first levers upon swinging of said first levers.

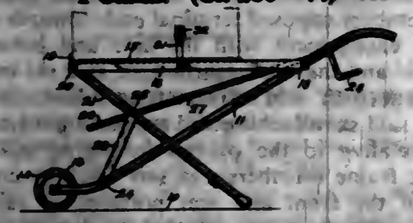
---

2,770,465
RESCUE SLED
Raoul Dandurand, Montreal, Quebec, Canada
Application March 16, 1953, Serial No. 342,406
5 Claims. (Cl. 280—12)

1. A rescue sled comprising in combination with a stretcher body having elongated rigid longitudinal side frame members terminating at each end in carrying handles, at least one rigid transverse frame member secured between said longitudinal members, and a flexible body supporting portion mounted on and extending between said side frame members to terminate at each end short of said handle portions; ski attaching and supporting members secured to and extending directly downwards from said longitudinal side frame members in spaced apart pairs, each of said members having a pair of opposed ski-spanning lower terminal end portions bent inwardly in opposed relationship to constitute ski clamping members adapted to engage the side and lower surface of a ski at each side, an adjustable ski-spanning retaining member extending between each opposed pair of said ski clamping members in spaced apart relationship with and above said terminal ends, a pair of skis mounted on said ski supporting members in spaced apart alignment and beneath said longitudinal side frame members with the body of each ski disposed between said adjustable retaining members and said clamp members terminal ends whereby adjustment of each of said adjustable members in one direction is adapted to urge the corresponding clamp members opposed terminal ends towards each other and into engagement with the side and lower surfaces of said ski and the upper surface of said ski into bearing engagement with said ski-spanning adjustable retaining member, said ski attaching and supporting members being located relative to the overall length of said stretcher body side frame members and skis whereby considerable lengths of the front and rear portions of said skis are free and unattached and adapted to flex in the manner of a free ski, a pair of flexible transverse shock absorber members of arcuate shape mounted beneath said stretcher body in spaced apart relationship with the terminal ends of each member connected at each side to said ski supporting members adjacent said connection with said skis,

flexible longitudinal bracing members extending between said longitudinal side frame members and said ski supporting members and being connected thereto at spaced apart points leaving the front and rear portions of said skis free for shock absorbing flexure and constituting a flexible reinforcing truss structure, said stretcher longitudinal side frame members and said skis being of substantially equal length, and controlling handle members mounted on and extending upwardly and outwardly from one end of each of said stretcher longitudinal side frame members from a position in advance of said ski supporting members to a position adjacent the front ends of said skis.

---



2,770,466
**GOLF CART WITH COLLAPSIBLE WHEEL STRUCTURE**
Anthony P. Pearson and Robert L. Pigott, Seattle, Wash.
Application March 28, 1955, Serial No. 497,072
9 Claims. (Cl. 280—41)

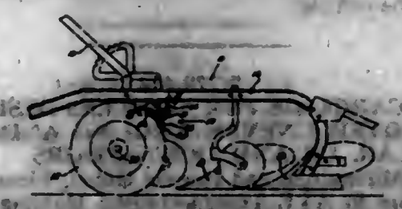
1. A cart of the character described comprising a frame structure including an elongated, central bar, a cross-head fixed to the bar between its ends, a pair of legs with their inner ends pivoted on the opposite end portions of the cross-head, respectively, for swinging adjustment from positions extended closely along opposite sides of said central bar to a plurality of definite positions outwardly directed therefrom, a wheel mounted at the outer end of each of said legs, for the wheeled support of the cart at any of the various positions of adjustment of said legs; said cross-head being provided at its opposite ends with edge surfaces along which portions of the legs that are adjacent their pivotal mountings, are adapted to swing in moving from one position of adjustment to another, said edge surfaces being provided with notches, at spaced intervals therealong, a boot slidably fitted to each leg, a tooth projecting from the inner end of each boot adapted to be received in any one of said notches of the corresponding edge surface to retain the leg to which the boot is fitted at a definite position of adjustment.

---

2,770,467
**VERTICALLY ADJUSTABLE TABLE**
John Earl Mowry, Denver, Colo.
Application June 6, 1955, Serial No. 513,542
1 Claim. (Cl. 280—44)

A frame for supporting and vertically adjusting a table, comprising in combination, two table top supporting side frame members, means for holding said members in spaced parallel relation, a first pair of table legs pivotally connected with one end of the side frame assembly, a second pair of legs pivotally connected with the side frame assembly at the other end thereof, said second pair projecting upwardly beyond its pivotal connection forming handles, the legs of the first and second pairs of legs crossing beneath the table, the lower ends of said pairs of legs constituting supports means comprising upper and lower transverse bars for holding the legs of the second pair in a predetermined spaced relation, a link pivotally connected to each leg of said second pair at a point adjacent its lower end, the upper ends of the links being pivoted to the corresponding legs of the first pair at points spaced from their pivotal connections with the side frame members a distance substantially equal to the distance between the pivot points of said links, a spacer bar positioned between the legs of the first pair adjacent the point of link pivotation, the upper spacer bar connecting the second pair of legs being positioned adjacent the pivotal connections of the legs with the side frame members, and means comprising a crank shaft journaled in a bearing in the last mentioned transverse bar and having a threaded connection with the transverse bar spacing the first pair of legs adjacent the link pivotation, for changing the distance between the transverse spacer bars thereby effecting a vertical adjustment of the side frame members and the table top attached thereto.

---



2,770,468
**VEHICLE SWAY STABILIZER**
Elijah N. Williamson, Bayside, Calif.
Application January 28, 1954, Serial No. 405,992
2 Claims. (Cl. 280—112)

1. A sway stabilizer comprising a load-carrying axle, a pair of braces hinged one to the other and having their opposite ends hinged at points adjacent the extremities of the axle, independent spring means extending between said axle and each of said braces, and pivotal connections connecting the opposite sides of the load to one of the respective adjacent braces.

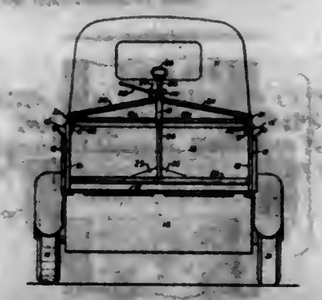
---

2,770,469
**AGRICULTURAL IMPLEMENT WHEEL SCRAPER ASSEMBLY**
Edward C. Sedo, Traer, Iowa
Application February 8, 1955, Serial No. 486,782
3 Claims. (Cl. 280—158)

1. For use on an agricultural implement having a ground wheel, a wheel scraper assembly comprising a scraper disc having a supporting shaft extended only from one side thereof, a bearing for said shaft, and means for mounting said bearing on said implement at a fixed position providing for the location of said disc in a position in which the opposite side thereof is adjacent to and

at an angle relative to the periphery of said wheel, with said shaft being positioned inwardly of the transverse center of the ground engaging surface of said wheel to provide for rotation of said disc on contact therewith of mud and dirt adhering to said wheel.

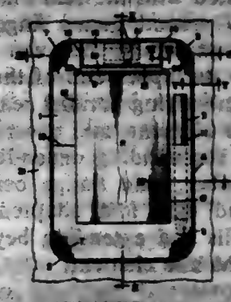
---



2,770,470
**BOAT TRAILER AND ANCHORING STRAP THEREFOR**
Milton A. Halvorsen, Brainerd, Minn., assignor to Design-Rite Company, Brainerd, Minn., a corporation of Minnesota
Application February 8, 1954, Serial No. 408,728
1 Claim. (Cl. 280—179)

In a boat trailer having a horizontal platform adapted to receive and support the keel of a boat placed thereon, a friction buckle-equipped flexible girth strap adapted to encompass and tightly embrace a boat intermediate its ends, friction anchoring buckles secured to the intermediate portion of said girth strap one on each side of its longitudinal center and adapted to be positioned on opposite sides of said boat below the gunwales thereof when said first-mentioned buckle is between said gunwales and in overlying relationship to the bottom of said boat, and anchoring straps secured to opposite sides of said trailer intermediate its front and rear ends, the upper end portions of said anchoring straps having cooperative engagement one each with one of said anchoring buckles, said girth strap being provided with a generally U-shaped metallic link adapted to be interposed between the platform of said trailer and the keel of said boat and to receive said keel therein.

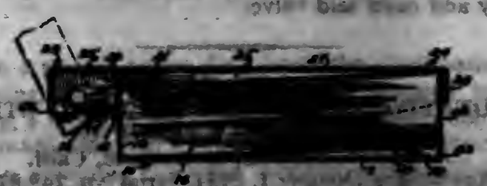
---



2,770,471
**HOLD-DOWN BAR**
Harry E. Scott, Englewood, Colo.
Application April 11, 1955, Serial No. 500,558
7 Claims. (Cl. 280—179)

1. A hold-down bar for conventional truck beds comprising complementary channel members fixed at the opposite sides of the bed to extend above and perpendicular to the bed floor with their channels directed inwardly in opposition transversely of the bed, a rigid headframe detachably secured to upper ends of said members and bridging transversely of the bed therebetween, a bar spanning between and slidably engaged at its ends with said members, a stem fixed centrally of and perpendicular to said bar in slidable association with said headframe, and latch means on the latter frictionally engaged with said stem to releasably limit upward shift of the stem relative to the headframe.

---



2,770,472
**MAGNETIC MEMO HOLDERS**
Orea E. Whitwell, Denver, Colo.
Application July 9, 1954, Serial No. 442,358
2 Claims. (Cl. 281—15)

1. A holder for magnetic attachment to a metal surface and adapted to hold a relatively stiff article such as a pad, which comprises a face panel and a back panel of flexible plastic material, said face and back panels being sealingly joined completely around their marginal edges to present a forwardly extending continuous bead around the margin and which bead is of a thickness greater than the thickness of either of the panels so as to provide a rigidifying marginal frame therefor, and there being a groove-like depression in the face panel immediately adjacent to and inboard of said bead and extending continuously around the margin of the face panel to provide an area in the face panel of less cross sectional thickness than the remainder of the panel whereby that portion of the panel lying inwardly from the bead and from the groove is gathered and puckered to stand away from the adjacent surface of the back panel, said face panel having a narrow elongate opening therein substantially parallel to one edge thereof to receive a relatively stiff article such as the backing of a pad, and there being a second groove-like seal intermediate said opening and said one side of the panel with which the opening is parallel, said second seal defining, with a marginal portion of the first mentioned seal, a rectangular area wherein the first seal forms one side and the second seal forms the other three sides, and said second seal forming a groove in the face panel and flattening the same throughout so as to further pucker and spring away the material of the face panel within the confines of the second groove to form a magnet pocket and leaving the back panel substantially flat, and an elongate magnet positioned within said pocket, said magnet having beveled opposite side edges extending parallel to said marginal portion of the first mentioned groove forming one boundary of the pocket and said beveled edges being disposed in opposed relation to the inner surface of the front panel portion of the pocket whereby to obviate puncture of the face panel by the magnet.

---

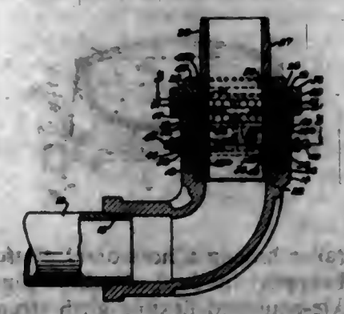
2,770,473
**METER READING CARD CONTAINER**
Frank Sedlacek, Cary, Ill.
Application January 16, 1956, Serial No. 559,234
5 Claims. (Cl. 281—44)

1. A container adapted to receive a stack of meter reading cards, including a bottom wall, and side walls integral with the bottom wall, a forward end wall, said forward end wall being formed with a vertical opening coextensive with the height of the side walls to permit gripping one end of the stack as an entity, said forward

wall being spaced from the bottom wall to form a horizontally extending slot to receive a card removed from said stack, said container including a rear end wall, of less height than the front wall, stack-engaging means operatively associated with the rear end wall, said means including laterally spaced guard fingers and an intermediate element extending between the fingers and adapted to engage the upper end of the stack, said stack engaging means embodying parallel rearwardly extending hinge ears, a cover element, said cover element including a top member, a surrounding depending flange integral with the top member, said flange being hingedly connected to the said ears and adapted to embrace the front and side walls and extending beyond the rear end wall to provide a handle element.

---

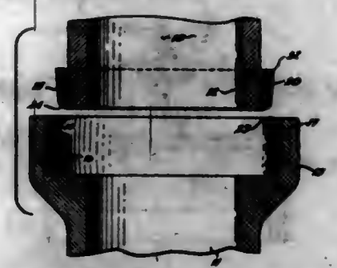
2,770,474
**VALVED SEPARABLE COUPLING**
John T. Kruge, Port Washington, N. Y.
Application December 23, 1952, Serial No. 327,601
1 Claim. (Cl. 284—18)



In a separable coupling device, a female member comprising a tubular body having an axial passage therein of one diameter and a second axial passage of a larger diameter with a valve seat formed therebetween, a valve reciprocally carried in said body, means constantly urging said valve into engagement with said seat, a sleeve reciprocally carried in said first passage with one end adjacent to said valve seat, said sleeve having a sealing face formed on the other end thereof, annular gasket means carried in said first passage in fluid-tight relation with said sleeve, a spider carried by the head of said valve and internally engaged with said sleeve so that the sleeve and the valve move in unison, a third passage in said member joining and larger in diameter than said first passage, cam levers carried on said body and having cams extending into said third passage, a male member inserted in said third passage and having a passage therethrough, a sealing ring adjacent to one end of said last member, and an external annular groove adjacent to said last end and releasably engaged by the cams of said cam levers for forcing said members together axially, whereby said sealing ring is first brought into engagement with the sealing face on the end of said sleeve, effecting a seal between said members, and further movement of said members by said cams causes the sleeve to move axially and open said valve.

---

2,770,475
**ROTATIVE SWING JOINT COUPLING WITH REPLACEABLE BUSHING**
Arthur W. Rafferty, Sacramento, Calif.
Application October 1, 1951, Serial No. 249,029
3 Claims. (Cl. 285—94)



1. A rotative connecting joint for conduit pipes, comprising a main body housing having a tubular faucet bell open at one end for connection of a continuation conduit member and having its opposite end free and open for retainively receiving therein the spigot end of another conduit member, said housing including a removable closure collar member at the free open end thereof, a replaceable bushing member snugly slidable in the housing and having an axial bore therethrough, a portion of said bore being of relatively greater diameter providing a shoulder, the radially inner wall of said bushing having circumferential and axially longitudinal relatively communicating grooved lubricating channels which also communicate with said bushing bore of greater diameter, a tubular spigot nipple member rotatively mounted in the bushing bore and having a circumferential radially outwardly extended bearing flange extending into the portion of the bushing bore of greater diameter, a race of ball bearings

in said bore of greater diameter on each of the opposite axially longitudinal sides of said flange, a wear ring within the housing at each of the opposite axially longitudinal sides of said races of ball bearings for receiving thereagainst the axially longitudinal wear thrust exerted upon the nipple flange, and means for lubricating the ball bearings and the rotation of the nipple in the bushing comprising a valve-controlled pressure operated filling nipple and a valve-controlled discharge vent intermediate the ends of the housing and the bushing therein and extending through said housing and bushing and communicating with said circumferential and longitudinal grooved channels.

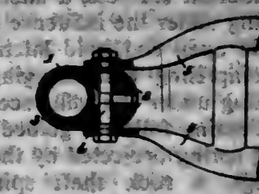
2,770,476
**PLASTIC INTERLOCKING SEALING MEANS FOR SEWER PIPE JOINTS**
Robert B. Cleverly, East Liverpool, Ohio, assignor to American Vitrified Products Company, Cleveland, Ohio, a corporation of New Jersey
Application September 8, 1953, Serial No. 378,952
7 Claims. (Cl. 285—231)

1. In a pipe joint between the bell end of one pipe section and the spigot end of an adjoining pipe section, a pair of annular sealing elements of deformable resilient material, one being in the form of a collar secured to the spigot end of said one pipe section and the other being in the form of a lining secured within the bell end of said other pipe section, the collar element having a tapering outer side wall and being wedged within said lining element for joint-forming purposes, the said lining element having an axially concave inner side wall, with the center of curvature of such inner side wall being substantially equidistant from the ends of the lining element.

2,770,477
**MECHANICAL SEAL**
Dan B. Rankin, Altadena, Calif., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application July 30, 1951, Serial No. 239,350
2 Claims. (Cl. 286—11.15)

2. In a mechanical seal for a rotatable member, a mounting member disposed around the rotatable member and having an annular recess in an end thereof, a support member snugly fitting at its outer periphery within said mounting member recess and in sealing engagement therewith, abutment members respectively integral with the mounting member and the support member and engaging each other in surfaces each of which extends both axially and substantially radially of the rotatable member to key the support member and the mounting member against relative rotary movement, means defining a socket in said support member concentric with the rotatable member, a seal ring disposed in said socket in sealing engagement with the support member and composed of brittle, dimensionally variable material having a smooth and highly polished seal surface facing outwardly of the socket, and a second set of abutment members respectively integral with the support member and the seal ring and engaging each other in surfaces each of which extends axially and substantially radially of the rotatable member to key the support member and the seal ring against relative rotary movement, said support member being formed of a material having sufficient shear strength to prevent severance of the abutment members of the seal ring, sufficiently yieldable to avoid overstressing the seal ring upon the occurrence of dimensional variation of the seal ring, and sufficiently resilient to maintain sealing engagement with said seal ring through the range of dimensional variation thereof occurring during normal operation of the mechanical seal.

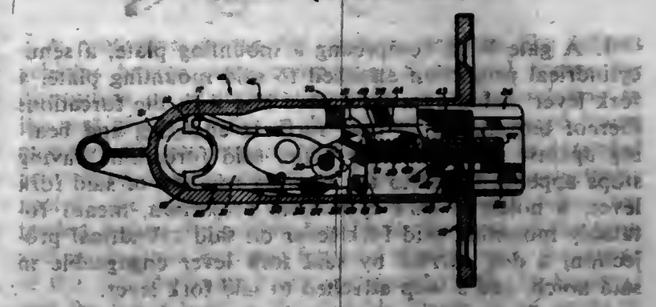
---



2,770,478
**PISTON ROD AND CRANK PIN CONNECTION FOR AQUARIUM PUMPS**
Eugene G. Danner, Brooklyn, N. Y.
Application November 12, 1952, Serial No. 319,816
1 Claim. (Cl. 287—96)

A connector for a piston rod and crank pin of the character described, including a pair of opposed separable symmetrical halves, each half having a substantially semi-cylindrical portion of maximum diameter and a convexly curved or bulging central portion, the semi-cylindrical portion in each case having a peripheral wall, said separable halves each having the central convexly curved portion thereof provided with a central convex portion having a central hole for a crank pin, said central convex portions with their central holes being alined to receive the crank pin simultaneously through both central holes, the semi-cylindrical portions of both halves being adapted to receive the piston rod therebetween, unitary means for securing said halves together along said semi-cylindrical portions and for securing the piston rod therewithin, a cylindrical sleeve intermediate said central convexly curved portions disposed within said convex portions, and a substantially flat circular body of lubricant-containing packing material disposed intermediate said convex portions and having a central opening receiving said sleeve therethrough, and said crank pin being adapted to be rotatably received through the alined central holes in said convex portions and through the sleeve therebetween.

---



2,770,479
**CYCLE SADDLE SUPPORT MOUNTING**
Hanns Hilber, Stuttgart, Germany, assignor to Alfred Kreidler, Stuttgart, Germany
Application September 18, 1952, Serial No. 310,216
Claims priority, application Germany October 29, 1951
2 Claims. (Cl. 287—119)

1. In a cycle-frame for a saddle, a saddle tube having an upper end portion of substantially oval cross section and of a configuration which has a larger dimension lengthwise than crosswise and slit longitudinally in a region adjacent its upper end, a support member for the said saddle disposed in the said saddle tube, jaw means housed within said upper end portion of the said saddle tube and presenting with said tube an opening receiving the said support member of the said saddle, the said support member of the said saddle engaging the said jaw means, and means for compressing the said saddle tube and said jaw means, whereby the said support member may be secured relative to the said saddle tube.

---

2,770,480
**DEAD LATCH STRUCTURE**
Thomas B. Linton, Huntington Beach, Calif., assignor to Kwikset Locks, Inc., Anaheim, Calif., a corporation of California
Application March 8, 1954, Serial No. 414,571
7 Claims. (Cl. 292—169)

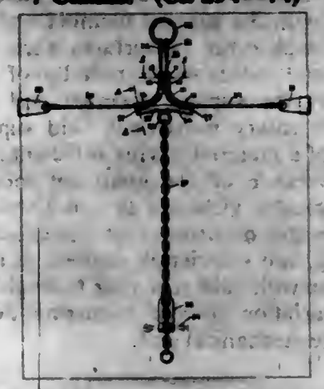
6. In a reverse action dead latch, the combination of: a housing; main and auxiliary bolts mounted in said housing; a retractor bar spaced from said main bolt movable toward the outer end of said housing to retract said bolts; a rotatable retractor mounted intermediate the ends of said housing in advance of said bar, said retractor having its lower end engaged with said bar and its upper end engaged with said main bolt; a dog on said retractor intermediate said upper and lower ends; and a dead locking lever pivotally mounted in said main bolt and engageable by said dog to render said lever inoperative during the retraction of said bolts.

2,770,481
**NARROW FRAME SCREEN DOOR LATCH**
Andrew Erkkila, Fitchburg, Mass., assignor to Independent Lock Company, Fitchburg, Mass., a corporation of Massachusetts
Application February 20, 1953, Serial No. 338,077
5 Claims. (Cl. 292—169)

4. In a latch having a short backset, a tubular casing having at one end a closed end wall and a guide opening at the other end, a pair of compression springs bearing against said end wall concentrically positioned on said end wall and of different stiffness, a latch bolt assembly guided by said casing under the influence of both springs guided through said open end, said latch bolt assembly having a shank comprising wall engaging branches extending in said casing under the influence of the weaker of said springs, a floating follower guided by said shank, said follower being spring projected by the stiffer of said compression springs, a rock shaft spindle extending through said casing between said branches having a camming portion actuating said follower whereby, upon rocking said spindle, the latch bolt is retracted against the influence of both compression springs and to project the latch bolt and follower under such influence, the latch bolt being independently depressible against the influence of the softer of the compression springs.

2,770,482
**GATE LATCH**
Alex B. Kasick, Newlin, S. Dak.
Application October 28, 1954, Serial No. 465,343
5 Claims. (Cl. 292—246)

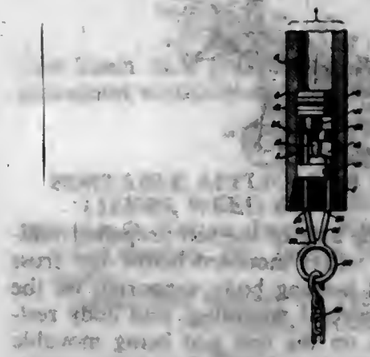
1. A gate latch comprising a mounting plate, a semi-cylindrical projection attached to said mounting plate, a fork lever including a bifurcated end with the furcations thereof terminating in cam surfaces engaging and bearing against said mounting plate, said furcations having stops appended thereto for limiting rotation of said fork lever, a notch in said cylindrical projection, means rotatably mounting said fork lever on said cylindrical projection, a dog carried by said fork lever engageable in said notch, and a loop attached to said fork lever.



2,770,483
**HAND WEED PICKER**
Leo Patnaude, Fairhaven, Mass., assignor of fifty percent to Helen M. Patnaude, Fairhaven, Mass.
Application December 14, 1953, Serial No. 398,024
1 Claim. (Cl. 294—50.9)

A hand weed picker comprising a handle, an elongated stationary jaw mounted at one end of the handle and extending endwise transversely thereof, an angular member pivotally secured at its angle to said handle adjacent said jaw, said member having one portion thereof extending lengthwise of said handle in the direction of said stationary jaw, an elongated movable jaw secured to said one portion and extending endwise transversely of the handle and movable by said portion into engagement with said stationary jaw, said movable jaw being of obtuse angle shape in cross section, said member having a second portion thereof extending transverse to said handle and means mounted adjacent the other end of said

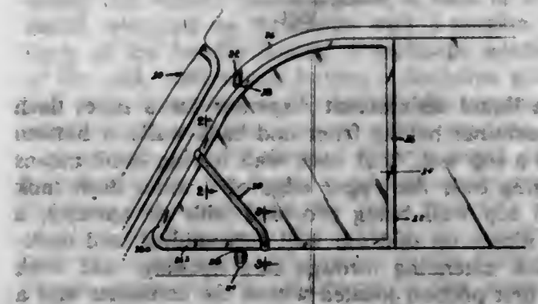
handle and connected to an end of said second portion of said member for moving said member whereby said movable jaw will be moved toward and away from one side of said stationary jaw, said stationary jaw having a longitudinal bottom edge flange on its opposite side extending laterally away from both jaws for fulcruming on the ground to lift both jaws for lifting weeds out of the ground.



2,770,484
**DOOR HANDLING DEVICES**
James T. Lunsford, Fort Worth, Tex.
Application October 26, 1955, Serial No. 542,846
7 Claims. (Cl. 294—74)

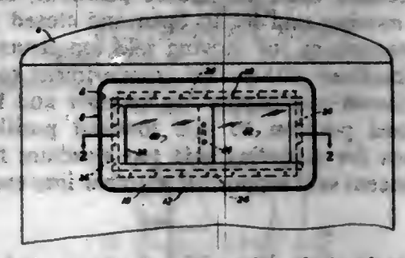
1. A handling device for applying or removing box car doors, said device comprising a yoke having a substantially vertical tubular section and oppositely extending substantially horizontal tubular section disposed below said vertical tubular section, a flexible member extending slidably through one of said horizontal tubular sections and said vertical tubular section, means on said flexible member adapted to engage one vertical side of a said door, a second flexible member extending slidably through the other of said horizontal tubular sections and said vertical tubular section, means on said second flexible member, adapted to engage the opposite vertical side of said door, hoist engaging means on said flexible members, a third flexible member suspended from said yoke, and a door engaging member carried by said third flexible member.

2,770,485
**FLOAT VALVE PULLER**
Boyd E. Hine, Lewistown, Mont.
Application July 8, 1952, Serial No. 297,671
1 Claim. (Cl. 294—90)

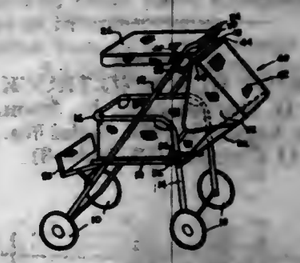


A float valve puller comprising: a unitary bifurcated member of resilient material having spaced apart leg portions rigidly joined together at one end at a central juncture, means rigid with said leg portions at said juncture for engaging an anchor member, the other end of each of said leg portions having a laterally extending hooking element formed thereon, said hooking elements extending in opposite directions transverse to a plane containing said legs and each being provided with a transverse surface

facing the said one end, each of said leg portions being twisted generally about its longitudinal axis in a direction to move its hooking element away from the other leg portion whereby tension in said legs causes said hook elements to pivotally move toward each other by the tendency of said leg portions to untwist resiliently under the influence of said tension.



2,770,486
**RAIN GUTTER FOR AUTOMOBILE VENTILATORS**
Aldo Del Noce, Brooklyn, N. Y.
Application July 15, 1953, Serial No. 368,155
1 Claim. (Cl. 296—44)

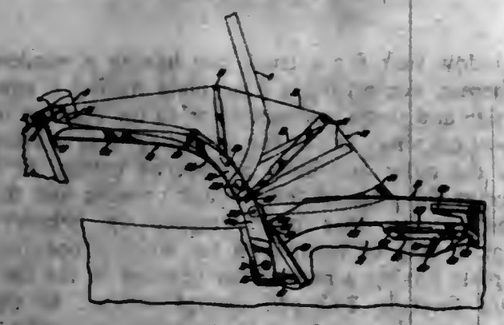


A rain gutter for a swingable ventilating window of an automobile, said window having a pane of glass mounted in a metal frame with yieldable gaskets between said pane of glass and said frame, said frame having a generally horizontal lower portion and a front portion which extends upwardly therefrom, said rain gutter comprising a channel-shaped member which is L-shaped in cross-section, one end of said rain gutter being provided with a clip-shaped portion which is adapted to be clipped to the front portion of said frame, said rain gutter being so oriented relative to said clip-shaped portion that it extends diagonally downwardly toward the lower portion of said frame when said clip-shaped portion is clipped to the front portion of said frame, the opposite end of said rain gutter being bent downwardly at an angle to the main body of said rain gutter and being provided with a pointed portion which is adapted to be inserted into said lower frame portion between its yieldable gasket and the pane of glass, and a resilient insert mounted within said rain gutter between its clip-shaped portion and its bent opposite end for engagement wtih said pane of glass to provide a water-tight seal between said pane of glass and said rain gutter.

2,770,487
**TRUCK WINDOW UNIT**
Jessie C. Isbell, Oklahoma City, Okla., assignor to Leo W. Barber, Oklahoma City, Okla.
Application October 6, 1954, Serial No. 460,707
2 Claims. (Cl. 296—47)

1. A window unit for a truck cab having a window opening therein, comprising a base plate having a contour of a size and shape corresponding to the contour of the window opening, an elastic retaining ring having grooves in the outer and inner peripheries thereof of a size to receive the edge of the window opening and the outer edge of the base plate respectively, whereby the base plate may be secured in the window opening, said base plate having a rectangular opening in the central portion thereof, Z-shaped clamps secured to the face of the base plate to form an inwardly opening U-shaped chamber around the last-mentioned opening, packing in said chamber having a pair of circumferential grooves in the inner periphery thereof, and a rectangular transparent panel slidingly supported in each of said grooves for covering and alternately partially uncovering the last-mentioned opening.

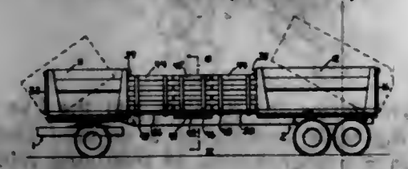
2,770,488
**PROTECTIVE STRUCTURES FOR STROLLERS**
Walter Gardner Kunholm and Robert E. D. Hebby, Gardner, Mass., assignors to Kunholm Mfg. Co., Gardner, Mass., a corporation of Massachusetts
Application April 15, 1954, Serial No. 423,378
1 Claim. (Cl. 296—107)



A protective device for strollers and the like infants vehicles having seats comprising a covered frame for disposition on a pusher handle in overlying relation to the seat of the stroller, a slidable nestable covered frame mounted thereon, means to hold the frames in extended articulated relation, means to hold the frames selectively nested, the slidable frame depending freely when extended, below the pusher handle to the rear of the seat, and an inclined backrest for said stroller seat, the cover of the slidable frame being engageable with the backrest and the latter holding the slidable frame at an angle to the seat and backrest.

2,770,489
**VEHICLE FOLDING TOP STRUCTURE AND POWER ACTUATING MEANS THEREFOR**
Louis P. Garvey, Karl A. Walter, and Robert L. Ballard, Detroit, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 1, 1951, Serial No. 244,784
52 Claims. (Cl. 296—117)

51. The combination comprising a stationary supporting member, a top structure movable between raised and

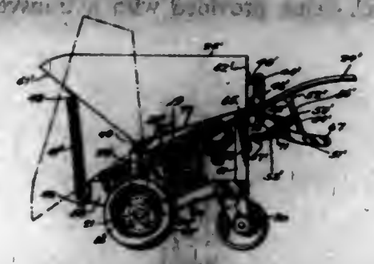


lowered positions, a bow supported on said top structure for movement therewith as said top structure is moved between raised and lowered positions and for movement independently of said top structure, a storage compartment for said top structure, a lid for said compartment movable between open and closed positions, first power means for moving said lid to open and closed positions, second power means for moving said top structure from a lowered position within said compartment to a raised position adjacent said supporting member and from said last-mentioned position to said lowered position, third power means for actuating said top structure from said position adjacent said supporting member into engagement

with the latter and from said last-mentioned position to said position adjacent said supporting member, fourth power means for moving said bow between a first position adjacent said lid when the latter is in closed position and a second position in spaced relationship with said lid, latch means for detachably securing said top structure to said stationary member when said top structure has been moved into engagement with the latter, power means for withdrawing said latch means, means for moving said latch means to latching position, a power circuit operatively connected to said first, second, third, and fourth power means, and control means in said circuit for causing said first, second, third, and fourth power means to operate in a predetermined order.

---

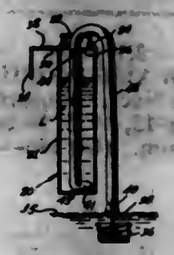
2,770,490
**MULTIPLE BODY DUMPING TRUCK TRAILER**
William D. Hockensmith, Jr., Irwin, Pa.
Application August 3, 1954, Serial No. 447,615
11 Claims. (Cl. 298—8)



1. A trailer adapted to be pulled by an automotive tractor, comprising a frame, separate dumping bodies mounted on the front and rear end portions of the frame, dump gates normally closing the outer ends of the bodies, the front body being pivotally mounted near its front end on the frame for dumping its load forward over the front end of the frame and the rear body being pivotally mounted near its rear end on the frame for dumping its load backward over the rear end of the frame.

---

2,770,491
**DUMPING VEHICLE**
Frank J. Parks, Moscow, Pa.
Application October 23, 1950, Serial No. 191,576
5 Claims. (Cl. 298—10)

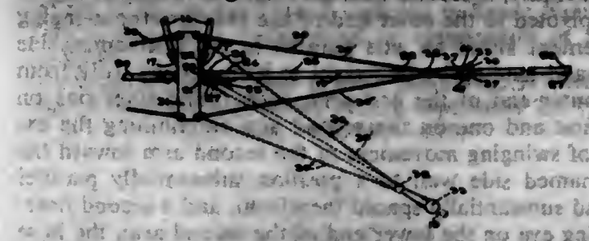


1. A hauling vehicle unit of the character described, including a self-propelled vehicle, having an axle and a pair of driving wheels mounted thereon, a material moving dump body-supporting frame adapted for detachable connection with the axle of the self-propelled vehicle, said frame comprising side bars having a cross connection at the ends remote from the vehicle axle, a rest for a material holding body extending upwardly from the cross-connection, trunnion supports extending vertically above the side bars, and having yoke members constructed and

arranged to hook over the axle of the self-propelled vehicle, at least one swivel wheel mounted below the cross member, and a material holding body supported on the trunnion supports by a pivotal mounting, said body resting in traveling position on the rest and being movable to dumping position by rotation about said pivotal mounting.

---

2,770,492
**DISPENSER FOR A LIQUID DISINFECTANT**
Robert S. Kaar, Broomall, Pa.
Application May 28, 1954, Serial No. 433,159
2 Claims. (Cl. 299—20)



1. In a liquid disinfectant dispenser for a toilet flush tank, a container having front and back walls, a bottom wall, and a top wall, said back wall having hook means for engaging over the upper edge of a toilet flush tank wall, said top wall being provided with an opening, a threaded nipple on said top wall surrounding said opening, a wick extending through said opening, said wick having a first portion located within the container and a second portion outside of the container and depending along said front wall, said second portion of the wick having a lower end normally positioned below the container, and a closure cap secured to the lower end of said second portion of the wick arranged to thread over said nipple when the wick is positioned within the container, said cap serving in the normal position of said second wick portion to hold the lower end of said second wick portion below the container.

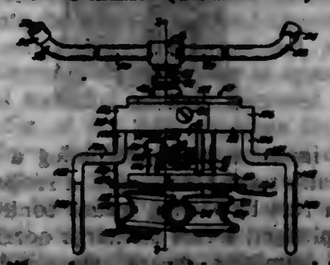
---

2,770,493
**SPRAY BOOM**
Walter F. Fisher, Sanville, Wis., assignor to Food Machinery and Chemical Corporation, San Jose, Calif., a corporation of Delaware
Application June 26, 1952, Serial No. 295,698
16 Claims. (Cl. 299—39)

12. In a spraying unit, a support frame, a boom mounted for free universal movement on said frame, an adjustable clamp mounted on the boom, guys adjustably connected to said clamp, means on said clamp to provide slidable movement thereof in a direction axially of said boom for adjusting said guys, and means connecting said guys to said frame above and on opposite sides of the universal mounting of the boom on the frame to support

said boom in a predetermined position and for guided movement vertically and laterally from said position.

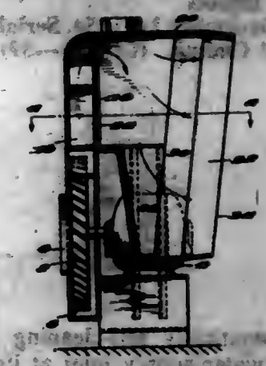
---



2,770,494
**PORTABLE APPLICATOR FOR LIQUID FERTILIZERS, WEED KILLERS, AND THE LIKE**
Maurice O. Nelson, Iconia, Wis., assignor to The Farnwell Company, Inc., Iconia, Wis., a corporation of Wisconsin
Application January 14, 1955, Serial No. 481,739
6 Claims. (Cl. 299—43)

1. A device for evenly applying liquids to turf and soil, comprising: a frame having handle means; wheels mounted on the frame and supporting it for free travel across the surface to be treated; a tank to contain the liquid, mounted on the frame with a portion thereof in front of the handle means; a discharge nozzle in front of the tank, said nozzle having a discharge port of fixed size shaped to produce a relatively flat arcuate spray of substantially uniform density which projects forwardly and to both sides to thereby cover a swath of predetermined width as the device is pushed along; a connection between the nozzle and the tank, including means for shutting off flow from the tank to the nozzle; a piston type air pump fixed with respect to the frame and tank; means connecting the discharge of the pump with the tank; and actuating means for the piston of the pump including a crank pin on one of the wheels and a connecting rod between the crank pin and the piston rod so that the movement of the device across the surface to be treated produces a pressure in the tank.

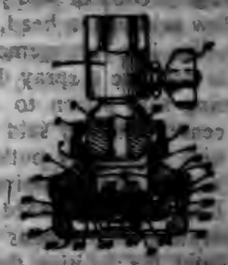
---



2,770,495
**TRAVELING LAWN SPRINKLER**
William D. Egly, South Bend, and Columbus W. Harris, Elkhart, Ind., said Harris assignor to said Egly
Application October 8, 1948, Serial No. 53,492
22 Claims. (Cl. 299—50)

1. A travelling lawn sprinkler comprising a housing adapted to be connected to a flexible water conduit, a water reactance sprinkler unit rotatably mounted by said housing and rotatable drive members actuated by said unit and including a pair of rotatable members gripping said conduit therebetween to propel said housing.

---



2,770,496
**AUTOMOBILE DRIER**
Earl Wilson, Long Beach, Calif.
Application January 4, 1954, Serial No. 401,788
3 Claims. (Cl. 299—58)

1. An automobile drier comprising a rotary fan, a diffuser chamber of increasing cross-section connected to the outlet of the fan, a muffler chamber connected to said diffuser chamber, said muffler having a vertical extension therefrom adjacent one side thereof and offset therefrom in a direction transverse to the axis of rotation of the fan, and converging plates arranged in substantially vertical planes forming a nozzle communicating with said muffler chamber and said extension, the nozzle opening comprising a relatively narrow, vertically elongated slit.

---

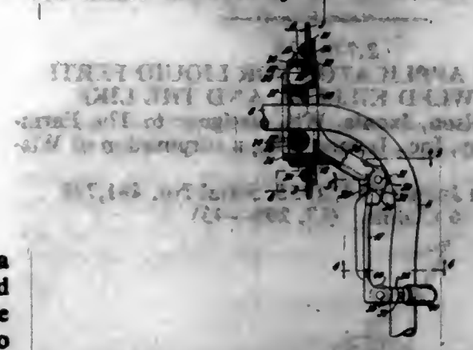
2,770,497
**AUTOMATICALLY SELF-CLEANING SHOWER HEADS**
Jacques J. Fillberg, Chicago, and James J. Swartz, Berwyn, Ill., assignors to Sloan Valve Company, Chicago, Ill., a corporation of Illinois
Application January 6, 1954, Serial No. 402,536
6 Claims. (Cl. 299—89)

1. In an automatically self-cleaning shower head, a casing having a water passage therethrough, a flexible diaphragm arranged normally across the bottom of said casing across said water passage, and having openings therein for water passage, a cap threaded onto the bottom of said casing, said cap having a large spray discharge opening therein spaced below said diaphragm, a spray dispersing disc attached to the bottom of said diaphragm and spaced from said spray discharge opening, a pressure member attached to the top of said diaphragm and normally extending into said water passage, said pressure member being movable responsive to water flow into said water passage to cause flexing of said diaphragm away from the bottom of said casing, said diaphragm thereby projecting said spray dispersing disc into said spray discharge opening, said pressure member having openings in the sides thereof registering with the bottom of said casing when moved whereby water can only flow through said openings from said water passage when said spray

dispersing disc is in engagement with said spray discharge opening, said flexible diaphragm restoring said pressure member and spray dispersing disc to normal position when water flow through said device ceases.

---

2,770,498
**AUTOMATIC SELF-CLEANING SHOWER HEADS**
Jacques J. Filliung and Robert E. Campbell, Chicago, Ill., assignors to Sloan Valve Company, Chicago, Ill., a corporation of Illinois
Application December 21, 1954, Serial No. 476,684
7 Claims. (Cl. 299—59)



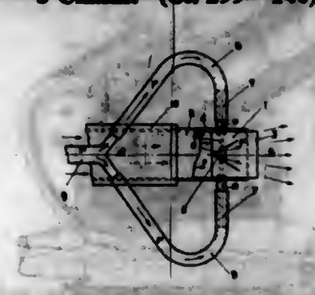
3. In an automatically self-cleaning shower head, a casing having a water supply inlet at its upper end and a spray discharge outlet at its lower end, a guiding plate arranged across said casing and dividing the same into a pressure chamber and a discharge chamber, a piston having a hollow stem extending through an opening in said guiding plate, a piston head on the top end of said stem arranged in said pressure chamber, said piston head comprising a pressure disc arranged across the upper end of said pressure chamber and having its edge portion in slidable contact with the walls of said pressure chamber during the full stroke of said piston, a spray disc on said stem arranged in said discharge chamber and spaced from said discharge outlet, said hollow stem having openings at the bottom end extending into said pressure chamber and directly adjacent the top side of said guiding plate, water flow into said pressure chamber forcing said piston head downward together with said stem to project said stem openings into said discharge chamber, said piston head effective to force the water flow to take place only through said stem opening and to prevent flow around the edge portion of said piston into said pressure chamber below said piston head, said stem also carrying said spray disc into engagement with said spray discharge outlet to produce a spray discharge therefrom, means for returning said piston to its normal position after water flow ceases whereby said spray disc provides a wide opening with said spray outlet to drain the discharge chamber, a stop in said casing contacted by said piston head for limiting the upward movement of said piston, and cooperating stop means on said spray disc and said spray outlet for limiting the downward movement of said piston.

---

2,770,499
**HOSE GUIDE FOR FLUID DISPENSING APPARATUS**
Edward D. Ragsdale, Agawam, Mass., assignor to Gilbert & Barker Manufacturing Company, West Springfield, Mass., a corporation of Massachusetts
Application October 18, 1954, Serial No. 462,829
5 Claims. (Cl. 299—77)

1. In a fluid dispensing apparatus, having a housing with upstanding front, rear and side walls and a top wall, a dispensing hose stored in part within said housing and extending out of the same through one of said side walls, a first hose-guiding arm having a tubular hub mounted on the last-named side wall near the upper end thereof for swinging movement about an axis normal thereto and affording a first guiding eye through which the hose passes out of said casing, said first arm extending outwardly from the last-named side wall terminating with its outer end spaced therefrom and tending by its weight to hang downwardly, a second hose-guiding arm having its upper end pivoted to the outer end of the first arm for swinging movement about an axis parallel to the last-named side wall and tending by its weight to hang downwardly from the outer end of the first arm, cooperating stops one on the first and one on the second arm for limiting the extent of swinging movement of the second arm toward the last-named side wall to a position substantially parallel to and substantially spaced therefrom, and a second hose-guiding eye on the lower end of the second arm, the hose passing from the first eye to and through the second eye and thence downwardly therefrom, said second eye encompassing the hose peripherally to a sufficient extent to prevent the hose from being moved out of the eye in all directions radially of the latter, the axis of said second eye being substantially parallel to the second arm, a pull on the hose in a direction outwardly from the last-named side wall causing the second arm to swing outwardly therefrom and upwardly moving the second eye more nearly into alignment with the first eye, a pull on the hose toward either the front or the rear wall swinging both said arms about the axis of the first eye and carrying the second eye outwardly toward either the front or rear wall and positioning it to guide the hose around and out of contact with the corner where the last-named side wall intersects either the front or the rear wall.

---

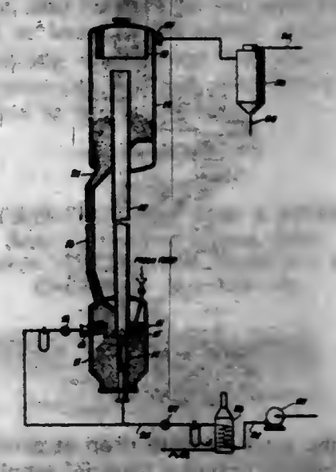


2,770,500
**FUEL INJECTION DEVICE**
John Dickson, Huntington Woods, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 24, 1954, Serial No. 470,855
7 Claims. (Cl. 299—107.2)

1. A fuel injection pump including a longitudinally fixed and axially rotatable plunger, a reciprocating pump cylinder with fuel by-passing means controlled by rotation of said plunger, a fuel discharge nozzle fixed to the cylinder and camming means interposed between the cylinder and plunger operable to rotate the nozzle during reciprocation.

2,770,501
**MEANS FOR THE ATOMIZATION OF LIQUIDS**
Henri Coanda, Paris, France, assignor to Sebac Nouvelle S. A., Lausanne, Switzerland, a corporation of Switzerland
Application September 1, 1953, Serial No. 377,898
Claims priority, application France September 23, 1952
5 Claims. (Cl. 299—140)

1. Device for atomizing at least one liquid comprising, in combination, a conduit adapted to have a fluid circulated therethrough, at least one airfoil wing having a substantially symmetrical profile and including an extrados, an intrados, a leading edge disposed inside said conduit, a trailing edge disposed outside said conduit and a pair of lateral sides disposed between marginal shields in the portion of said wing corresponding substantially to laminar flow of said fluid along said extrados and said intrados of said wing, a substantially triangular opening in said wing disposed in the zone of depression created by the flowing of said fluid along said wing and having the apex thereof directed towards the leading edge of said wing and the base thereof disposed inside said conduit at a substantial distance from and in a substantially parallel relationship to said trailing edge of said wing, and means for projecting at least two jets of said at least one liquid into colliding relationship in said opening.

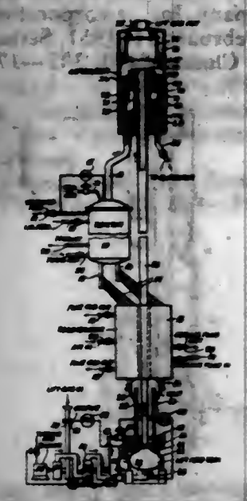


---

2,770,502
**REMOTE CONTROL FAUCET**
Walter D. Hodge, Kansas City, Kans., assignor to Manley, Inc., Kansas City, Mo., a corporation of Missouri
Application August 2, 1954, Serial No. 447,359
2 Claims. (Cl. 299—140)

1. In a mixing faucet for carbonating beverages, a hollow body having a chamber for receiving a syrup and a chamber for receiving a pressurized carbonating fluid; a supply conduit communicating with each chamber respectively; a nozzle mounted on the body below the fluid chamber and provided with an outlet at its lowermost end; a syrup outlet tube carried by the body and extending downwardly from the syrup chamber through the fluid chamber and into the nozzle, said fluid chamber having a frusto-conical outlet at its lowermost end, progressively increasing in diameter as the nozzle is approached; and a frusto-conical metering member mounted on the tube within said outlet of the fluid chamber for controlling flow of fluid from the fluid chamber and directing the same into the nozzle and against the inner face of the latter, the space between the wall of said body forming the frusto-conical outlet and the metering member progressively increasing as the lowermost end of the latter is approached whereby the pressure of said fluid is gradually released into the nozzle.

2,770,503
**METHOD AND APPARATUS FOR PNEUMATIC TRANSFER OF GRANULAR CONTACT MATERIALS**
Jean M. Bourgeat, Westville, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application February 16, 1951, Serial No. 211,343
8 Claims. (Cl. 302—17)

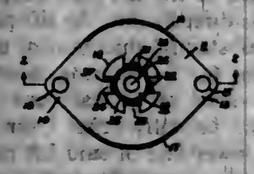


1. A gas lift for conveying upwardly granular material comprising a substantially vertical elongated lift pipe, a separating vessel at the top of the pipe, a feeding vessel at the bottom of the pipe, means for introducing a granular material into the feeding vessel to form a compact column of particles about the bottom of the lift pipe, an upwardly directed pipe terminating in the feeding vessel near the bottom of the lift pipe adapted to introduce primary lifting gas directly into the lift pipe without passing through any substantial thickness of the bed of granular material, means for introducing secondary lifting gas into the feeding vessel at at least one location outside of the lift pipe and laterally offset from its axis and far enough from the lower end of said lift pipe to cause said secondary lifting gas to pass through a substantial thickness of the bed of granular material, the lower end of the lift pipe tapered outward gradually from substantially vertical along a substantially hyperbolic spiral curve to a minimum slope at the bottom of the pipe, means for withdrawing separated lift gas from the separator and conduit means for withdrawing granular material from the bottom of the separating vessel.

---

2,770,504
**METHOD FOR TRANSFER OF CONTACT MATERIALS**
Jean M. Bourgeat, Woodbury, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application February 14, 1951, Serial No. 210,942
5 Claims. (Cl. 302—53)

1. A method for pneumatically transferring granular solid material from a zone at one elevation to a second zone at a higher elevation without excessive attrition and breakage of the solid granules which comprises, forcing the solid material from said first zone into the lower end of a confined lift passage extending upwardly from the zone at the lower elevation to a separation zone at the higher elevation, said separation zone being of substantially greater horizontal cross-section than said lift passage, carrying the granular material upwardly, suspended in a suitable lift gas through said lift passage and discharging it from the upper end of said passage upwardly into said separation zone where the granular material rapidly decelerates and then drops down onto a retaining surface shortly below the upper end of said lift passage in said separation zone, observing the pressure drop due to the flow across the total length of said lift passage regulating the rate of granular material entry to

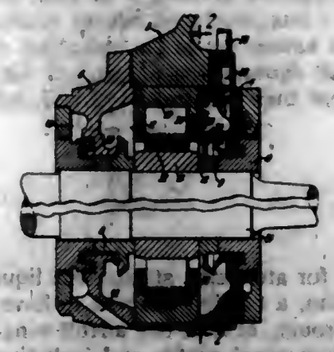


said lift passage to a fixed value and adjusting the total rate of gas supplied to the lower end of said lift passage

to maintain the total pressure drop at a minimum value for the fixed rate of granular material supply.

---

2,770,505
BEARING
Richard H. Jordan, Mansfield, Ohio
Application March 19, 1953, Serial No. 343,350
6 Claims. (Cl. 308—72)



1. A bearing support and self-aligning bearing, comprising a body of spring sheet material, said body having a surface defining an aperture, four ears extending inwardly from said surface, adjacent ears being bent differently and opposite ears being bent similarly thereby establishing first and second opposite ears in a first plane and third and fourth opposite ears in a second plane, a generally spherical bearing having a given diameter and having two flattened faces, a surface defining a journal in said bearing and having an axis substantially normal to said flattened faces, said ears being spaced to frictionally grip said bearing, the spacing between the ends of all said ears on one side of said body being slightly greater than the thickness of said bearing between said flattened faces in one direction and greater than the said given diameter in a direction perpendicular to said one direction to permit assembly by passing said bearing flattened faces between the two opposite ears in one of said first and second planes with the bearing axis in a plane generally parallel to said body and then tumbling said bearing ninety degrees into a position so that said bearing axis is generally normal to the plane of said body wherein each ear frictionally grips said bearing at substantially equidistant points from the nearest flattened face.

---

2,770,506
LUBRICATION MEANS
William J. Derner, La Grange, Ill., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application December 29, 1952, Serial No. 328,478
3 Claims. (Cl. 308—187)

1. A motor bearing having lubrication means therefor including a housing having a bearing cavity formed therein, a bearing assembly positioned within said cavity, said bearing assembly including an inner race, an outer race, and a cage positioned between said races and rotatably retaining a plurality of roller bearings therebetween, a rotatable shaft supported by the inner of said races, means to conduct oil mist to said cavity, and an arcuate shaped baffle having a substantially flat surface portion

and an open pocket communicating with said means to conduct oil mist to said cavity, said arcuate shaped baffle being positioned within said cavity so that said flat surface portion is immediately adjacent end faces of said inner and outer races and said cage and roller bearings to direct oil mist between said races, said cage, and said rollers to effect lubrication thereof.

---

2,770,507
GREASE RELIEF FITTING
Fred H. Ehnis, Philadelphia, Pa., assignor to Keystone Lubricating Company, Philadelphia, Pa., a corporation of Pennsylvania
Application December 3, 1954, Serial No. 473,823
10 Claims. (Cl. 308—187)

1. A grease relief fitting for use in lieu of the conventional removable relief plug in an anti-friction bearing housing and the like, said fitting consisting of a body member and a closure assembly, said body member having a smooth axial bore therethrough, one end of which provides a grease inlet for the fitting, said inlet end of the body member being formed with a nipple portion surrounding said bore having means for engaging and securing said fitting within the grease relief opening in a bearing housing, the opposite end of said bore being enlarged and providing a grease outlet or relief opening, the minimum diameter of the axial bore being only slightly less than the diameter of the hole in the bearing housing into which the grease inlet end of the fitting is adapted to be mounted, the bore in the body member inwardly beyond the nipple portion flaring outwardly toward the grease outlet end whereby to provide maximum relief and minimum resistance to outflow of grease through the fitting, and said closure assembly comprising a manually operable closure member movable into and out of closing relation to the said opposite end of the bore and means for captively holding said closure member in open or closing position onto the fitting.

2,770,508
CAM FOLLOWER BEARING
Richard J. Smith, Valparaiso, Ind., assignor to McGill Manufacturing Company, Inc., Valparaiso, Ind., a corporation of Indiana
Application March 7, 1955, Serial No. 492,680
2 Claims. (Cl. 308—187.1)

1. A sealed cam follower type bearing including in combination a one-piece stud member having a circular head plate at the outside end thereof, an inner raceway portion adjacent the head plate of lesser diameter than the head plate, and lubricating duct-means opening into said inner raceway portion, an annular retainer plate fixedly carried on said stud member at the inside end of said inner raceway portion, a cylindrical outer race ring retained against longitudinal movement by said head plate and said retainer plate and having thereon a central portion as the outer raceway for the bearing, said outer race ring having an annular groove at each end of said raceway portion and each groove being formed at its outer end by an annular flange of the outer race ring and at its inner end by the outer raceway portion, each of said annular flanges having an annular edge of greater diameter than the diameter of the outer raceway portion and each said groove being of greater diameter at its base than the diameter of the annular edge of the adjacent flange, rollers in the bearing confined between the two raceway portions, and means cooperating with said annular grooves and with said annular flanges and acting when the bearing is installed in an operating apparatus to store at said rollers lubricants fed through said duct-means and to minimize the introduction of dirt into the bearing at the rollers, said cooperating means including a first annular non-metal sealing member maintained in a press-fit on the circumference of said head plate and a second annular non-metal sealing member maintained in a press-fit on the circumference of said retainer plate, with each of said two sealing members as maintained on the stud member being of a size as to extend into a respective one of said grooves in the outer race ring so as to substantially fill the groove but each of said two sealing members adapted to be in a sliding relation with its respective groove when the bearing is installed in an apparatus and there is relative rotation between said outer race ring and said stud member.

2,770,509
DOUBLE ROW ROLLER BEARING
August Gunnar Fernlund Wallgren, Gothenburg, Sweden
Application November 25, 1952, Serial No. 322,470
Claims priority, application Sweden November 28, 1951
2 Claims. (Cl. 308—214)

1. A double row roller bearing comprising inner and outer bearing members and rollers disposed therebetween, said members having surfaces for axially fixing the rollers in both directions between the members, a retainer comprising an annular retainer portion and a plurality of separating portions projecting between the rollers from said annular portion to maintain the rollers in each row in desired peripherally spaced position, a holder ring rigidly secured to one of said bearing members for preventing said retainer from displacement out of the bearing, said holder ring and said retainer having inclining and at least approximately spherically curved surfaces in sliding engagement for preventing the retainer from becoming wedged upon taking an inclined position relative to the holder ring.

---

2,770,510
PACKING MEANS FOR A PISTON
John E. Collins, Akron, Ohio
Application May 25, 1954, Serial No. 432,194
15 Claims. (Cl. 309—4)

1. In combination, inner and outer relatively movable members, a generally annular packing means carried by one of said members, said annular packing having a cross-section including displaced O-ring portions and having a connecting web extending between the O-ring portions, the diameter of each O-ring portion in cross section being larger than the thickness of said web, and means on said one member to interlock one of the O-ring portions therewith with said other O-ring portion bearing against said other member in sealing relationship.

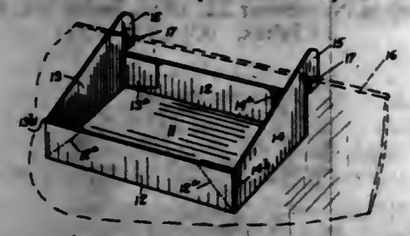
---

2,770,511
WRIST PIN ASSEMBLY
Robert J. Powell, Muskegon, Mich., assignor to Continental Motors Corporation, Detroit and Muskegon, Mich., a corporation of Virginia
Application November 22, 1954, Serial No. 470,350
3 Claims. (Cl. 309—19)

1. A piston and wrist pin assembly for an engine comprising a pin constructed of a soft material such as aluminum or the like and of a total length substantially equal to the diameter of the piston to which it is assembled, said piston having diametrically opposed wrist pin bearing bores, a sleeve fitted on the medial portion of said pin and constructed of a steel material having a hardened outer cylindrical surface, said sleeve bore having internally champfered ends forming an annular recess, said pin having reduced diameter end portions providing an annular shoulder axially spaced inwardly from the ends of said pin, and an outwardly swaged pin part distorted from said shoulder portion and forced into said annular recesses of the sleeve to secure and locate said sleeve on said pin, said medial enlarged diameter portion of said

pin having a length slightly less than the overall length of said sleeve and greater than the length of the straight internal bore of said sleeve, said end faces of the axial pin being unaffected by said swaging and comprising the only part of said wrist pin assembly that may contact the engine cylinder wall with which said piston is operable.

---

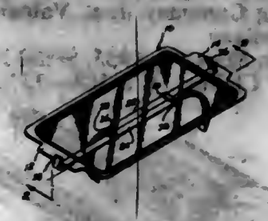


2,770,512
UNIT PISTON RING
Douglas W. Hamm, Muskegon, Mich., assignor to Muskegon Piston Ring Company, Muskegon, Mich., a corporation of Michigan
Application January 21, 1955, Serial No. 483,321
6 Claims. (Cl. 309—44)

1. A piston ring comprising, a circumferentially compressible, flexible, circular spacer having a parting at one side thereof, horizontal spaced connected segments, and lips at the inner edges of said segments extending away therefrom at an angle to the horizontal, and a plurality of thin, arcuate rail sections releasably secured to said segments around said spacer at the outer sides thereof having inner edges substantially against said lips, the ends of the rail sections at said parting being aligned with the ends of said spacer at the parting, and adjacent ends of ring sections opposite said parting being spaced from each other, the radius of curvature of said spacer being greater than the radius of curvature of said ring sections in normal uncompressed condition, and substantially equal therewith in circumferentially compressed condition.

---

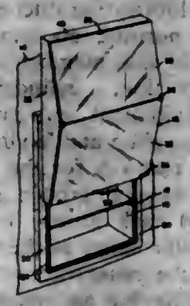
2,770,513
HOOKED CURB SERVICE TRAY
Julius Brown, Indianapolis, Ind.
Application March 8, 1954, Serial No. 414,784
1 Claim. (Cl. 311—22)



A service tray comprising a bottom panel and side and end walls formed of a fibre board type material, said end walls each being similarly tapered to provide gradually increasing height in said end walls from one end thereof to the other, and a tab and hook formed at the higher end of each end wall, said tab being hingedly connected to said higher end and engageable with the inner surface of the adjacent side wall for adding strength thereto and said hook projecting beyond the vertical plane of the adjacent side wall for engagement with the window-pane of an automobile.

---

2,770,514
LUNCH TRAY HOLDER
Ingham Ideo, Fargo, N. Dak.
Application November 29, 1954, Serial No. 471,826
10 Claims. (Cl. 311—23)



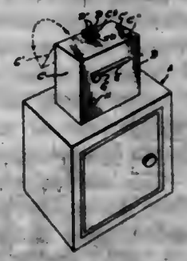
1. A tray and a holder therefor, said holder comprising a pair of relatively slidable members positioned below the tray so as to rest across the legs of a user and having upwardly extending flanges for engaging opposite edges

of said tray and downwardly extending flanges for engaging the legs of said user.

---

2,770,515
MEDICINE CABINETS
Dwight La Barre, Detroit, Mich., assignor to Ornes and La Barre, Centerline, Mich., a partnership
Application July 27, 1953, Serial No. 370,536
2 Claims. (Cl. 312—209)

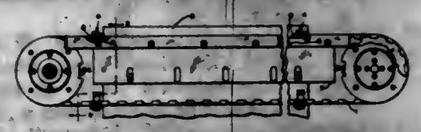
2. In a medicine cabinet of the type described, a cabinet body in the form of a recessed box structure having vertical side affixed door guides, a sliding door for said box structure vertically arranged in said guides and having an inwardly extending lower flange, a horizontal shelf fixed in said cabinet body defining said cabinet into upper and lower compartments, said shelf supporting a flexible, retractable door catch projecting outwardly from said shelf in overlapping relation with said lower flange of said door and positioned to releasably limit upward travel of said door in said guides, said door being releasably stopped in its upper travel by said door catch at a position fully exposing said lower compartment, said door catch being retractable from its stop position against said door flange to permit further upward travel of said door whereby said upper compartment is exposed to full access, said flexible door catch being urged inwardly of said cabinet body upon downward travel of said sliding door by said door flange, whereby said upper and lower compartments are closed to access upon reaching the lower limit of travel by said sliding door, said flexible retractible door catch being disposed in the said lower compartment and exposed to full access when said sliding door is raised to expose the lower compartment and to mask said upper compartment.



---

2,770,516
DEPOSITING MACHINES
Luis Mestre, New York, N. Y., assignor to The Mosler Safe Co., New York, N. Y., a corporation of New York
Application May 11, 1953, Serial No. 354,014
33 Claims. (Cl. 346—22)

1. Deposit apparatus for use with a deposit package having two portions, the upper one being adapted to become a receipt and the other, when separated from the receipt portion, to be accepted as a deposit, said apparatus including a safe having an opening in the top thereof; a lockable housing secured to the top of the safe above said opening and having a deposit receiving



opening in the top thereof above the top opening in the safe; and a depositing machine in said housing, said machine having a vertically disposed, upwardly opening, stationary package receiver accessible through the housing opening and having means to support a deposit package in pendent position; a stationary chute below the package receiver and open at the top and bottom, a normally closed upper door above the chute and adjacent the package receiver, a normally open lower door below the chute, severing mechanism below the upper door, and manually operable mechanical means movable from a normal or home position through a cycle and back to

the home position thereof, including means for maintaining the upper door closed and the lower door opened, means for thereafter closing the lower door and holding it closed while it opens the upper door so that a package may be placed in the deposit support while access to the safe is denied, and means for then closing the upper door and opening the lower door, and means controlled by the manual means for actuating the severing means to sever the deposit portion from the receipt portion while the lower door is open so that the deposit portion drops into the safe under the influence of gravity.

---

2,770,517
FACSIMILE SCANNING MECHANISM
Douglas M. Zabriskie, Northvale, N. J., assignor to The Western Union Telegraph Company, New York, N. Y., a corporation of New York
Application March 18, 1954, Serial No. 417,057
8 Claims. (Cl. 346—74)

1. In a facsimile recorder of the kind employing electric writing on a sheet of electrosensitive paper, in combination, a belt of flexible organic materal, metallic tension strands embedded longitudinally in the interior thereof, cogs formed on the inner surface thereof, a pair of belt carrying pulleys constructed of readily moldable material and having recesses in the faces thereof, metallic hubs in the said pulleys, a plurality of stylus carrying stylus holders affixed to the said belt, styluses in the said holders, means for guiding the said stylus holders in a linear track, a conductive bar fixed adjacent the path of travel of said stylus holders in sliding contact therewith, and a sheet of electrographic paper advanceably retained in the path of travel of said styluses.

## CHEMICAL

2,770,518
DYED TEXTILE MATERIALS AND METHOD OF MAKING
Anthony B. Conciatori, New Providence, and Victor S. Salvin, Irvington, N. J., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware
No Drawing. Application October 20, 1952, Serial No. 315,824
16 Claims. (Cl. 8—18)

1. Process for improving the resistance to gas fading of a dyed textile material having a basis of an ester selected from the group consisting of cellulose acetate and polyethylene terephthalate and dyed with a blue anthraquinone dye which exhibits a tendency to gas-fading on said material, which comprises applying a polymeric dialkyl-amino-alkyl-ecrylate wherein the alkyl and alkylene groups contain at most 6 carbon atoms to the said dyed textile material.

---

2,770,519
CARROTING PROCESS AND SOLUTION
Egon Eisd, Badenweiler, Germany
No Drawing. Application September 15, 1954, Serial No. 456,315
Claims priority, application Germany September 26, 1953
5 Claims. (Cl. 8—112)

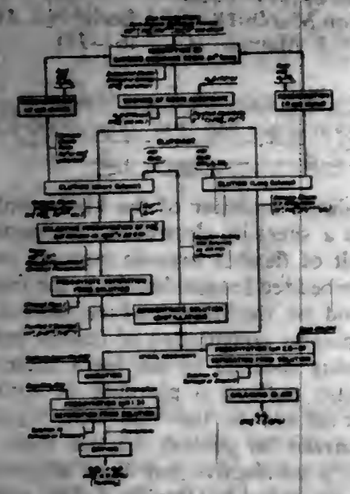
1. A method of producing hair felt including the step of subjecting fur fibers to the action of a carroting solution containing at least one oxidizing agent of the group consisting of hydrogen peroxide and persalts in an amount corresponding to not more than about 5 percent by volume of 100% hydrogen peroxide, an acid of the group consisting of nitric acid and hydrochloric acid in an amount of about 3 to 10 percent by volume, calculated on 100% acid, and formamide in an amount of about 2 to 10 percent by volume.

2,770,520
RECOVERY OF URANIUM FROM PHOSPHORIC ACID AND PHOSPHATE SOLUTIONS BY ION EXCHANGE
Ray S. Long, Solano, and Richard H. Ballou, Walnut Creek, Calif., assignors to the United States of America as represented by the United States Atomic Energy Commission
Application April 11, 1950, Serial No. 155,307
9 Claims. (Cl. 23—14.5)

1. In a method for recovering uranium values from a phosphoric acid solution, the steps comprising oxidizing said uranium in solution to the VI oxidation state, whereby uranyl phosphate complex anions are formed therein, contacting the oxidized solution with an anionic exchange resin to adsorb said uranyl complex anions thereon, and then eluting adsorbed uranium from said exchange resin with an acidic solution and an adjunct reducing agent.

---

2,770,521
SEPARATION OF URANIUM FROM MIXTURES
Louis Spiegler, Woodbury, N. J., assignor to the United States of America as represented by the United States Atomic Energy Commission
No Drawing. Application October 20, 1944, Serial No. 559,665
11 Claims. (Cl. 23—14.5)



1. The method of obtaining uranium peroxide from a uranium-containing sulfate mixture which comprises forming a solution of the uranium sulfate in hexavalent form in aqueous sulfuric acid solution having an initial pH between 2 and 5, adding sufficient peroxide to completely convert uranyl sulfate in the solution to uranium peroxide, subsequently adding sufficient alkaline reagent to bring the pH of the solution to between 2 and 5, effecting crystallization of the uranium peroxide from the solution, and separating the crystallized uranium peroxide from the solution.

2,770,522

## METHOD OF PURIFYING AND RECOVERING VANADIUM FROM PHOSPHATE-CONTAINING SOLUTIONS

Richard H. Bailes, Walnut Creek, and Robert R. Grinstead, Concord, Calif., assignors, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission

Application June 5, 1952, Serial No. 291,946
16 Claims. (Cl. 23—19)

1. In a process for purifying and recovering vanadium values from a solution containing tetravalent vanadium cations and an inorganic phosphatic impurity, the steps comprising adsorbing the tetravalent vanadium on a cationic exchange resin, whereby a portion of the phosphatic impurity is also adsorbed thereon, washing the resin with water thereby removing a portion of the phosphatic impurity from the resin, eluting the vanadium from the resin with an aqueous elutriant means, and recovering the vanadium from the eluate.

2,770,523

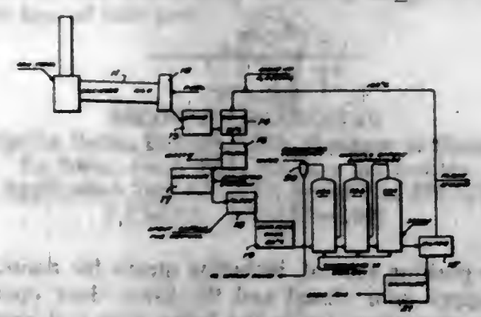
## FERRO-MAGNETIC COBALT AND NICKEL MANGANESE OXIDES HAVING THE ILMENITE-TYPE CRYSTAL STRUCTURE

Richard C. Teale, Grand Island, N. Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application August 26, 1954, Serial No. 452,449
13 Claims. (Cl. 23—58)

1. The crystalline form of a complex oxide of manganese, corresponding to the formula $MMnO_3$ wherein M is a group VIII metal selected from the class consisting of cobalt and nickel, characterized by having a crystal structure of the ilmenite-type and by being ferromagnetic.

8. Process for preparing a ferromagnetic crystalline complex oxide of manganese which comprises heating a mixture of manganese dioxide and a simple oxide of a metal selected from the class consisting of cobalt and nickel at a temperature of at least 500° C., and under a pressure of at least 1000 atmospheres, and separating as the resulting product a crystalline complex oxide of manganese and a metal selected from the class consisting of cobalt and nickel which has the ilmenite-type crystal structure and is ferromagnetic.



2,770,524

## PRODUCTION OF PURE SODIUM CARBONATE FROM WYOMING TRONA

Max Y. Seaton and Robert D. Pike, Greenwich, Conn.; Kenneth R. Ray and The Stamford Trust Company, executors of said Robert D. Pike, deceased, said Seaton assignor to Food Machinery and Chemical Corporation, New York, N. Y., a corporation of Delaware

Application August 2, 1951, Serial No. 239,926
8 Claims. (Cl. 23—63)

1. In a cyclic process for producing soda ash of high purity from Wyoming trona, the steps comprising calcining trona at a temperature in excess of 500° C., dissolving the calcined trona in water and recycled mother liquor at about 50° C., filtering and substantially removing all of the organic coloring matter by an adsorbent producing a water white solution, separating the latter solution from the adsorbent, flowing the solution through a plurality of heating and evaporating zones in countercurrent flow to the passage of steam therethrough to a final heating zone having a pressure in excess of atmospheric and a solution temperature substantially in excess of 100° C. at which anhydrous sodium carbonate is the stable crystal phase, separating the formed crystals from the mother liquor, adding make-up water sufficient to maintain a constant amount of water in the system, recycling the mother liquor and added make-up water to again dissolve calcined trona at a substantially lower temperature than prevails in said last zone, calcining and drying the crystals of sodium carbonate to produce soda ash.

2,770,525

## PREPARATION OF ALKALI METAL CYANATES

Alfred Gordon Houpt, Stamford, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application March 3, 1954, Serial No. 413,957
11 Claims. (Cl. 23—79)

1. In a method for preparing an alkali cyanate, the steps which comprise: fusing at temperatures in excess of 550° C. a mixture of an organic nitrogen compound and an alkali metal carbonate in a titanium vessel for a period of less than thirty minutes and recovering an alkali cyanate of low cyanide content therefrom.

2,770,526

## METHOD FOR PURIFYING METAL HALIDES

Horace N. Lander, Topsfield, Mass., assignor to Metal Hydrides Incorporated, Beverly, Mass., a corporation of Massachusetts

No Drawing. Application December 19, 1955, Serial No. 553,704
3 Claims. (Cl. 23—99)

1. The method of treating impure calcium chloride to remove impurities which comprises heating the calcium chloride to render it anhydrous, and then heating the anhydrous material for at least about 1 to 4 hours at a temperature between about 425° C. and 650° C. in intimate contact with a gaseous medium consisting essentially of chlorine and carbon tetrachloride under a pressure slightly greater than one atmosphere, the minimum required ratio of chlorine to carbon tetrachloride by volume in the gaseous medium depending upon the temperature used and varying from a minimum ratio of about 1 to 2 at a temperature of about 425° C. to a minimum ratio of about 15.5 to 1 at a temperature of about 650° C.

2,770,527

## TERNARY FERROUS GROUP METAL SULFIDES OF MOLYBDENUM AND TUNGSTEN AND THEIR PREPARATION

Witt Lyde Alderson, Jr., and John T. Maynard, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 28, 1953, Serial No. 358,158
18 Claims. (Cl. 23—134)

1. A method for preparing ternary metal sulfides which comprises bringing hydrogen sulfide into contact with a mixture of a ferrous group metal sulfide and a sulfide of a non-ferrous metal selected from the class consisting of molybdenum and tungsten, said mixture being heated to a temperature between 500° and 1300° C. and the ratio of ferrous group metal sulfide to said non-ferrous metal sulfide in said mixture being from 1 to 2 gram moles of ferrous group metal sulfide per gram mole of non-ferrous metal sulfide.

9. A ternary ferrous group metal sulfide characterized by being a crystalline solid stable at temperatures within the range of 500° to 1300° C. and corresponding in chemical composition to the general formula $AMS_y$ wherein sulfur S is chemically combined with a ferrous group metal A and with a metal selected from the class consisting of molybdenum and tungsten in atomic ratio of y:1:1, y being 2.5 to 3.

2,770,528

## BARIUM FERROUS GROUP METAL TERNARY SULFIDES AND THEIR PREPARATION

John T. Maynard, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application March 15, 1954, Serial No. 416,437
13 Claims. (Cl. 23—134)

1. A barium ferrous group metal ternary sulfide conforming to the general formula $BaMS_x$ wherein M is a ferrous group metal, x is 2 to 2.5, and the ratio of barium to ferrous group metal is 1:1.

5. Process for preparing a barium ferrous group metal ternary sulfide which comprises sintering barium sulfide with a binary sulfide of a ferrous group metal at a temperature of 800° to 1400° C., in an atmosphere of hydrogen sulfide, and recovering as the resulting reaction product a barium ferrous group metal ternary sulfide wherein the ratio of barium to ferrous group metal is 1:1.

2,770,529

## METHOD FOR PREPARING CHLORINATION FEED MATERIAL

William W. Anderson, Metuchen, and Lancelot W. Rowe, Ferdo, N. J., assignors to National Lead Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application August 24, 1955, Serial No. 530,406
6 Claims. (Cl. 23—202)

1. A single stage process for preparing a chlorination feed material by directly converting the titanium values in a titaniferous iron material to a substantially iron-free titanium oxide material in the presence of a carbonaceous reducing agent which comprises: admixing a titaniferous iron material, a carbonaceous reducing agent and sulfuric acid to form a slurry; heating said slurry in a pressure vessel while maintaining the pressure within said vessel in the range of from about 100 p. s. i. to about 2000 p. s. i. for a period of time sufficient to solubilize the calcium, magnesium and iron constituents of said titaniferous material and precipitate the titanium values in the presence of the carbonaceous reducing agent in the form of a coalesced substantially iron-free relatively insoluble, hydrated titanium oxide-carbon material; said carbonaceous reducing agent being present in an amount of at least 20% based upon the amount of titanium dioxide in the titaniferous iron material; said sulfuric acid being present in an amount sufficient to solubilize substantially all of the calcium, magnesium and iron constituents in the titaniferous iron material; and thereafter separating said solubilized constituents and gangue from said insoluble hydrated titanium oxide-carbon material.

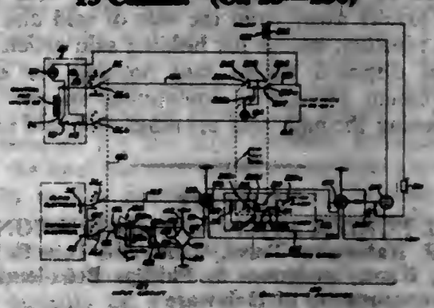
2,770,530

## METHOD OF OIL TESTING AND COMPOSITION THEREFOR

Roland F. Bergstrom, Martinez, Thomas S. Hodgson, Concord, and Harvey E. Hook, Danville, Calif., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application September 8, 1953, Serial No. 379,072
12 Claims. (Cl. 23—230)

4. An acid-base indicator composition which comprises from about 0.001 to about 0.002 mole of bromocresol green and from about 0.0002 to about 0.04 mole of 4-amino-1-naphthaleneazobenzene-4'-sulfonic acid per liter of a developer solution consisting essentially of from about 20% to about 40% by volume of aqueous ethanol containing from 0.5 to 20% by volume water based on said aqueous ethanol, from about 10% to about 30% by volume 4-methyl-2-pentanol, from about 0.1 to 1.5% by volume glycerol, from about 4% to about 70% by volume alpha-methylnaphthalene and from about 4 to about 50 percent by volume of a homogeneous solvent mixture which boils within the range of about 100° to about 400° F., and the aromatic content of which is from about 30% to about 70% by weight of said solvent mixture.



9. The method for determining the suitability of a used lubricating oil for further use in an internal combustion engine which comprises placing a small quantity of said oil in a thin essentially white porous medium, pouring over said small quantity of oil a solution of an organic acid-base indicator compound which exhibits a color change in the pH range of 3 to 6 in an essentially neutral developer solution comprising essentially from about 0.5 to about 20% by volume of water, at least 15% by volume of a monohydric alcohol and from about 4 to about 70% of a water immiscible oil-solvent, the concentration of said acid-base indicator compound in said developer solution being from about 0.0001 to about 0.05 gram moles of said indicator compound per liter of said developer solution.

2,770,531

## METHOD AND APPARATUS FOR AUTOMATIC TITRATION AND CONTROL OF VARIABLES

Roland C. Hawes, Los Angeles, and Allen Strickler, Burbank, Calif., assignors to Beckman Instruments, Inc., South Pasadena, Calif., a corporation of California

Application March 3, 1951, Serial No. 213,724
13 Claims. (Cl. 23—230)

12. An automatic titrator for bringing a batch of a sample solution to an end point by controlled addition of a reagent to such solution in measurable volume until a desired end point condition is reached, said automatic

titrator including in combination: means for developing an electric value which varies with the amount of said reagent added to said sample solution and which reaches a predetermined input value when the end point is reached; a valve in the path of flow of said reagent to said sample solution, said valve including an electric control means for shifting same substantially instantaneously between fixed positions, said positions being respectively an open and a closed position; an amplifier providing an input means and an output means; a relay having a control winding connected to said output means, said relay having first and second contact means actuatable upon change in energy level supplied to said control winding by said amplifier; means for operatively connecting one of said contact means to said electric control means of said valve to control the shifting of said valve between said positions in response to such change in energy supplied to said control winding; an RC circuit and means for operatively connecting same to the other of said contact means to produce a pulsing output varying in step with the shifting of said valve between said positions; and means for applying to said input means both the pulsing output of said RC circuit and a potential changing with changes in said electric value to repeatedly bring said amplifier prematurely to a valve-closing energy level until said pulsing output returns said amplifier to a valve-opening energy level, thus creating a series of closings and openings of said valve supplying increments of reagent of decreasing volume as said end point is approached.

**2,770,532**

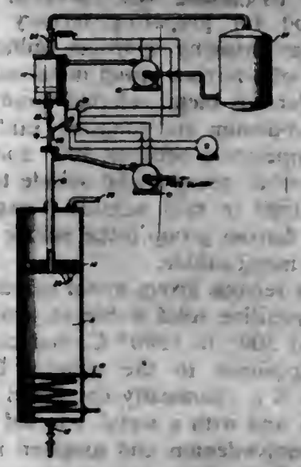
**DEVICE FOR REMOVING ARTICLES FROM AND INSERTING ARTICLES INTO PIPELINES**

John C. Mason, Bellflower, Calif.

Application July 6, 1953, Serial No. 366,691
6 Claims. (Cl. 23—253)

1. A device for removing and inserting an article through an aperture formed in a pipeline, comprising: a base disc, said base disc being formed with an opening that is aligned with said aperture means for mounting said base disc on said pipeline adjacent said aperture; a coaxial auxiliary disc rotatably mounted on said base disc adjacent thereto, said base disc being formed with an opening that is alignable with the opening in said base disc when said auxiliary disc is disposed in a first position, said auxiliary disc being rotatable to a second position wherein its opening is misaligned with the opening in said base disc whereby the latter is blocked; a fluid-tight housing mounted upon said auxiliary disc in line with the opening formed therein and in communication therewith, said housing extending axially away from the side of said disc remote from said pipeline; means for holding said article; and a mechanism disposed within said housing for effecting axial movement of said last-mentioned means relative to said housing through said openings and said aperture.

---



**2,770,533**

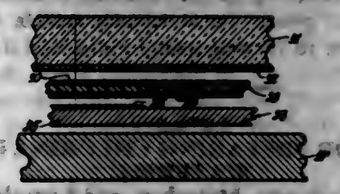
**CRYSTAL PURIFICATION APPARATUS CONTROL**

Anthony R. Kahmann, Tulsa, Okla., and Tom E. Martin, Topeka, Kans., assignors to Phillips Petroleum Company, a corporation of Delaware

Application December 1, 1952, Serial No. 323,390
12 Claims. (Cl. 23—273)

1. In an apparatus for the separation and purification of crystals comprising an elongated, closed vessel having a heater disposed in the downstream portion of said vessel with respect to the flow of crystals, a perforate, reciprocable piston disposed in the upstream portion of said vessel adapted to produce a longitudinal compression stroke, an outlet opening in the upstream portion and an outlet opening in the downstream portion the improvement comprising a crystal feed inlet positioned so as to introduce feed downstream from the downstream face of the piston with respect to the flow of crystals; means for supplying a slurry of crystals and mother liquor

to said inlet; means for imparting a longitudinal compression stroke to said piston downstream with respect to the flow of crystals; means actuated by the piston at the completion of the compression stroke to disengage the means for imparting the compression stroke and to engage the means for supplying the crystal slurry, and actuated by the piston at the opposite poistion of longitudinal reciprocation to engage the means for imparting the compression stroke and to disengage the means for supplying the crystal slurry.



---

**2,770,534**

**METHOD AND MATERIAL FOR MAKING OVERLAY MASKS**

Walter S. Marx, Jr., Santa Barbara, Calif., assignor to Printing Arts Research Laboratories, Inc., Santa Barbara, Calif., a corporation of Delaware

Application May 10, 1953, Serial No. 356,285
9 Claims. (Cl. 41—41)

1. The method of making an overlay mask on a base sheet of transparent or translucent material and of a type adapted for use in the production of relief halftone and lithographic plates from art copy having tone and other areas, which method comprises the steps of applying to the base sheet a surface exposed layer of a color-changeable substance, distinguishing between the tone and other areas of the art copy by the inclusion in one of said areas of a normally inert substance which is stationary at normal room temperature and so sensitive to mild heat at an elevated temperature that a gaseous reagent is generated from said substance, which reagent is chemically reactive in its gaseous form with said color-changeable substance to effect a change of the color thereof, placing the base sheet upon the art copy with the color-changeable substance in contact with said areas thereof, and heating the contacting surfaces from its normal room temperature to a reagent-generating temperature for said inert substance for a limited period of time to effect the color change of the color-changeable substance.

**2,770,535**

**STABILIZED ORGANIC COMPOSITIONS**

Eugene F. Hill, Birmingham, and David O. De Prue, Royal Oak, Mich., assignors to Ethyl Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 11, 1952, Serial No. 325,453
8 Claims. (Cl. 44—69)

3. A new composition consisting essentially of a non-olefinic petroleum hydrocarbon motor fuel for internal combustion engines, and an alkyllead anti-knock agent, and, in an amount sufficient to prevent premature decomposition of the alkyllead, a material having the general formula

wherein $R_1$ is selected from the group consisting of alkyl, cycloalkyl, aryl and substituted aryl, said substituted aryl containing a radical selected from the group consisting of hydroxy, amino and alkylamino, $R_3$ and $R_4$ are selected from the group consisting of hydrogen, alkyl, cycloalkyl, aryl, aralkyl and alkaryl, A is selected from the group consisting of hydroxy, amino and hydrocarbon derivatives thereof, and X is selected from the group consisting of oxygen and sulfur.

**2,770,536**

**METHOD FOR GASIFICATION OF SOLID FUELS**

Scott W. Walker, Tulsa, Okla., assignor to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

Application December 30, 1950, Serial No. 203,574
10 Claims. (Cl. 48—206)

10. A method for producing valuable gaseous products from solid carbonaceous fuel which includes mixing particles of said fuel with steam which is under pressure, injecting said particles into a combustion zone maintained at a temperature of from about 2200° to about 3500° F., admixing and reacting free oxygen therewith in said zone to produce molten slag, partially burned fuel particles, and a gaseous mixture comprising CO and $CO_2$, the injecting being effected at such velocity and at such elevation above the floor of the zone that the particles of fuel and molten slag follow an arcuate path, due to the action of gravity, terminating at the floor of said zone short of the boundary of said zone toward which injection is effected, forming at the bottom of said zone a horizontal quiescent bed of molten slag having on the surface thereof partially burned fuel articles, and thereafter allowing the latter to react with $CO_2$ in said gaseous mixture to produce additional quantities of CO.

**2,770,537**

**N-1-NAPHTHYLPHTHALAMIC ACID HERBICIDAL COMPOSITIONS**

Allen E. Smith, Oxford, Albert W. Feldmann, North Haven, and Gracie M. Shaw, Naugatuck, Conn., assignors to United States Rubber Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application October 27, 1954, Serial No. 465,151
11 Claims. (Cl. 71—2.4)

8. The method of controlling weeds in soil which comprises treating the soil before emergence of weeds with a phytotoxic amount of N-1-naphthylphthalamic acid, and material selected from the group consisting of sulfuric, hydrochloric, nitric and phosphoric acids, and alkali bisulfates in proportion sufficient to reduce leaching in the soil of said N-1-naphthylphthalamic acid, and in the absence of any added basic material capable of reacting with such acidic inorganic chemical to neutralize it.

---

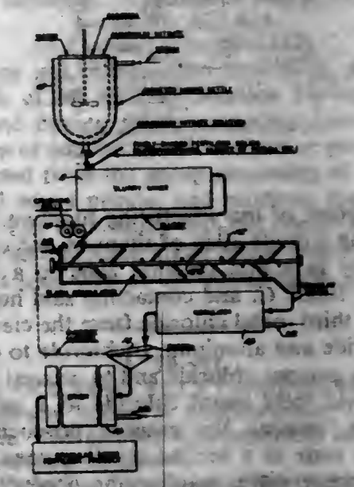
**2,770,538**

**LIQUID FERTILIZERS**

Donald E. Vierling, Pittsburgh, Pa.

No Drawing. Application August 11, 1954, Serial No. 449,247
2 Claims. (Cl. 71—29)

1. The method of manufacturing a liquid fertilizer which comprises adding to water sufficient potassium hydroxide to obtain the desired percentage of potassium oxide, adding sufficient phosphoric acid to obtain the desired percentage of phosphorous pentoxide, neutralizing the phosphoric acid with ammonia and adding sufficient urea to provide the desired amount of organic nitrogen, said organic nitrogen avoiding fast assimilation of nitrogen.



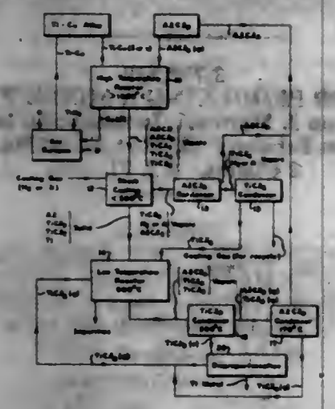
---

**2,770,539**

**PROCESS FOR PRODUCING A MIXED FERTILIZER**

Simon J. Martenet, Indianapolis, Ind.

Application February 15, 1954, Serial No. 410,247
2 Claims. (Cl. 71—36)

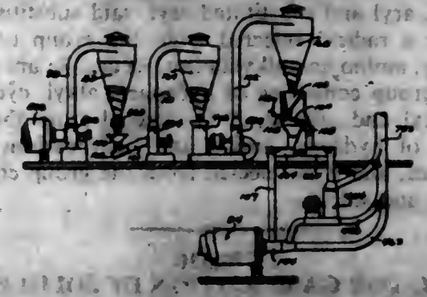


1. The continuous process of making a substantially non-hydroscopic mixed fertilizer of particulate form with a final water content as low as one percent with a high nitrogen content derived primarily from ammonium nitrate wherein each discreet particle of the fertilizer product has individually an analysis substantially the same as that of the overall fertilizer, which process comprises intermixing and agitating quickly into a thin watery slurry, a dry, finely divided phosphate material selected from superphosphate and triple superphosphate, and a water solution of ammonium nitrate in a concentration selected for the final fertilizer nitrogen content wherein the total quantity of the ammonium nitrate ranges from 300 to 800 pounds per ton of finished fertilizer and the temperature of the slurry is maintained above the ammonium nitrate salting out temperature ranging upwardly from an approximate minimum of 130 degrees F., the quantity of water in said solution ranging upwardly from approximately 150 pound per ton of finished fertilizer, agitating the slurry and simultaneously cooling it to below said salting out temperature resulting in quick solidification; and continuing the agitation to bring the solidifying product into particulate form.

2,770,540
LIQUID FERTILIZERS
Donald E. Vierling, Pittsburgh, Pa.
No Drawing. Application June 19, 1953, Serial No. 362,943
2 Claims. (Cl. 71—43)

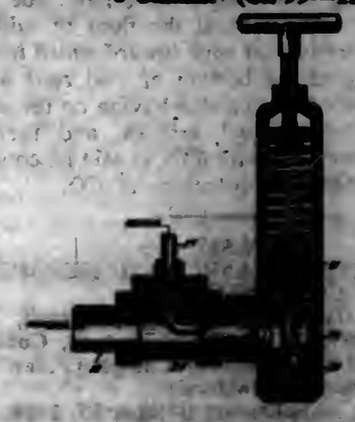
1. The method of manufacturing a liquid fertilizer which includes adding to water sufficient potassium hydroxide to obtain the desired percentage of potassium oxide, neutralizing the potassium hydroxide with nitric acid, adding sufficient phosphoric acid to obtain the desired percentage of phosphoric pentoxide, neutralizing the phosphoric acid with ammonia, and adding equal molecular weights of ammonia and nitric acid to obtain the desired percentage of nitrogen.

2,770,541
METHOD OF PRODUCING TITANIUM
Richard H. Singleton, Lexington, Mass., assignor to National Research Corporation, Cambridge, Mass., a corporation of Massachusetts
Application August 14, 1952, Serial No. 304,388
9 Claims. (Cl. 75—84.5)



2. The process of manufacturing titanium which comprises forming a crude alloy of titanium and copper, heating said alloy in a first reaction zone to a temperature above about 1000° C. and contacting said hot alloy with a vapor of a third metal chloride from the class consisting of zinc chloride and aluminum trichloride to convert said titanium to a gaseous chloride and to convert the metallic portion of said third metal chloride to a gaseous lower valence state, passing the gaseous products from the first reaction zone to a second reaction zone maintained at a lower temperature, reacting the products from said first zone with titanium tetrachloride in said second zone to form titanium trichloride and said chloride of said third metal, separating said titanium trichloride from the reaction mass and by-products, disproportionating said titanium trichloride to titanium metal and titanium tetrachloride, and recycling said titanium tetrachloride to said second zone to increase the production of titanium trichloride therein.

2,770,542
COLOUR PHOTOGRAPHY
Gordon H. Burt, Wellington, New Zealand, assignor to Tru Colour Film Limited, Wellington, New Zealand, a company of New Zealand
No Drawing. Application September 2, 1952, Serial No. 307,567
Claims priority, application Great Britain August 31, 1951
10 Claims. (Cl. 95—88)



1. In a photographic process for producing a positive colour image comprising forming a substantially insoluble silver bromide-amide-acid dyestuff complex by treating silver bromide containing bleached silver image with an aqueous bath containing a substance selected from the group consisting of water-soluble thioamides and selenoamides and with an aqueous bath containing an acid dyestuff and thereafter transferring the dyestuff component of said complex to a permanent base, the improvement in the step of forming said complex which comprises treating said bleached image with an aqueous bath containing (*a*) a low concentration of said amide (*b*) an acid dyestuff and (*c*) a water-soluble bromide salt, whereby said complex is formed in amounts in substantial linear proportionality to the silver present in said bleached image.

2,770,543
RECIRCULATING CONVECTION CURRENT COOLER AND METHOD
Gerald D. Arnold and Alexander A. Arnold, Wauwatosa, Wis.; said Alexander A. Arnold assignor to Gerald D. Arnold
Application November 24, 1950, Serial No. 197,266
12 Claims. (Cl. 99—2)

1. A method of refrigerating solids in a stream of gas containing moisture, said method comprising circulating gases in a closed circuit, delivering the solids to be cooled into said circuit at one point for advance therein by the circulating gases, separating the solids from the circulating gases and discharging the solids from another point in the circuit, and passing both the gases and solids over refrigerating heat exchange surfaces at a point intermediate the point of admission and the point of discharge of the solids at scouring speeds whereby the impact of said solids against said surfaces scours said surface and prevents accumulation of liquids or solids thereon, said refrigerating heat exchange surfaces being cooled to the point where condensation of the moisture in said gas would otherwise hold and accumulate solids on said surfaces.

2,770,544
CONTINUOUS METHOD OF MIXING
Ogden Johnson, Bronxville, N. Y., assignor to Ford, Bacon & Davis, Inc., New York, N. Y., a corporation of New Jersey
Application January 11, 1952, Serial No. 265,959
8 Claims. (Cl. 99—123)

1. A method of intimately and continuously admixing an additive with a stream of base material which comprises continuously advancing the stream of base material under a superatmospheric pressure of at least 300 p. s. i., continuously injecting, at a pressure at least equal to the pressure of the stream of base material, a stream of said additive into the stream of base material, and immediately thereafter releasing the combined streams of base material and additive from said superatmospheric pressure to accelerate the rate of flow of the combined streams and provide a high degree of turbulence to intimately mix the materials.

2,770,545
STABILIZATION OF ORGANIC COMPOUNDS
Ralph B. Thompson, Hinsdale, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
No Drawing. Application October 2, 1953, Serial No. 383,937
20 Claims. (Cl. 99—163)

1. Method of stabilizing an organic material against oxidative deterioration which comprises incorporating therein a purpurogallin compound.

2,770,546
METAL DEACTIVATORS
Ralph B. Thompson, Hinsdale, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
No Drawing. Application February 26, 1954, Serial No. 412,988
18 Claims. (Cl. 99—163)

1. A method of stabilizing an organic substance against oxidative deterioration catalyzed by a metal constituent which comprises incorporating in said organic substance a tropolone compound.

2,770,547
SOFT PLASTIC FOOD PACKAGE
Leo Peters, Grand Rapids, Mich.
Application August 16, 1954, Serial No. 450,188
7 Claims. (Cl. 99—171)

1. A soft plastic food package, comprising an open-ended tubular container having walls formed of an unbacked sheet of thermoplastic material having a thickness of from .008 to .03 inch and being provided with an indented decorative design, said thermoplastic sheet walls being unsupported externally, a soft plastic food body within said container having outer surfaces conforming to said thermoplastic sheet walls and bearing the impression of said decorative design, and closures for the ends of said container, said thermoplastic sheet walls being resiliently shape-restoring when deformed in local areas while being bendable through an arc of 180° without forming a crease at said arc.

2,770,548
MEAT-CURING SALT COMPOSITION
Lloyd A. Hall and Walter S. Kalchbrenner, Chicago, Ill., assignors to The Griffith Laboratories, Inc., Chicago, Ill., a corporation of Illinois
No Drawing. Application July 1, 1955, Serial No. 519,615
14 Claims. (Cl. 99—222)

1. A curing salt composition consisting of the flash-dried crystals of an aqueous solution having a pH not under 7.4 and having solute consisting essentially of a major portion of sodium chloride, a minor portion of curing salt selected from the group consisting of alkali metal nitrite, alkali metal nitrate, and mixtures thereof, and a small quantity of anti-caking material comprising a hygroscopic agent, a small quantity of alkaline alkali metal orthophosphate, and a small quantity of alkali metal citrate.

2,770,549
MEAT-CURING SALT COMPOSITION
Lloyd A. Hall, Chicago, Ill., assignor to The Griffith Laboratories, Inc., Chicago, Ill., a corporation of Illinois
No Drawing. Application July 1, 1955, Serial No. 519,617
10 Claims. (Cl. 99—222)

1. A curing salt composition consisting of the flash-dried crystals of an aqueous solution having a pH not under 7.4 and having solute consisting essentially of a major portion of sodium chloride, a minor portion of curing salt selected from the group consisting of alkali metal nitrite, alkali metal nitrate, and mixtures thereof, and a small quantity of anti-caking material comprising a hygroscopic agent and at least 0.5% by weight of alkali metal tartrate calculated as sodium tartrate dihydrate.

2,770,550
MEAT-CURING SALT COMPOSITION
Lloyd A. Hall and Carroll L. Griffith, Chicago, Ill., assignors to The Griffith Laboratories, Inc., Chicago, Ill., a corporation of Illinois
No Drawing. Application July 1, 1955, Serial No. 519,614
14 Claims. (Cl. 99—222)

1. A curing salt composition consisting of the flash-dried crystals of an aqueous solution having a pH not under 7.4 and having solute consisting essentially of a major portion of sodium chloride, a minor portion of curing salt selected from the group consisting of alkali metal nitrite, alkali metal nitrate, and mixtures thereof, and a small quantity of anti-caking material comprising a hygroscopic agent and alkaline alkali metal orthophosphate in amount in at least 2% of the composition, calculated as $NaPO_4 \cdot H_2O$.

2,770,551
MEAT-CURING SALT COMPOSITION
Lloyd A. Hall and Walter S. Kalchbrenner, Chicago, Ill., assignors to The Griffith Laboratories, Inc., Chicago, Ill., a corporation of Illinois
No Drawing. Application July 1, 1955, Serial No. 519,616
10 Claims. (Cl. 99—222)

1. A curing salt composition consisting of the flash-dried crystals of an aqueous solution having a pH not under 7.4 and having solute consisting essentially of a major portion of sodium chloride, a minor portion of curing salt selected from the group consisting of alkali metal nitrite, alkali metal nitrate, and mixtures thereof, and a small quantity of anti-caking material comprising a hygroscopic agent and at least 0.5% by weight of alkali metal citrate calculated as sodium citrate dihydrate.

2,770,552
PROCESS OF MAKING REFRACTORY MATERIAL
Arthur O. Fleger, Brighton, N. Y., assignor to Henry Industrial Ceramic Corporation, New Haven, Conn., a corporation of New York
No Drawing. Application March 11, 1953, Serial No. 341,819
1 Claim. (Cl. 106—44)

The process of making refractory material which consists in mixing about 17.5% to 25% by weight of silicon carbide having a fineness of 46 mesh with about 75%

to 82.5% by weight of alumina, said volume of alumina being made up of 58% by weight having a fineness of —6+60 mesh, 32% by weight having a fineness of —60+325 mesh, and 10% by weight having a fineness of —325 mesh, adding to said mix 320 grams of a lignin derivative and water in the proportions of 2 oz. of water to 4 pounds of the alumina, silicon carbide and lignin derivative mix, and thereafter forming, drying for five hours at a temperature of 400° F., and firing the material from room temperature to 3000° F. over a period of 16 hours.

---

2,770,553
SOFT GELATIN ENCAPSULATION
Joseph Francis Waldenheimer, Orangeburg, and Francis Marc Callahan, South Nyack, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application September 9, 1952, Serial No. 308,713
3 Claims. (Cl. 106—136)

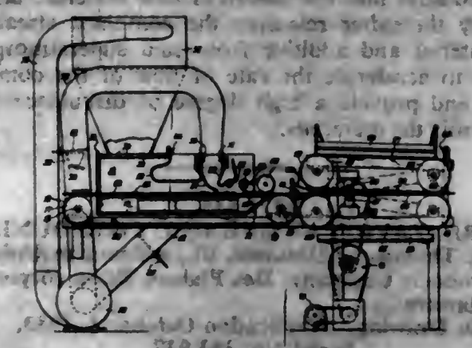
3. A soft gelatin capsule comprising a shell formed by casting a composition comprising essentially gelatin 48 to 56 parts, glycerin 12 to 18 parts, water 30 to 34 parts and a plasticizer selected from the group consisting of formamide and acetamide 2 to 6 parts and capsule contents in said shell.

---

2,770,554
VISCOSE SOLUTION, A PROCESS FOR MAKING IT AND A FILAMENT FORMED FROM IT
William B. Miller, Edward H. Shaw, and Hoyt Little, Rome, Ga., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware
No Drawing. Application November 3, 1952, Serial No. 319,604
18 Claims. (Cl. 106—165)

12. A viscose solution containing a sodium aldohexonate in an amount sufficient to improve its clarity.

---



2,770,555
CELLULOSE COMPOUND FILM-FORMING COMPOSITION AND A REGENERATED CELLULOSE FILM COATED THEREWITH
Ralph T. K. Cornwell, Rossmont, Pa., assignor to American Viscose Corporation, Wilmington, Del., a corporation of Delaware
No Drawing. Application June 7, 1951, Serial No. 230,444
19 Claims. (Cl. 106—173)

1. A composition of matter comprising a film-forming material consisting of a substance selected from the group consisting of organic solvent-soluble cellulose ethers, cellulose esters, mixed cellulose esters and cellulose ether-esters and tricyclohexyl phosphate.

---

2,770,556
METHOD OF PATCHING AN OPENING IN A PLANE MEMBER
Donald H. Grangaard, Appleton, and Arthur W. Plummer, Neenah, Wis., assignors, by mesne assignments, to Kimberly-Clark Corporation, a corporation of Delaware
Application January 22, 1953, Serial No. 332,694
3 Claims. (Cl. 117—2)

1. The method of patching an opening extending through a generally plane member, which comprises providing a constantly flowing gaseous stream containing comminuted solid filler particles, supporting said plane member on a foraminous member in a position generally parallel to the direction of flow of the gaseous stream and in surface contact with the constantly flowing gaseous stream, said foraminous member being disposed on the side of said plane member opposite that which is in contact with said gaseous stream, and providing suction on the side of said plane member opposite the gaseous stream, thereby drawing filler particles from the stream only into

said opening through said plane member and filling said opening at least to the level of the opposite surfaces of said plane member.

---

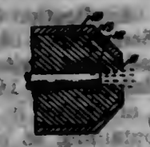
2,770,557
CATHODE RAY TUBE SCREEN FILMING BY A FLOW METHOD
Eros Atti, Elmira, N. Y., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 5, 1954, Serial No. 402,207
21 Claims. (Cl. 117—33.5)

1. The method of filming a water wetted phosphor screen within a bulb of a cathode ray tube with lacquer, said bulb having a face plate and a neck portion, which comprises placing a quantity of liquid lacquer within the bulb, tilting the bulb so that its faceplate is downwards and the axis of its neck is at an angle to the vertical, and slowly rotating the bulb about the axis of its neck at a speed below that at which the centrifugal force would have an appreciable effect on said lacquer so that the lacquer flows in a spiral path over the surface of the screen.

---

2,770,558
METHOD OF PRODUCING MIRRORS
Roney A. Gaiser, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application December 13, 1952, Serial No. 325,829
1 Claim. (Cl. 117—35)

A method of producing a mirror including a mirror plate of vitreous material and a reflecting coating on a surface thereof, comprising heating said plate to a temperature between approximately 750° F. and a point below the softening point of the vitreous material, spraying the heated plate with a solution consisting essentially of from 1 to 50 parts of a tin compound and from 19 to 50 parts of alcohol until a clear transparent reflective but substantially colorless film of a tin oxide in a thickness of an odd multiple of a quarter wave length of visible light having a wave length of approximately 5600 Angstrom units is formed on a surface thereof, and discontinuing the spray before a noticeable fog or objectionable color appears.



2,770,559
HEAT SEALING LACQUER COATED FILM AND METHOD OF PRODUCING SAME
William Basil Herbeck, Irvington, N. J., assignor to Celanese Corporation of America, New York, N. Y., a corporation of Delaware
No Drawing. Application February 23, 1954, Serial No. 412,060
17 Claims. (Cl. 117—76)

1. An organic acid ester of cellulose film coated with a member of the class consisting of di-(alkoxymethyl)-ethylene ureas and thioureas and having applied to said coating a heat-sealing lacquer.

---

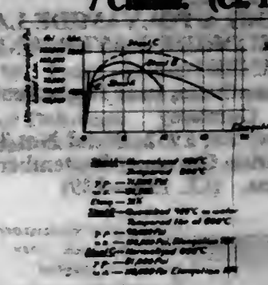
2,770,560
METHOD OF EMPLACING MORTAR
Lloyd H. Holmes, Lemont, Ill., assignor to E-Z-On Corporation, Chicago, Ill., a corporation of Illinois
Application July 27, 1954, Serial No. 446,133
8 Claims. (Cl. 117—104)

1. The method of emplacing an aqueous mortar mix comprising mixing with an aggregate and cementitious material having a low water content which renders it non-flowable, an air-entraining agent to form air bubbles in the mixture and to render the mixture flowable, conveying the aerated mixture within an enclosed conduit to a point adjacent the place of application, and discharging the mixture upon said place of application while disrupting the bulk of the air bubbles to release the air therefrom at about the point of discharge.

---

2,770,561
PHOTOELECTRIC CATHODE AND METHOD OF PRODUCING SAME
Alfred H. Sommer, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application March 8, 1954, Serial No. 414,563
14 Claims. (Cl. 117—211)

8. The method of forming a photosensitive electrode on a support member, said method comprising the steps of forming a film of antimony on said support member, sensitizing said antimony film by depositing thereon a plurality of alkali metals, and subsequently baking said film at an elevated temperature.

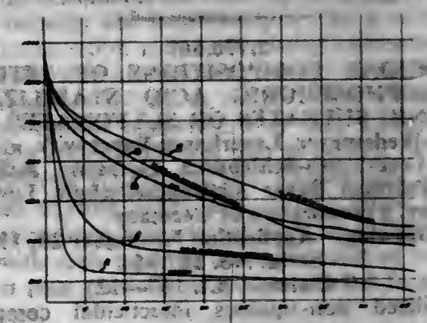


---

2,770,562
METHOD OF PRODUCING NON-CRYSTALLIZING HYDROL
Walter R. Fetzer, Clinton, Iowa, assignor, by mesne assignments, to Standard Brands Incorporated, New York, N. Y., a corporation of Delaware
No Drawing. Application May 3, 1954, Serial No. 427,248
4 Claims. (Cl. 127—34)

1. A method of rendering corn sugar hydrol non-crystallizing comprising heating the hydrol to a temperature between 160° and 230° F. and admixing it with ammonia in such an amount that the ammonia constitutes between 0.5% and 1.0% of the dry basis weight of the hydrol, continuing the reaction under the heat treatment for at least 10 minutes and terminating the reaction by cooling of the mixture to limit the reaction to not more than 30 minutes.

---

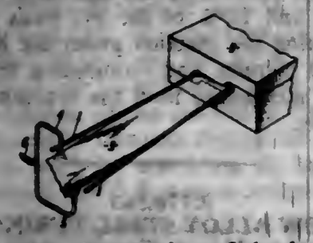


2,770,563
LOW ALLOY STEEL TUBING
Eugene M. Herzog, Nancy, France, assignor to Acieries de Pompey, Paris, France, a corporation of France
Application June 10, 1953, Serial No. 360,677
Claims priority, application France March 7, 1953
7 Claims. (Cl. 148—31)

1. Rolled steel steel tubing made of an alloy steel having substantially the following composition 0.08–0.2% carbon, 0.3–1.2% manganese, 0.6–5% chromium, 0.1–0.5% silicon, 0.15–0.6% aluminum, up to 0.5% molybdenum and the balance iron, said tubing being subjected to a heat treatment comprising a normalizing heating and cooling or quenching following by an annealing conferring to it a microstructure consisting of ferrite grains and uniformly dispersed carbides.

---

2,770,564
METHOD OF QUENCHING METALS
Mack Gordon, Cleveland, Ohio
Application July 6, 1954, Serial No. 441,482
9 Claims. (Cl. 148—13.1)



1. The method of quenching quench-hardenable steel in an austenitic condition from above the austenite transformation range to below the $M_S$ temperature to produce hardening, comprising immering it in a solution of a soluble gum in water.

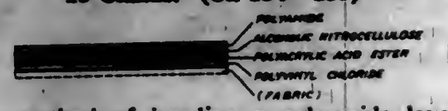
---

2,770,565
HUMIDIFYING PROCESS IN ELECTRIC CABLE INSULATION MAKING
Sidney Wilfred Ferguson and Leslie Frank Cowan, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application June 15, 1953, Serial No. 361,768
Claims priority, application Great Britain June 23, 1952
8 Claims. (Cl. 154—2.24)

3. A method of insulating an electric conductor by applying a strip of paper therearound, comprising subjecting substantially the complete paper strip to a humidifying process to impart a controlled moisture content

thereto, longitudinally folding said moistened strip of paper around said conductor, and heating said paper

sufficiently so that the reaction of the heat and moisture sets the paper in its folded position.



---

2,770,566

**METHOD OF BONDING A POLYAMIDE LAYER TO A POLYVINYL CHLORIDE LAYER AND PRODUCTS THUS OBTAINED**

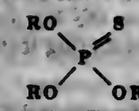
Franz Ritter, Grossostheim, near Aschaffenburg, Germany

Application September 24, 1952, Serial No. 311,323
Claims priority, application Germany September 29, 1951
15 Claims. (Cl. 154—139)

1. The method of bonding a polyamide layer to a polyvinyl chloride layer which comprises depositing on the polyvinyl chloride layer a first intermediate layer of a solution of a substance selected from the group consisting of a polyacrylic acid ester and a polymethacrylic acid ester, depositing on said first intermediate layer a second intermediate layer of a substance selected from the group consisting of nitrocellulose and polyvinyl acetate, and depositing on said second intermediate layer the polyamide layer.

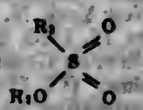
11. Artificial material comprising, as a basic layer, a layer of polyvinyl chloride, on said basic layer an intermediate layer of a substance selected from the group consisting of a polyacrylic acid ester and a polymethacrylic acid ester and on said intermediate layer a layer consisting of a mixture of nitrocellulose and the polyamide.

---



2,770,567

**INSECTICIDAL COMPOSITIONS OF ESTERS OF THIONOPHOSPHORIC ACID STABILIZED BY ORGANIC SULFATES OR SULFONATES**



Karlfried Wedemeyer, Leverkusen-Bayerwerk, and Detlef Delfs, Leverkusen-Schlebusch, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Application November 23, 1951, Serial No. 257,964
7 Claims. (Cl. 167—22)

1. Stabilized non-aqueous insecticidal compositions containing as an active ingredient an insecticidal neutral ester of thionophosphoric acid of the following general formula:

wherein R stands for lower alkyl and $R_1$ for a member of the group consisting of β-ethylmercapto lower alkyl and p-nitrophenyl, and as a stabilizer about 0.5 to about 20 mol percent, based on the number of mols of active ingredient of a compound having the following general formula:

wherein $R_2$ stands for lower alkyl, and $R_3$ is a member selected from the group consisting of lower alkyl, O-lower alkyl and tolyl.

---

2,770,568

**P-CHLOROBENZYL P-CHLOROPHENYL SULFIDE AND ACARICIDAL COMPOSITIONS CONTAINING THE SAME**

Douglas Greenwood, Mansfield, Nottingham, and Herbert Aubrey Stevenson, Clifton, Nottingham, England, assignors to Boots Pure Drug Company Limited, Nottingham, England, a British company

No Drawing. Application March 9, 1953, Serial No. 341,342
Claims priority, application Great Britain March 17, 1952
7 Claims. (Cl. 167—30)

2. An acaricidal composition comprising p-chlorobenzyl-p-chlorophenyl sulfide and a carrier.

---

2,770,569

**ANALGESIC COMPOSITIONS**

Konrad Frankenberg, André Grossmann, Béla Pullmann, and Otto Schnider, Basel, Switzerland, assignors to Hoffmann-La Roche Inc., Nutley, N. J., a corporation of New Jersey

No Drawing. Application October 15, 1952, Serial No. 314,954
Claims priority, application Switzerland August 1, 1952
6 Claims. (Cl. 167—65)

4. A composition of matter in a form for administration by injection containing as essential therapeutic ingredients morphine-type analgesic material and antagonist material selected from the group consisting of levo-3-hydroxy-N-allyl-morphinan and its acid addition salts, the effective content of levo-3-hydroxy-N-allyl-morphinan in said composition being from about 0.5 percent to about 10 percent by weight of said analgesic material.

---

2,770,570

**METHOD OF OBTAINING INTRINSIC FACTOR PREPARATIONS OF ENHANCED POTENCY**

Kenneth C. Robbins, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois

No Drawing. Application September 18, 1952, Serial No. 310,372
3 Claims. (Cl. 167—74)

1. In a process for preparing an intrinsic factor preparation of enhanced potency, the sequence of steps comprising extracting intrinsic factor-bearing tissue selected from the group consisting of hog stomach tissue and hog duodenum tissue with water at an acidic pH between 2.0 and 4.0 to obtain an intrinsic factor extract, adjusting the pH of said extract to a pH from 4.5 to 5.0 to form a precipitate of relatively low intrinsic factor potency, separating the precipitate from the supernatant, and fractionating said supernatant to obtain a precipitate of enhanced intrinsic factor potency, said fractionating step being carried out by adding an alcohol to said supernatant until the alcohol concentration thereof is from 30 to 50% by volume while maintaining the pH of said extract within the range from pH 4.0 to 6.0, said alcohol being selected from the group consisting of methanol and ethanol.

---

2,770,571

**SOFT GELATIN CAPSULE PROVIDED WITH INTERNAL BARRIER**

John James Vance, Park Ridge, N. J., and Ernest Chu Yen, Pearl River, N. Y., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application August 17, 1953, Serial No. 374,530
1 Claim. (Cl. 167—82)

A soft gelatin capsule comprising a gelatin composition film and on the inner surface thereof a smooth continuous inert coating of a beta-pinene polymer from about .00005 to .0005 inch thick, whereby the gelatin composition is protected from deleterious interaction with the capsule contents.

2,770,572

**BLOOD GROUPING CARD**

Knud-Erik Harboe Eldon, Hellerup, Denmark, assignor to Nordisk Insulinlaboratorium, Gentofte, Denmark, a firm

Application July 24, 1952, Serial No. 300,698
Claims priority, application Denmark July 28, 1951
10 Claims. (Cl. 167—84.5)

1. Means for blood grouping comprising a solid sheet having at least one surface area carrying the dried residue of a mixture of a dextrane solution and a serum containing a specific agglutinin against human blood cells, the proportion of dried serum residue to that of dried solution residue being one such as would result from drying a mixture of the serum and a six percent dextrane solution having a composition between about one percent serum and about twenty percent serum.

---

2,770,573

**ENZYMATIC SYNTHESIS OF N-ACETYLGLUCOSAMINIDO GALACTOSE AND GALACTOSIDO-N-ACETYL GLUCOSAMINE**

Paul György, Villanova, and Friedrich Zilliken, Philadelphia, Pa., assignors to American Home Products Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 10, 1953, Serial No. 397,469
4 Claims. (Cl. 195—28)

1. The process of preparing a mixture containing N-acetyl-glucosaminido galactose and galactosido-N-acetyl glucosamine, said mixture having high activity for promoting the growth of *Lactobacillus bifidus* var. Penn, A. T. C. C. No. 11,863, which comprises reacting lactose and N-acetyl-d-glucosamine in the presence of an enzyme present in growing cultures of said *Lactobacillus bifidus* var. Penn microorganism and secured therefrom by centrifuging a growing culture of said microorganism in order that said enzyme may be separated therefrom, lyophilizing the separated solid product, and intimately mixing the dry product resulting with aluminum oxide in the presence of a phosphate buffer solution, thereby securing a solution of said enzyme.

---

2,770,574

**SELECTIVE ENRICHMENT MEDIUM FOR SALMONELLA**

Jacob L. Stokes, El Cerrito, and William W. Osborne, Richmond, Calif., assignors to the United States of America as represented by the Secretary of Agriculture

No Drawing. Application June 24, 1955, Serial No. 517,950
9 Claims. (Cl. 195—100)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A medium which stimulates the growth of Salmonella and suppresses the growth of other microorganisms comprising water, nutritive materials, and the following ingredients in the approximate concentrations set forth below:

| | | |
|---|---|---|
| Alkali-metal selenite | percent | 0.1 to 1.0 |
| Brilliant green | ppm | 1 to 20 |
| At least one member of the group consisting of taurocholic acid, desoxycholic acids and the salts thereof | percent | 0.05 to 1 |

---

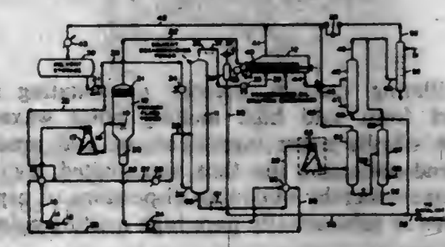
**PRODUCTION OF BACTERIAL ENZYME PREPARATIONS AND THE CULTIVATION OF MICRO-ORGANISM OF INDUSTRIAL AND NUTRITIONAL VALUE**

Donald Herbert Frank Clayton, Stanmore, England, assignor to J. Lyons & Company Limited, London, England, a British company

Application February 11, 1952, Serial No. 270,974
9 Claims. (Cl. 195—116)

1. A method of preparing a spongy, absorbent, porous substrate for use as a microbial culture medium which comprises making a dough comprising a farinaceous material, nutrients for the microbes to be cultured, and a leavening agent, followed by heating to form said substrate.



---

2,770,576

**PREPARATION OF CATALYTIC CRACKING FEED**

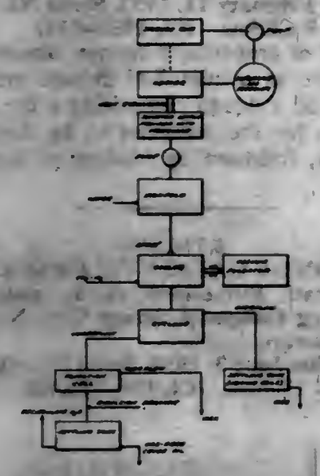
Thomas W. Pratt, Rutherford, N. J., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

Application June 3, 1954, Serial No. 434,181
4 Claims. (Cl. 196—14.46)

1. A method for preparing a charge oil for catalytic cracking, which includes the steps of: heating an atmospheric reduced crude and introducing it into a vacuum flashing tower at a temperature sufficiently high to maintain within said tower a flashing temperature within the range of about 100° F. below that at which substantial thermal decomposition begins to take place; withdrawing from said tower a vacuum bottoms containing at least 25% of the oil suitable for catalytic cracking; cooling said vacuum bottoms and introducing it into a vertically extended fractionation zone and counter-currently contacting it therein with an upflowing stream of normally gaseous hydrocarbon solvent at temperatures within 100° F. below the critical temperature of said solvent to fractionate said vacuum bottoms into an asphalt raffinate and a decarbonized oil extract; and withdrawing hot vapors from said flashing tower and extract phase from said fractionation zone and passing them in indirect heat exchange with each other to condense most of said vapors and to at least partially evaporate solvent from said extract phase.

---

2,770,577



**PROCESS OF SEPARATING MICROCRYSTALLINE WAXES FROM CRUDE OIL**

Ernest Stossel, San Francisco, Calif.

Application July 11, 1952, Serial No. 298,305
5 Claims. (Cl. 196—18)

1. A process of separating high melting point waxes from crude oil containing the same and also containing resinous and asphaltic ingredients, comprising the steps of heating said crude oil at a predetermined temperature above the solvation temperature of said waxes in said oil which reduces to an optimum degree the pour point and viscosity of said crude oil so as to stabilize the colloidal systems in said crude oil by temporarily reducing the pour point and viscosity to an optimum degree and converting said crude oil to a homogeneous oil-in-water emulsion, thereby forming a homogeneous stabilized oil-in-water emulsion; cooling said homogeneous

stabilized oil-in-water emulsion in an oscillating vacuum during the optimum pour point and viscosity hysteresis period until precipitation of said high melting point waxes from said emulsion so as to cool said emulsion and disintegrate the same while further reducing the pour point of said crude oil by shaking action of

the oscillating vacuum, thereby precipitating in finely dispersed form said high melting point waxes in an emulsion of the other ingredients of said crude oil in water; and collecting the thus precipitated high melting point waxes, thereby obtaining dispersions of asphaltenes and resins in substantially pure high melting point waxes.

## SATURATING OF A HYDROCARBON FRACTION WITH HYDROGEN AND THEN HYDRODESULFURIZING SAID FRACTION

Vladimir Haensel, Hinsdale, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Application August 19, 1953, Serial No. 375,292
8 Claims. (Cl. 196—24)

1. A process for refining an unsaturated sulfur-containing hydrocarbon distillate which comprises saturating unsaturated hydrocarbons in said distillate by subjecting the distillate to hydrogenation in the presence of a hydrogenating catalyst containing a member selected from the group consisting of platinum and palladium at below desulfurizing temperature and thereafter subjecting the thus saturated sulfur-containing distillate to desulfurization in the presence of a desulfurizing catalyst containing a group VI metal and a metal of the iron group of the periodic table.

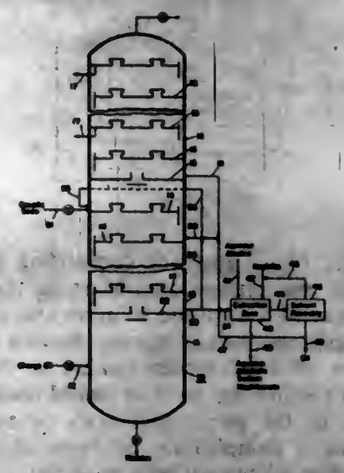
2,770,579

## PRODUCTION OF SPECIAL SOLVENT PETROLEUM NAPHTHAS BY REFINING WITH SODIUM

Weldon G. Annable, Mundelein, Kenneth Lucas, Woodstock, and Robert M. Haines, Crystal Lake, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio

No Drawing. Application September 9, 1954, Serial No. 455,664
10 Claims. (Cl. 196—28)



1. The method for producing special solvent naphthas from petroleum hydrocarbon mixtures containing small amounts of total sulfur of not more than about 0.025 weight percent which comprises contacting said petroleum hydrocarbon mixture with alkali metal at a temperature of above 400° F. and below 500° F. and separating special solvent naphthas therefrom characterized by their ability to pass the distillation-corrosion test.

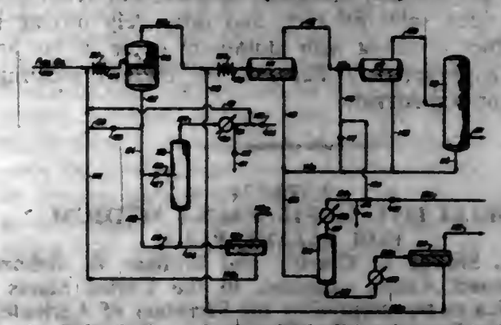
2,770,580

## ALKALINE TREATMENT OF PETROLEUM VAPORS

Earl M. Honeycutt, Claymont, Del., and Curtis C. Walin, Springfield, Pa., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

Application September 17, 1953, Serial No. 380,642
8 Claims. (Cl. 196—36)

1. In the removal of naphthenic acids from heavy petroleum lubricating oil vapors by contact with liquid alkaline material in a contacting zone at a temperature within the approximate range from 600° F. to 700° F. under reduced pressure permitting vapor phase contacting at said temperature, the improvement which comprises: initiating contact of said vapors with said alkaline material in a portion of said contacting zone wherein said alkaline material comprises 60 to 95 parts by weight of liquid lubricating oil, 3 to 30 parts of alkali metal naphthenates, and 0.2 to 10 parts of alkali metal hydroxide, whereby formation of carbonaceous deposits normally occurring in said contacting zone at said temperature, is inhibited.



---

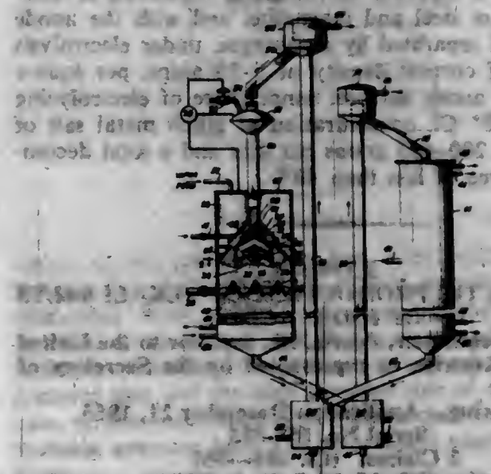
2,770,581

## STABILIZATION OF FUEL OIL

Frank W. Brooks, Jr., and Claiborne A. Duval, Jr., Beaumont, Tex., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application April 27, 1953, Serial No. 351,168
2 Claims. (Cl. 196—41)

1. A method of producing fuel oil having an A. S. T. M. color not darker than 3½ after storage in a glass bottle at 100° F. for two months, which comprises intimately mixing a fuel oil having an A. S. T. M. color darker than 3½ with a first aqueous solution containing as its sole essential solute about 20 to about 55 weight percent sodium hydroxide at an oil-to-sodium hydroxide solution ratio of about 4:1 to about 20:1, separating partially treated oil from fouled first aqueous sodium hydroxide solution containing sodium salts of material extracted from said oil, intimately mixing said partially treated oil with a second aqueous solution containing as its sole essential solute about 35 to about 55 weight percent potassium hydroxide at an oil-to-potassium hydroxide solution ratio of about 5:1 to about 200:1, separating treated oil from fouled second aqueous potassium hydroxide solution containing potassium salts of material extracted from said partially treated oil, water-washing said treated oil, separating said water-washed treated oil from wash water, removing entrained wash water from said treated oil to obtain a treated oil having an A. S. T. M. color not darker than 3½ after storage in a glass bottle at 100° F. for two months.



---

2,770,582

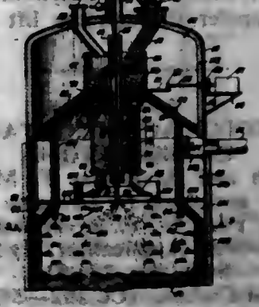
## METHOD AND APPARATUS FOR THE CONVERSION OF HIGH BOILING LIQUID HYDROCARBONS

Sylvander C. Eastwood, Woodbury, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

Application October 7, 1952, Serial No. 313,546
9 Claims. (Cl. 196—52)

1. A continuous process for the conversion of high boiling liquid hydrocarbons to lower boiling hydrocarbons in the presence of a downwardly moving, substantially compact columnar mass of granular contact material which comprises: mixing granular contact material at a temperature suitable for the desired conversion with a high boiling liquid hydrocarbon charge, supplying said contact material mixed with liquid charge and fresh contact material free of liquid charge and at a temperature suitable for the desired conversion onto at least one contact material surface below which is a substantially compact columnar mass of granular contact material within a confined conversion zone as alternate layers of contact material containing liquid charge and fresh contact material free of liquid charge, said layers being applied one on top of the other to said surface so that along a vertical line within said mass there are alternate layers of contact material initially supplied mixed with liquid charge and contact material initially supplied free of liquid charge, passing the liquid charge through the columnar mass to effect the desired conversion to lower boiling hydrocarbon products, removing hydrocarbon products from the columnar mass and removing contact material from the lower section of the columnar mass.

---



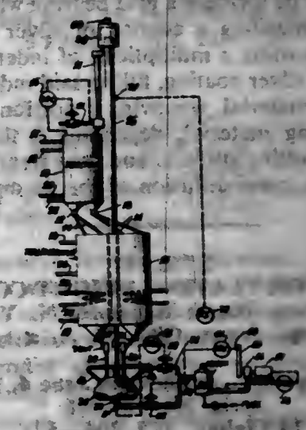
2,770,583

## METHOD AND APPARATUS FOR THE CONVERSION OF LIQUID HYDROCARBONS IN THE PRESENCE OF A GRANULAR CONTACT MATERIAL

James H. Haddad, Woodbury, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

Application July 5, 1952, Serial No. 297,233
7 Claims. (Cl. 196—52)

1. A process for the conversion of high boiling liquid hydrocarbons to lower boiling gaseous products in the presence of a granular contact material, which comprises: maintaining a substantially compact column of granular contact material throughout the lower section of a confined conversion zone, maintaining a gas space above said column in the upper section of said conversion zone, removing contact material from the lower section of said column so as to promote the downward movement of contact material granules in said column, passing contact material into the upper section of said gas space and downwardly through said gas space and onto the upper surface of said column as a tubular shower, passing additional contact material into said gas space and downwardly through said gas space and onto the upper surface of said column as a second tubular shower positioned concentrically about said first-named tubular shower, baffling the flow of contact material in said second shower so as to reduce the rate of acceleration of the particles in said second shower while confining the particles laterally so that a major portion of the contact material in said shower passes downwardly in a single downward path, spraying high boiling liquid hydrocarbon charge into said first-named shower from a point within said shower and above said column whereby the liquid charge will be sorbed on showering contact material granules, passing the liquid charge downwardly through said column to effect the desired conversion to lower boiling gaseous products, and removing gaseous products from the conversion zone separately of the contact material.



---

2,770,584

## METHOD OF OPERATING A PNEUMATIC LIFT USED TO TRANSPORT GRANULAR SOLIDS IN A HYDROCARBON CONVERSION PROCESS

Frederick E. Ray, Woodbury, and Robert D. Drew, Wenonah, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application December 11, 1951, Serial No. 261,062
3 Claims. (Cl. 196—52)

1. In a hydrocarbon conversion process in which a granular solid is gravitated as a substantially compact columnar mass through reaction and regeneration zones and lifted from a location below one of the zones to a location above the other zone through an upwardly di-

rected lift passage by means of a flowing stream of lift gas, the improved method of controlling the lifting step for optimum performance with minimum attrition which comprises: gravitating granular solids downwardly from the bottom of one of the zones to a feeding zone located at the bottom of the lift passage, introducing a lift gas into the feeding zone, so as to support and transport the granular solids upwardly through the lift passage, measuring continuously the static pressure in said passage at a location in the upper two thirds of the passage, and controlling the flow rate of the lift gas admitted to said feeding zone in response to said static pressure, so that the flow is maintained below that point at which minimum pressure occurs and slightly above that point at which the pressure increases very substantially with any further reduction in gas flow rate, whereby the attrition of the granular solids during transfer through the lift passage is minimized.

2,770,585

## PURIFICATION OF ACIDS CONTAINING 2 TO 6 CARBON ATOMS

Eldred T. Smith and Alexander F. MacLean, Corpus Christi, Tex., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware

No Drawing. Application July 2, 1952, Serial No. 296,936
14 Claims. (Cl. 202—59)

7. Process for the removal of formic acid from a mixture comprising principally a lower fatty acid containing from 2 to 6 carbon atoms and containing up to 10% of formic acid, which process comprises adding to said mixture the anhydride of said lower fatty acid, reacting said anhydride with the formic acid in said mixture to produce carbon monoxide and said lower fatty acid, and distilling said lower fatty acid, there being present in the reaction mixture insufficient water to prevent the reaction between the anhydride and the formic acid.

---

2,770,586

## GRID BEARING AND METHOD OF MAKING SAME

Elmer G. Davis, Brownsburg, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application January 8, 1953, Serial No. 330,256
9 Claims. (Cl. 204—37)

1. A method of forming a grid bearing which comprises the steps of depositing a coating of silver on a backing member, die forming a multiplicity of indentations in the surface of said silver coating, filling said indentations with a soft bearing material, removing a portion of said silver and soft bearing material, depositing a thin coating of tin over the resulting surface, and heat treating the resultant structure to cause diffusion of the tin and silver.

---

2,770,587

## BATH FOR PLATING BRIGHT COPPER

Burnet D. Ostrow, North Bellmore, N. Y., assignor to Electrum Corp., Jersey City, N. J., a corporation of New Jersey

No Drawing. Application June 4, 1956, Serial No. 588,986
14 Claims. (Cl. 204—52)

1. An electrolytic bath comprising an aqueous alkaline solution of a cyanide of copper, and a soluble selenium compound in which the selenium has a valence of —2 in amount sufficient to exert a brightening effect on the copper deposit.

2,770,588

## METHOD OF RECOVERING FATTY ACID AND ALKALI BY THE ELECTROLYSIS OF AN AQUEOUS SOLUTION OF AN ALKALI METAL SALT OF A FATTY ACID

Shinzo Okada, Kyoto-shi, and Tomotsu Enichi, Okayama-shi, Japan, assignors, by direct and mesne assignments, of three-fourths to Kurashiki Rayon Co., Ltd., Kurashiki-shi, Okayama Prefecture, Japan, a corporation of Japan, and one-fourth to Air Reduction Company, Incorporated, New York, N. Y., a corporation of New York

No Drawing. Application February 26, 1953, Serial No. 339,174
Claims priority, application Japan March 1, 1952
5 Claims. (Cl. 204—72)

1. A process for recovering fatty acid and alkali from an alkali metal salt of a fatty acid which comprises electrolyzing an aqueous solution of an alkali metal salt of a fatty acid of the formula of R—COOH, where R is an alkyl group composed of 1–3 carbon atoms, with an anode consisting of a member of the group consisting of acid-proof stainless steel and magnetite, and with the anode compartment separated by diaphragm, under electrolysis conditions of current density of 5–30 amps. per square decimeter of anode surface, temperature of electrolyzing cell of 40–80° C., concentration of alkali metal salt of fatty acid of 200–400 grams per liter and a total decomposition degree of less than 60%.

---

2,770,589

## ELECTROLYTIC PRODUCTION OF ALKALI SALTS OF IODIC ACID

Charles L. McIlhenny, Peoria, Ill., assignor to the United States of America as represented by the Secretary of Agriculture

No Drawing. Application December 21, 1955, Serial No. 554,595
2 Claims. (Cl. 204—95)
(Granted under Title 35, U. S. Code (1952), sec. 266)

2. A process for preparing sodium iodate comprising passing an electric current through a 2-compartment cell divided by a porous partition, said cell containing in one of its compartments as anolyte a solution of elemental iodine in aqueous sodium hydroxide in which is immersed a carbon anode and containing in its other compartment as catholyte an aqueous solution of sodium hydroxide in which is immersed an iron cathode, whereby the elemental iodine is oxidized to sodium iodate at the said carbon anode.

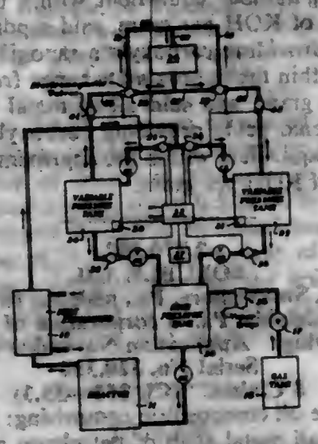
2,770,590

## REACTOR CIRCULATING SYSTEM



James T. Serduke, El Cerrito, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission

Application May 17, 1950, Serial No. 162,553
1 Claim. (Cl. 204—193)

A reactor coolant circulating system for a nuclear reactor wherein the reactor is connected to a heat exchanger by a liquid-carrying duct passing through the reactor and the heat exchanger, the combination with the reactor and heat exchanger of a high pressure coolant tank duct-connected to said liquid carrying duct at the reactor end thereof; first and second variable pressure liquid coolant tanks; a first and second outlet duct each duct including an electromagnetically-controlled flow valve, said outlet ducts connecting said first and second variable pressure tanks to said high pressure coolant tank: duct means, containing electromagnetically-controlled flow valve means, connecting said first and second variable pressure tanks to said liquid-carrying duct at the heat exchanger end, a gas pressure duct network containing a unidirectional gas pressure source having a gas inlet and outlet, a first and second electromagnetically-controlled

two position valve, said gas source inlet being connected through one position of said first and second electromagnetically-controlled valves to a first and second gas duct, said first and second gas duct connected respectively to said first and second variable pressure tanks; a gas collecting duct connected between the second positions of said first and second electromagnetically-controlled valves and said gas pressure source inlet; a liquid level control located in each of said variable pressure tanks, electrical

switch means controlled by said level controls for controlling the relative positions of said electromagnetically-controlled flow valve, said electromagnetic-controlled flow valve means and said first and second electromagnetically-controlled two position valves, whereby the low pressure side and the high pressure side of said gas pressure source are respectively connected to a depleted variable pressure tank and to a filled variable pressure tank.

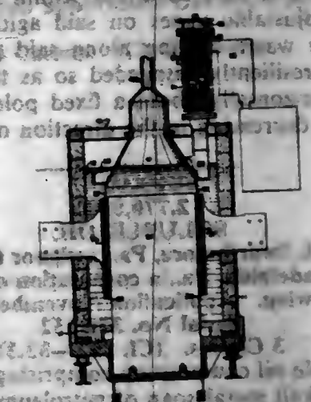
2,770,591

## HEAVY WATER MODERATED NEUTRONIC REACTOR

Eugene P. Wigner, Princeton, N. J., Leo A. Ohlinger and Gale J. Young, Chicago, Ill., and Alvin M. Weinberg, Oak Ridge, Tenn., assignors to the United States of America as represented by the United States Atomic Energy Commission

Application July 3, 1946, Serial No. 681,252
6 Claims. (Cl. 204—193)



1. A neutronic reactor comprising a reaction tank, a plurality of vertically disposed tubes within said tank, elongated bodies containing material fissionable by neutrons of thermal energy disposed within the tubes, a body of heavy water at least partially filling the tank, the elongated bodies within the tubes being spaced therefrom to provide passages, and means to flow a liquid coolant upwardly through the passages in heat exchange relationship with the bodies and the tubes.

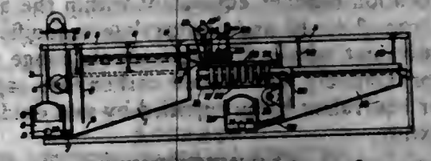
2,770,592

## PURIFICATION DEVICE FOR ALKALI METAL CELLS

Arthur L. Fentress, Baton Rouge, La., assignor to Ethyl Corporation, New York, N. Y., a corporation of Delaware

Application November 6, 1953, Serial No. 390,543
5 Claims. (Cl. 204—245)

1. In a cell for electrolytic production of sodium from fused salts, having a riser pipe extending above the cell for concurrently discharging the sodium metal, cooling and precipitating calcium impurity and returning the calcium metal, the improvement comprising a helical blade within the riser pipe, the helix having a length approximately equal to the length of the riser pipe and a diameter approaching the diameter of the riser pipe, and being positioned within said riser pipe, the blade being relatively narrow with respect to the diameter of the riser pipe thereby defining an open space within said helix, said helical blade being attached to a shaft concentric with and projecting from the top of the riser pipe, the blade and shaft being rotatable, and vertically movable in a limited distance, motor means operatively connected to the shaft for rotating the shaft and helical blade, and means synchronized with said motor means for imparting a vertical reciprocating motion to the shaft and helical blade at least once in every revolution, the upward portion of the reciprocating movement being at a low and substantially uniform rate, the downward portion being abrupt and accelerated, thereby dislodging calcium particles from the riser pipe and preventing adhesion of said calcium particles to the helical blade.



---

2,770,593

## PURIFICATION OF WASTE WATER

Hans Heymann, Ulm (Donube), Germany

Application May 23, 1951, Serial No. 227,779
5 Claims. (Cl. 210—16)

1. An apparatus for the purification of waste water consisting of a vibratable structure defining a flow path for said water, said structure comprising a first resiliently suspended preliminary purifying container, a second resiliently suspended afterpurifying container, a resiliently suspended mixing gutter between said first and second containers, and a highly resilient tongue between said first container and said mixing gutter, over which the water is constrained to flow, means for closing chemical additives to said mixing gutter, means for controlling said dosing means, said means for controlling being operatively connected to said tongue so that the amount of

additive is directly governed by the amount of water passing over said tongue, a storage container and a resilient connection thereto for each of said first and second containers, the bases of said first and second containers being inclined against the direction of flow of said water and having outlet openings to said resilient connections to said storage containers for leading off sludge, an agitator for mixing said additives within said gutter, and angularly adjustable vanes on said agitator, adapted to dip into the water flowing along said gutter, said agitator being resiliently suspended so as to be capable of vibrating horizontally about a fixed pole, the amplitude of vibration decreasing in the direction of said pole.

**2,770,594**
**SOLUBLE OIL**
James L. Jezl, Swarthmore, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
No Drawing. Application November 13, 1952, Serial No. 320,352
3 Claims. (Cl. 252—33.3)

1. A soluble oil composition comprising: mineral lubricating oil; alkali metal soap of petroleum mahogany sulfonic acids; alkali metal soap of carboxylic acids obtained by partial oxidation of mineral oil; 2.25 to 5.0 volume percent of water; and 1.25 to 3.0 volume percent of a phenyl alkanol having 7 to 9 carbon atoms inclusive; said soluble oil having sulfonate saponification number equivalent within the range from 3 to 10 mg. of KOH per gram and carboxylate saponification number equivalent within the range from 10 to 20 mg. of KOH per gram.

---

**2,770,595**
**SOLUBLE OIL**
James L. Jezl, Swarthmore, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
No Drawing. Application November 13, 1952, Serial No. 320,351
2 Claims. (Cl. 252—33.3)

1. A soluble oil composition comprising: mineral lubricating oil having S. U. viscosity at 100° F. within the range from 40 to 120 seconds; alkali metal soap of petroleum mahogany sulfonic acids; alkali metal soap of petroleum naphthenic acids; a saponified oxidation product mixture obtained by partially oxidizing petroleum foots oil in liquid phase at a temperature in the range from 260° F. to 320° F. and a pressure from atmospheric to 100 p. s. i. g. in the presence of a metallic oxidation catalyst until the saponification number of the oxidation product mixture is within the range from 60 to 120 mg. of KOH per gram, and saponifying said oxidation product mixture with an alkali metal basic compound; 2.75 to 5.0 volume percent of water; and 1.25 to 3.0 volume percent of cyclohexanol; said soluble oil having sulfonate saponification number equivalent within the approximate range from 3 to 10 and carboxylate saponification number equivalent within the approximate range from 10 to 20, approximately half of said carboxylate saponification number equivalent being supplied by said oxidation product mixture.

---

**2,770,596**
**SOLUBLE OIL**
James L. Jezl, Swarthmore, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
No Drawing. Application November 13, 1952, Serial No. 320,353
4 Claims. (Cl. 252—33.3)

1. A soluble oil composition comprising: mineral lubricating oil; alkali metal soap of petroleum mahogany sulfonic acids; alkali metal soap of petroleum naphthenic acids; a saponified oxidation product mixture obtained by partially oxidizing petroleum foots oil in liquid phase at a temperature in the range from 260° F. to 320° F. and a pressure from atmospheric to 100 p. s. i. g. in the presence of a metallic oxidation catalyst until the saponification number of the oxidation product mixture is within the range from 60 to 120 mg. of KOH per gram, and saponifying said oxidation product mixture with an alkali metal basic compound; 1.75 to 3.0 volume percent of an alcohol consisting essentially of a primary amyl alcohol; and 2.75 to 5.0 volume percent of water; said soluble oil having sulfonate saponification equivalent within the range from 3 to 10 mg. of KOH per gram and carboxylate saponification number equivalent within the range from 10 to 20 mg. of KOH per gram, said saponification product mixture providing carboxylate saponification number equivalent within the approximate range from 5 to 10 mg. of KOH per gram, and said alkali metal soap of petroleum naphthenic acids providing carboxylate saponification number equivalent within the approximate range from 5 to 10 mg. of KOH per gram.

---

**2,770,597**
**SOLUBLE OIL**
James L. Jezl, Swarthmore, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
No Drawing. Application November 13, 1952, Serial No. 320,354
8 Claims. (Cl. 252—33.3)

1. A soluble oil composition comprising: mineral lubricating oil; alkali metal soap of petroleum mahogany sulfonic acids; alkali metal soap of petroleum naphthenic acids; a saponified oxidation product mixture obtained by partially oxidizing petroleum foots oil in liquid phase at a temperature in the range from 260° F. to 320° F. and a pressure from atmospheric to 100 p. s. i. g. in the presence of a metallic oxidation catalyst until the saponification number of the oxidation product mixture is within the range from 60 to 120 mg. of KOH per gram, and saponifying said oxidation product mixture with an alkali metal basic compound; 2.25 to 5.0 volume percent of water; and 0.75 to 3.0 volume percent of an organic compound selected from the group consisting of a dihydroxy alkane having 8 to 10 carbon atoms inclusive and an alkoxy dihydroxy alkane having 9 to 11 carbon atoms inclusive; said soluble oil having sulfonate saponification number equivalent within the approximate range from 3 to 10 mg. of KOH per gram and carboxylate saponification number equivalent within the approximate range from 10 to 20 mg. of KOH per gram, said saponified oxidation product mixture providing carboxylate saponification number equivalent within the approximate range from 5 to 10 mg. of KOH per gram and said alkali metal soap of petroleum naphthenic acids providing carboxylate saponification number equivalent within the approximate range from 5 to 10 mg. of KOH per gram.

---

**2,770,598**
**SOLUBLE OIL**
James L. Jezl, Swarthmore, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
No Drawing. Application March 23, 1956, Serial No. 573,328
5 Claims. (Cl. 252—33.3)

1. A soluble oil composition comprising: mineral lubricating oil; alkali metal soap of petroleum mahogany sulfonic acids; alkali metal soap of petroleum naphthenic acids; alkali metal soap of carboxylic acids obtained by partial oxidation of mineral oil; 2.25 to 5.0 volume percent of water; and 1.25 to 3.0 volume percent of a compound selected from the group consisting of compounds having the formula $RCH_2O(CH_2CH_2O)_nH$ and compounds having the formula $RCOO(CH_2CH_2O)_nH$, R in each formula being a radical having 4 to 21 carbon atoms inclusive and selected from the group consisting of aliphatic and cycloaliphatic radicals, and $n$ in each formula being an integer greater than 3 and within the range from $(x-4)$ to $(x+4)$ where $x$ is the number of carbon atoms in R; said soluble oil having sulfonate saponification number equivalent within the range from 3 to 10 mg. of KOH per gram and carboxylate saponification number equivalent within the range from 10 to 20 mg. of KOH per gram.

---

**2,770,599**
**STABLE LIQUID SHAMPOOS**
Hyman Hoskin, Bayside, N. Y., assignor to Colgate-Palmolive Company, a corporation of Delaware
No Drawing. Application September 23, 1953, Serial No. 381,988
11 Claims. (Cl. 252—117)

1. An opaque liquid shampoo consisting essentially of about 5 to 35% by weight of a detersive salt from the group consisting of water-soluble anionic sulfated and sulfonated detersive salts, about 0.5 to 10% by weight of behenic acid present therein as an opacifying and stabilizing agent, about 0.25 to 3% by weight of a highly hydrogenated castor oil having a melting point of at least about 180° F., and water in an amount sufficient to prepare a fluid composition, said shampoo having a pH of from 5 to 7.5.

---

**2,770,600**
**PARTICULATE DETERGENT COMPOSITIONS**
Louis Gene Ricciardi, Brooklyn, N. Y., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware
No Drawing. Application November 26, 1954, Serial No. 471,491
6 Claims. (Cl. 252—131)

1. A detergent composition consisting essentially of a water-soluble particulate organic detergent in spray dried form, the major portion of said particles being retained upon a standard U. S. No. 100 sieve, admixed with from ¼ to 10% by weight of the total mixture of powdered anhydrous aluminum silicate prepared by calcining kaolin and having the approximate formula $Al_2O_3 \cdot 2SiO_2$, said composition exhibiting an increased bulk density in comparison to similar spray dried particles which have not been admixed with anhydrous aluminum silicate.

**2,770,601**
**METHOD OF PREPARING BILIRUBIN STANDARDIZED REAGENTS**
Theodore E. Weichselbaum, Normandy, Mo., assignor to A. S. Aloe Company, St. Louis, Mo., a corporation of Missouri
Original application June 25, 1951, Serial No. 233,465, now Patent No. 2,664,403, dated December 29, 1953. Divided and this application October 15, 1953, Serial No. 391,657
4 Claims. (Cl. 252—408)

1. The method of making bilirubin standardized reagents for use in colorimetry and in checking the accuracy of spectrophotometric calibration tables which method comprises providing a predetermined quantity of bilirubin, dissolving the measured quantity of bilirubin in a predetermined volume of chloroform to provide a solution of predetermined concentration, placing a measured quantity of solution within a glass container, evaporating the liquid material in the container for reduction thereof to a dry, solid state, then sealing the container in an inert atmosphere, opening the container at the time of preparation of the standard, dissolving the dry reagent in such amount of chloroform as requisite for complete dissolution of the dried material, then quantitatively transferring same by methyl alcohol to a flask having a volume-indicating mark, and then making up to the mark with methyl alcohol to constitute a standard of predetermined concentration.

---

**2,770,602**
**METHOD OF PREPARING PROTEIN STANDARDIZED REAGENTS**
Theodore E. Weichselbaum, Normandy, Mo., assignor to A. S. Aloe Company, St. Louis, Mo., a corporation of Missouri
Original application June 25, 1951, Serial No. 233,465, now Patent No. 2,664,403, dated December 29, 1953. Divided and this application October 15, 1953, Serial No. 391,658
4 Claims. (Cl. 252—408)

1. The method of making protein standardized reagents for use in colorimetry and in checking the accuracy of spectrophotometric calibration tables as utilized for the determination of total serum protein, which method comprises determining the protein content in a predetermined quantity of non-human blood plasma, diluting the predetermined quantity of plasma in a .85 percent sodium chloride solution to provide a liquid reagent of predetermined concentration of protein, placing a measured quantity of the liquid reagent within a glass container, freezing the liquid material in the container, subjecting the frozen material to a high vacuum system for complete desiccation of the reagent to provide a solid standardized reagent, then sealing the container under vacuum, opening the container at the time of preparation of the standard, then transferring the reagent into a container of predetermined volume having a volume indicating mark, and then making up to the mark with diluent to constitute a standardized reagent of predetermined concentration.

---

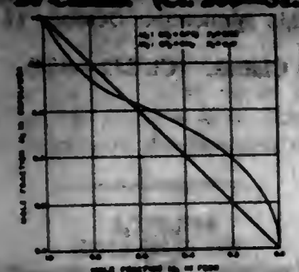
**2,770,603**
**PRODUCTION OF SYNTHETIC RESINS BY REACTION OF DIOLEFIN POLYMERS WITH $SO_2$**
Charles S. Lynch, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application December 31, 1952, Serial No. 329,100
31 Claims. (Cl. 260—29.7)

30. A latex of a heteropolymeric reaction product formed by the reaction of sulfur dioxide with a polymer while present as product in a latex produced by aqueous emulsion polymerization of a diene selected from the group consisting of an unsubstituted conjugated diolefin and a conjugated diolefin containing at least one substituent radical selected from the group consisting of phenyl, alkyl, cyano, cyanate, isocyanate, thiocyanate, isothiocyanate and alkoxy.

---

**2,770,604**
**RUBBER PLASTICIZED WITH ZINC SALTS OF NUCLEAR CHLORINATED AROMATIC MERCAPTANS**
Arthur A. Baum, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 9, 1952, Serial No. 281,477
9 Claims. (Cl. 260—30.8)

1. The process of plasticizing a rubber which comprises milling the rubber and adding thereto from 0.05% to 5.0% by weight, based on the weight of the rubber, of a plasticizing agent consisting of the zinc salt of trichlorophenyl mercaptan as the sole essential ingredient.



2,770,595

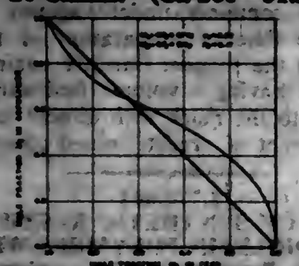
**SOLUTIONS OF COPOLYMERS OF A PERFLUOROCHLOROETHYLENE AND A FLUOROETHYLENE**

Francis J. Honn, Westfield, N. J., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

Application December 16, 1954, Serial No. 475,770

20 Claims. (Cl. 260—31.5)

1. A solution which comprises as a solute a copolymer containing between above 69 and not higher than about 80 mole percent of a perfluorochloroethylene copolymerized with a different partially fluorinated ethylene as the remaining major constituent and as a solvent at least one oxygen containing saturated aliphatic organic compound having a boiling point between about 55° C. and about 160° C. of the group consisting of esters, ketones and ether alcohols.



2,770,596

**SOLUTIONS OF COPOLYMERS OF A PERFLUOROCHLOROETHYLENE AND A FLUOROETHYLENE**

Wilbur O. Teeters, River Edge, Herbert J. Passino, Englewood, and Albert L. Dittman, North Bergen, N. J., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

Application December 16, 1954, Serial No. 475,776

20 Claims. (Cl. 260—31.2)

1. A solution which comprises as a solute a copolymer containing between about 20 and about 69 mole percent of a perfluorochloroethylene copolymerized with a different partially fluorinated ethylene as the remaining major constituent and as a solvent at least one oxygen containing saturated aliphatic organic compound having a boiling point between about 55° C. and about 160° C. of the group consisting of esters, ketones and ether alcohols.

2,770,597

**RESINOUS PRODUCTS CONTAINING FREE HYDROXYL RADICALS PREPARED BY POLYMERIZING ACRYLONITRILE IN ADMIXTURE WITH AN INTERPOLYMER OF AN ALKENOL AND ANOTHER UNSATURATED MONOMER**

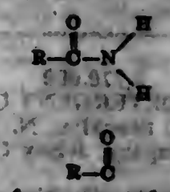
Hugh J. Hagemeyer, Jr., and Elizabeth L. Oglesby, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application April 1, 1952, Serial No. 279,912

14 Claims. (Cl. 260—30.2)

1. A process for preparing a composite resinous composition comprising polymerizing, at an elevated temperature in the presence of a peroxide polymerization catalyst, from about ⅗ to ⅘ part by weight of acrylonitrile in admixture with from ⅕ to about ⅖ part by weight of a previously polymerized hydroxy-containing interpolymer containing three distinct types of recurring units in the interpolymer molecules, which interpolymer was derived from the partial deacylation of the polymeric product obtained by the interpolymerization of (1) a lower alkanoate of an alkenol selected from the group consisting of isopropenyl alcohol and vinyl alcohol and (2) a mono-ethylenically unsaturated compound selected from the group consisting of ethylene, propylene, styrene, a lower alkyl maleate, vinyl cyanoethyl formal, vinyl chloride and acrylonitrile, said interpolymer being characterized by the presence of from about 3% to about 20% by weight of the interpolymer of free hydroxyl radicals derived from the interpolymerized lower alkanoate of the alkenol.

2,770,598



**POLYETHYLENE COMPOSITION**

Harold C. Barber, Wilmington, Del., Ernest E. Lewis, Claudia Ford, Pa., and William H. Happoldt, Jr., Claymont, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 12, 1954, Serial No. 461,908

9 Claims. (Cl. 260—32.6)

1. A plastic composition comprising solid polyethylene and 0.1% to 0.5% by weight of an amide having the formula

in which

is the acyl radical of a saturated fatty acid containing 10 to 16 carbon atoms, based on the weight of polyethylene.

2,770,599

**POLYETHYLENE-OLEAMIDE COMPOSITION**

Albert Edward Symonds, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application August 26, 1953, Serial No. 376,745

5 Claims. (Cl. 260—32.6)

1. A plastic composition comprising polyethylene and 0.01% to 0.5% by weight of oleamide, based on the weight of polyethylene.

2,770,610

**ESTERS OF EPOXIDIZED PHOSPHONIC ACIDS AND HALOGENATED ORGANIC MATERIALS STABILIZED THEREWITH**

Edgar E. Hardy and Theodor Reetz, Anniston, Ala., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application October 30, 1952, Serial No. 317,832

3 Claims. (Cl. 260—45.9)

2. A halogenated organic material containing stabilizing amounts of di-n-butyl 9,10-epoxyoctadecane phosphonate.

2,770,611

**HALOGENATED POLYMERS STABILIZED WITH A HEXAORGANODISTANNOXANE**

Siegfried Nitzsche and Rudolf Wiedle, Burghausen, Germany, assignors to Wacker Chemie G. m. b. H., Munich, Germany

No Drawing. Application March 9, 1954, Serial No. 415,148

Claims priority, application Germany March 14, 1953

3 Claims. (Cl. 260—45.75)

1. A composition consisting essentially of a chlorohydrocarbon high polymer and from 0.1 to 3 percent by weight based on the weight of the polymer of a distannoxane of the formula $R_2SnOSnR_2$, where R is a hydrocarbon radical selected from the group consisting of aliphatic, alicyclic, and aromatic radicals.

2,770,612

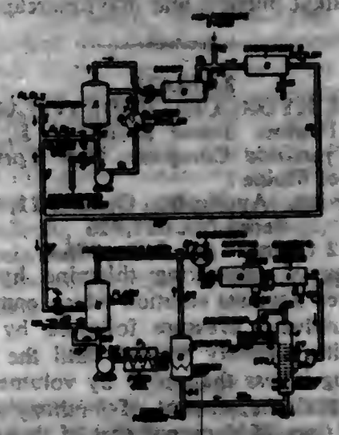
**ELASTOMERIC DIISOCYANATE-MODIFIED POLYESTERS**

Charles S. Schollenberger, Cuyahoga Falls, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York

No Drawing. Application January 23, 1952, Serial No. 267,015

12 Claims. (Cl. 260—75)

1. The process of producing a rubbery, processable, substantially linear polyesterurethane gum vulcanizable to a tensile strength of greater than 5,000 pounds per square inch which consists essentially of reacting one mole of a linear aliphatic hydroxyl polyester of ethylene glycol and an aliphatic dicarboxylic acid having a molecular weight of 600 to 1,200, a hydroxyl number of 95 to 185, a hydroxyl content of 2.8 to 5.7 percent and an acid number below 2 with 1.02 to no greater than 1.1 moles of an aromatic diisocyanate selected from the class consisting of phenylene diisocyanates and 1,5-naphthylene diisocyanate.



2,770,613

**NOVEL PETROLEUM RESIN PROCESS**

Bruce E. Tegge, Chatham, and Fred W. Reuse, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application July 2, 1953, Serial No. 365,739

8 Claims. (Cl. 260—82)

1. An improved process for making hydrocarbon resins which comprises the steps of polymerizing a $C_5$ plus unsaturated hydrocarbon stream boiling up to 280° C. with a fluid aluminum chloride catalyst, contacting in presence of the remaining active catalyst the resulting reactant mixture with water in liquid phase at about 100–200° C. and subjecting the hydrolyzed mixture to stripping to recover an unreacted hydrocarbon fraction and a light-colored, low ash resin.

2,770,614

**PROCESS FOR POLYMERIZING CRACKED FRACTIONS CONTAINING A METHYL STYRENE**

Thomas Heaton Howarth, John Downing, and James Gordon Napier Drewitt, Spondon, near Derby, England, assignors to British Celanese Limited, a corporation of Great Britain

No Drawing. Application May 25, 1951, Serial No. 228,360

Claims priority, application Great Britain June 2, 1950

6 Claims. (Cl. 260—82)

1. Process for the production of a synthetic resin, which comprises effecting polymerization in a mixture of hydrocarbons containing unsaturated constituents none of which boils below 130° C., at least 70% of the total weight of the unsaturated constituents consisting of a substance selected from the class consisting of beta-methyl styrene and indene, and said total weight not containing as much as 5% of any di-unsaturated substance, the polymerization being effected by the action of aluminum chloride in solution in a molar excess of diethyl ether at a temperature of —10 to +30° C.

2,770,615

**COPOLYMER OF TRIFLUOROCHLOROETHYLENE AND VINYLIDENE CHLORIDE AND A METHOD OF MANUFACTURING SAME**

Charles O. Krencke, Jr., Bayonne, N. J., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application August 4, 1951, Serial No. 240,453

5 Claims. (Cl. 260—87.7)

3. A method for preparing a copolymer of trifluorochloroethylene and vinylidene chloride which comprises polymerizing a reaction mixture comprising between 20 and not more than 98 mol percent of vinylidene chloride and between not less than 2 and 80 mol percent of trifluorochloroethylene in the presence of a halogenated acyl peroxide at a temperature between about —20° C. and about 20° C. to produce a thermoplastic copolymer comprising more than two mol percent and less than 50 mol percent of trifluorochloroethylene and the remaining major constituent being vinylidene chloride.

2,770,616

**FRACTIONATION OF PROTEINACEOUS MATERIALS IN BLOOD PLASMA AND LIVER TISSUE**

Edwin J. Cohn, Cambridge, Mass.; Rebekah E. Cohn, Charles A. Coolidge, and Eustace Salignac, executors of said Edwin J. Cohn, deceased, assignors to Protein Foundation, Incorporated, Cambridge, Mass., a non-profit corporation

No Drawing. Application January 29, 1951, Serial No. 212,204

5 Claims. (Cl. 260—112)

1. A method for the quantitative separation of albumin from the fibrinogen and gamma globulin content of blood plasma comprising equilibrating the plasma at a temperature near the freezing point of the plasma at a pH of 6.8 to 7.4 and an ionic strength of approximately 0.15, in the presence of a sufficient quantity of zinc ions to precipitate the fibrinogen and gamma globulin content of the plasma in the form of insoluble zinc complexes while retaining the solubility of the albumins and thereafter separating the soluble albumins from the insolubilized fibrinogen and gamma globulin zinc complexes.

2,770,617

**2,5-BIS-ETHYLENEIMINO-HYDROQUINONE AND PROCESS FOR PREPARING SAME**

Adrian Marxer, Basel, Switzerland, assignor to Ciba Pharmaceutical Products, Inc., Summit, N. J.

No Drawing. Application April 25, 1955, Serial No. 503,785

Claims priority, application Switzerland April 30, 1954

6 Claims. (Cl. 260—239)

1. A process which comprises contacting paraquinone with ethyleneimine in molecular ratio of from about 1:2.5 to about 1:4 at a temperature of from about 40° C. to about 100° C., and isolating the resulting 2,5-bis-ethyleneimino-hydroquinone.

2,770,618

**TOMATIDINE DERIVATIVES**

Richard Kuhn and Irmentraut Löw, Heidelberg, Germany, assignors, by mesne assignments, to American Home Products Corporation, New York, N. Y., a corporation of Delaware

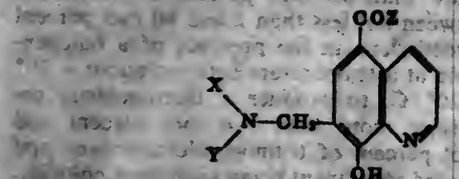
No Drawing. Application October 7, 1952, Serial No. 313,593

2 Claims. (Cl. 260—239.5)

1. The product resulting by prolonged heating, with glacial acetic acid, of diacetyltomatidine of melting point

approximately 194° C., said diacetyl-pseudotomatidine product constituting an amorphous, colorless compound of empiric formula $C_{31}H_{49}O_4N$, melting at 90–92° C., and boiling at 270–280° C. at a reduced pressure of 0.001 millimeter of mercury.

---



2,770,619

## SUBSTITUTED 8-QUINOLINOLS

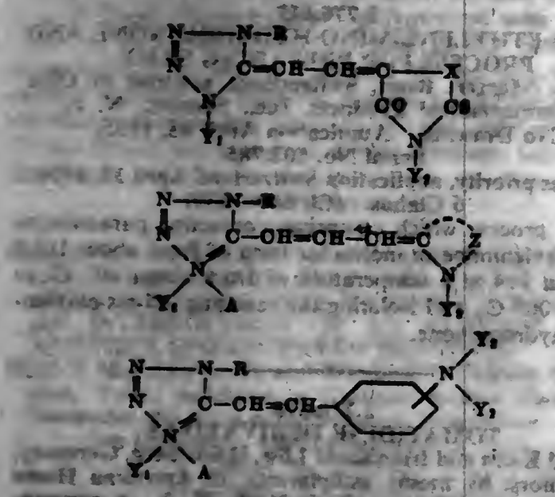
Ernst Schraufstätter, Wuppertal-Elberfeld, and Marianne Beck, Wuppertal-Sonnborn, Germany, assignors to Schenley Industries, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application November 12, 1953, Serial No. 391,768
7 Claims. (Cl. 260—240)

1. As a new chemical compound, a 5-acyl-7-tertiary aminomethyl-8-quinolinol of the general formula

in which Z is a member of the group consisting of a phenyl, benzyl, phenethyl, styryl, phenylbutadiene, furfurylidenemethyl, thienylidenemethyl, and quinolylidenemethyl radical, and in which X and Y are members of the group consisting of lower alkyl radicals, the sum total of carbon atoms of which does not exceed 14 and further members wherein, taken together with —N<, they form a saturated heterocyclic radical of the class consisting of piperidino and pyrrolidino.

---



2,770,620

## SENSITIZING DYESTUFFS

Adolf Steigler, Bad Soden am Taunus, Ludwig Berlin, Frankfurt am Main, and Heinrich Hensel, Okriftel, near Limburg (Lahn), Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Application January 18, 1955, Serial No. 482,673
Claims priority, application Germany January 21, 1954
7 Claims. (Cl. 260—240.4)

1. Sensitizing dyestuffs having a formula selected from the group consisting of the following three formulae:

wherein R represents a member of the group consisting of lower alkyl and phenyl, A represents a negative radical of an inorganic acid, X stands for a member selected from the group consisting of O, S, Se and N-alkyl, $Y_1$ and $Y_2$ stand for lower alkyls and Z represents the atoms necessary to complete a heterocyclic radical.

2,770,621

## PROCESS FOR THE PREPARATION OF 2-AMINO-4,6-DIPHENOXY-S-TRIAZINE

John A. Shotwell, St. Louis, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application December 21, 1954, Serial No. 476,893
3 Claims. (Cl. 260—249.9)

1. A process for the preparation of 2-amino-4,6-diphenoxy-s-triazine which comprises reacting molten 2,4,6-triphenoxy-s-triazine with gaseous ammonia at substantially atmospheric pressure.

---

2,770,622

## PROCESS FOR THE PRODUCTION OF 2,4-DIAMINO-6-CHLORO-S-TRIAZINE

Bert S. Gerber and Byron L. Williams, Texas City, Tex., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application December 30, 1954, Serial No. 478,876
5 Claims. (Cl. 260—249.8)

1. An improved process for the preparation of 2,4-diamino-6-chloro-s-triazine which comprises reacting cyanuric chloride and ammonia in an aqueous medium in the presence of a minor amount of a wetting agent selected from the group consisting of alkyl aryl sulfonates and condensation products of ethylene oxide with abietic acid, tall oil, alkyl phenols and alkyl mercaptans.

---

2,770,623

## THIAMINE HYDROCHLORIDE (VITAMIN $B_1$)

Robert Louis Herlan, Bound Brook, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application October 11, 1955, Serial No. 539,916
2 Claims. (Cl. 260—256.6)

1. A process of recovering thiamine hydrochloride from sulfate-free aqueous solution which comprises concentration at reduced pressure followed by azeotropic dehydration with β-ethoxy ethanol until the amount of water remaining is less than 10% by volume of the residual solvent and the amount of β-ethoxy ethanol remaining is less than 15 parts per part of thiamine hydrochloride but sufficient to maintain a filterable slurry.

---

2,770,624

## PREPARATION OF NEW THIAMINE SALTS

Isamu Utsumi, Yoshida, Sakyo-ku, Kyoto-shi, and Kiyoshi Harada, Otsu-shi, Shiga-ken, Japan, assignors to Gobisi Tanabe & Co., Ltd., Osaka, Japan, a corporation of Japan

No Drawing. Application June 15, 1954, Serial No. 437,008
11 Claims. (Cl. 260—256.6)

5. A thiamine di-higher molecular straight chain alkyl sulfate, wherein the alkyl sulfate moiety is a member selected from the class consisting of lauryl, myristyl, cetyl and stearyl sulfates.

---

2,770,625

## ANTHRAQUINONE DYESTUFFS

Fritz Baumann, Leverkusen-Bayerwerk, Germany, assignor to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Application July 19, 1954, Serial No. 444,351
Claims priority, application Germany July 21, 1953
5 Claims. (Cl. 260—281)

1. An anthraquinone dyestuff obtained by partial hydrolysis of a member selected from the group consisting of 1,4-diamino-anthraquinone-2,3-dinitrile chloro-substituted 1,4-diamino-anthraquinone-2,3-dinitrile and nitro-substituted 1,4-diamino-anthraquinone-2,3-dinitrile with sulfuric acid to form the carbaminide and reaction of said carbaminide with a member selected from the group consisting of benzidine, 1,8-naphthylene-diamine and β-anthramine.

4. Process for the production of anthraquinone dyestuffs, which comprises contacting a member selected from the group consisting of 1,4-diamino-anthraquinone-2,3-dinitrile, chloro-substituted 1,4-diamino anthraquinone-2,3-dinitrile, cyano-substituted 1,4-diamino-anthraquinone-2,3-dinitrile and nitro-substituted 1,4-diamino-anthraquinone-2,3-dinitrile with sulfuric acid at a temperature ranging from about 20°–35° C., recovering from the reaction mixture a hydrolysis product, heating said hydrolysis product with a member selected from the group consisting of benzidine, 1,8-naphthylene diamine and β-anthramine to a temperature ranging from about 150° to about 250° C. and recovering the anthraquinone dyestuff thus obtained from the reaction mixture.

---

2,770,626

## SOLUBILIZED 8-HYDROXYQUINOLINE AND METHOD OF PRODUCING SAME

Albright M. Nicholson, Warrensville, and Stanley B. Elliott, Shaker Heights, Ohio, assignors to Ferro Corporation, Cleveland, Ohio, a corporation

No Drawing. Application August 25, 1952, Serial No. 306,293
12 Claims. (Cl. 260—270)

1. The method of producing a composition of matter which consists of reacting at temperatures between 200° F. and the lowest decomposition temperature of the reactants, 8-hydroxyquinoline, with at least one water insoluble metal organic acid soap, said metal soap selected from the group consisting of the metal water insoluble soaps of stearic, palmitic, lauric, 2-ethyl-hexoic, linoleic, linolenic, oleic, ricinoleic, naphthenic, tall oil, rosin oil, rosin and abetic acids.

7. As a new composition of matter the product produced by claim 1.

---

2,770,627

## DESERPIDIOL AND SALTS THEREOF

Harold Bolling MacPhillamy, Middlesex, N. J., assignor to Ciba Pharmaceutical Products, Inc., Summit, N. J., a corporation of New Jersey

No Drawing. Application January 13, 1955, Serial No. 481,720
6 Claims. (Cl. 260—286)

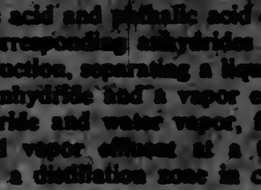
1. A member of the group consisting of deserpidiol and acid addition salts thereof.

---

2,770,628

## NONSUBSTITUTED PYRROLES AND PROCESS

Newman M. Bortnick, Philadelphia, and Milton F. Fegley, Mount Clare, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware



No Drawing. Application August 26, 1953, Serial No. 376,542
9 Claims. (Cl. 260—299.7)

1. A process for preparing N-substituted pyrroles which comprises reacting together between about 20° and 150° C. in liquid phase under the influence of an acidic catalyst giving in water at least the acidity of propionic acid a primary amine having an ionization constant of at least $4.6\times10^{-10}$ and a bis(tert-enolic)-1,3-butadiene of the structure

wherein $R^1$ and $R^2$ represent members of the class consisting of aliphatic hydrocarbon groups of not over four carbon atoms each and the benzyl group when taken individually and when taken together saturated divalent aliphatic chains which together with the nitrogen atom form a five- to six-sided heterocycle, $R^3$ and $R^4$ represent members of the class consisting of aliphatic hydrocarbon groups of not over four carbon atoms each and the benzyl group when taken individually and when taken together saturated divalent aliphatic hydrocarbon chains which together with the nitrogen atom form a five- to six-sided heterocycle, and $R^3$ and $R^4$ are members of the class consisting of hydrogen, alkyl groups of not over eight carbon atoms, and phenyl groups.

8. Pyrroles of the formula

wherein A is an alkylene chain of two to three carbon atoms.

---

2,770,629

## PREPARATION OF PHTHALOCYANINE PIGMENTS

John W. Eastes, Somerville, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine

Application January 8, 1952, Serial No. 265,523
20 Claims. (Cl. 260—314.5)

1. The method of producing a finely-divided, tinctorially strong, non-crystallizing, red shade, beta form metal phthalocyanine pigment which comprises slurrying a phthalocyanine crude pigment prepared in an autoclave in a saturated aliphatic hydrocarbon solvent, in an aqueous medium comprising sulfuric acid, the sulfuric acid concentration being between about 62.5% and about 80%, drowning the pigment-acid slurry in water, separating the pigment, and neutralizing acid remaining in the pigment.

---

2,770,630

## RECOVERY OF MALEIC ANHYDRIDE

Stuart P. Miller, Scarsdale, N. Y., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York

Application March 12, 1952, Serial No. 276,982
7 Claims. (Cl. 260—346.8)

1. The process of recovering maleic anhydride from a dilute aqueous liquor containing maleic acid and phthalic acid which comprises concentrating said liquor by submerged combustion evaporation of water at 98–110° C., whereby formation of fumaric acid is minimized, mixing the resulting concentrate with a large excess by weight of molten phthalic anhydride, passing the molten mixture rapidly through a dehydrating zone at a temperature of 170–250° C. to convert a substantial proportion of the maleic acid and phthalic acid content of said mixture to the corresponding anhydrides with minimum fumaric acid production, separating a liquid effluent containing phthalic anhydride and a vapor effluent containing maleic anhydride and water vapor, feeding at least a portion of said vapor effluent at a temperature of 165–240° C. into a distillation zone in contact with an alkylated benzene selected from the group consisting of trimethyl, methyl ethyl and propyl benzenes and xylenes, distilling water and said alkylated benzene out of said zone in the form of a water-alkylated benzene azeotrope, condensing maleic anhydride out of the vapors in said distillation zone and recovering said maleic anhydride as product.

2,770,631

## HYDROXYESTER SUBSTITUTED SILOXANES

Robert L. Merker, Pittsburgh, Pa., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Application May 20, 1954, Serial No. 431,297
11 Claims. (Cl. 260—448.2)

1. A siloxane having the unit formula

$$[(OH)_nRCOOCH_2]R'_nSiO_{\frac{3-n}{2}}$$

in which R is a polyvalent hydrocarbon radical, R' is a monovalent hydrocarbon radical, $n$ has a value of from 1 to 2 inclusive and $x$ has a value of at least 1.

2,770,632

## CARBOXYESTER SUBSTITUTED SILOXANES

Robert L. Merker, Pittsburgh, Pa., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Application May 20, 1954, Serial No. 431,296
12 Claims. (Cl. 260—448.2)

1. A siloxane having the unit formula

$$[HOOCRCOOCH_2]R'_nSiO_{\frac{3-n}{2}}$$

in which R is selected from the group consisting of divalent hydrocarbon radicals and hydroxylated divalent hydrocarbon radicals, R' is a monovalent hydrocarbon radical and $n$ has an average value from 1 to 2 inclusive.

2,770,633

## ORGANOSILICON ESTERS

Lee H. Sommer, State College, Pa., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Application October 28, 1953, Serial No. 388,919
8 Claims. (Cl. 260—448.2)

1. A compound of the formula

$$RCO_2(CH_2)_mSiO[SiO]_nSi(CH_2)_mO_2CR$$

where R is a monovalent hydrocarbon radical, $n$ is an integer from 3 to 18 and $m$ has a value of at least one.

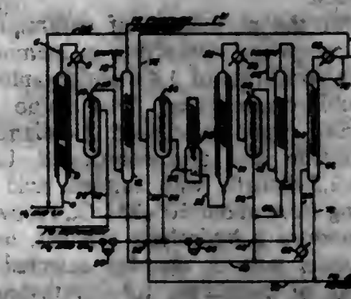
2,770,634

## METHOD OF PRODUCING VINYLCHLOROSILANES

Donald R. Weyenberg, Midland, Mich., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Application July 17, 1953, Serial No. 368,823
5 Claims. (Cl. 260—448.2)

1. A method of preparing vinylchlorosilanes which comprises, heating a mixture of vinylchloride and a chlorosilane of the formula $R_aSiHCl_{3-a}$, where R is selected from the group consisting of alkyl radicals of less than 5 C atoms and phenyl radicals and $a$ has a value from 0 to 1 inclusive, at a temperature of from 550° C. to 650° C. for at least two seconds at a pressure below three atmospheres.



2,770,635

## PRODUCTION OF ALCOHOLS AND ORGANIC ACIDS FROM OXYGENATED ORGANIC COMPOUNDS

Karel L. Hijzek and Richard Mangan, Tulsa, Okla., assignors to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

Application December 7, 1953, Serial No. 396,624
9 Claims. (Cl. 260—450)

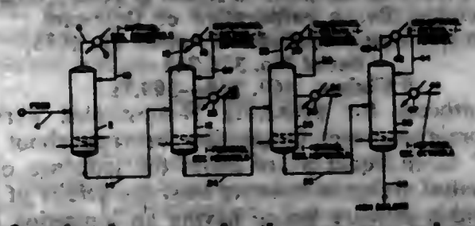
3. A process for increasing the proportion of one of the classes of oxygenated organic compounds selected from the group consisting of alcohols and acids present in a mixture of aldehydes and ketones, which comprises subjecting said mixture to the action of a gaseous mixture consisting essentially of hydrogen and carbon dioxide in

the presence of a hydrocarbon synthesis catalyst, the minimum molar ratio of carbon dioxide to hydrogen being approximately within the range of conditions defined below, where an increase in the proportion of acids is desired:

| Pressure, p. s. i. | Temperature, ° C. | $CO_2$:$H_2$ |
|---|---|---|
| 400 | 180 | 3:1 |
| 450 | 315 | 5:1 |
| 200 | 315 | 4:1 |
| 200 | 180 | 2:1 |

the maximum molar carbon dioxide-hydrogen ratio being approximately within the ranges of conditions defined below where an increase in the proportion of alcohols is desired:

| Pressure, p. s. i. | Temperature, ° C. | $CO_2$:$H_2$ |
|---|---|---|
| 450 | 180 | 1:1 |
| 450 | 315 | 3:1 |
| 200 | 315 | 2:1 |
| 200 | 180 | 1:2 |



whereby aldehydes, ketones and at least about 25 weight percent of the acids are converted into alcohols, and thereafter recovering a mixture in which one of said oxygenated organic compounds selected from the group consisting of alcohols and acids is present in increased ratio to the other components of the mixture recovered.

## METHOD FOR PURIFICATION OF OIL-SOLUBLE ALCOHOLS

Alfred Stoltz, Jr., Tulsa, Okla., assignor to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

Application October 18, 1952, Serial No. 315,448
9 Claims. (Cl. 260—450)

1. In a batch process for the recovery and purification of preferentially oil-soluble straight chain alcohols present in a mixture consisting essentially of said straight chain alcohols and branched chain alcohols of corresponding carbon content together with objectionable concentrations of hydrocarbon contaminants wherein said mixture is obtained by first extracting hydrocarbon synthesis oil with an aqueous solution of a substantially nonsurface-active salt of a preferentially oil-soluble carboxylic acid to obtain an extract contaminated with objectionable amounts of hydrocarbons, thereafter subjecting the resulting extract to distillation to obtain a distillate containing oil-soluble carbonyl compounds and alcohols, said distillate being free from said salt solution but containing hydrocarbon contaminants, and topping said distillate to a temperature of from about 95° to about 110° C. whereby an appreciable quantity of said hydrocarbons is removed overhead together with some alcohols and carbonyls, the steps which comprise subjecting the resulting residue, which still contains an objectionable concentration of hydrocarbons, to reducing conditions whereby the carbonyl compounds present therein are substantially completely converted to their corresponding alcohols, introducing the resulting reduced residue into the distillation zone of a column under fractional distillation conditions of elevated temperature and reduced pressure and separately collecting as distillate alternate fractions of highly purified straight chain alcohols and of branched alcohols containing hydrocarbons in concentrations substantially greater than the concentration of said hydrocarbons present in said mixture.

2,770,637

## PRODUCTION OF OXYGENATED HYDROCARBONS

Robert L. Mitchell and Oren V. Lyle, Corpus Christi, Tex., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware

No Drawing. Application September 4, 1952, Serial No. 307,908
2 Claims. (Cl. 260—461)

1. In a process for the production of oxygenated hydrocarbons by the vapor phase partial oxidation of normally gaseous saturated aliphatic hydrocarbon materials at a pressure of between about 20 and 300 pounds per square inch wherein a main stream comprising a reaction mixture containing oxygen and said hydrocarbon materials, said mixture containing between about 2 and 25 mole percent oxygen on the hydrocarbons, is heated to an elevated temperature of about 500° to 700° F. and below that at which the oxidation reaction will take place in an uncontrolled manner and the oxidation reaction proceeds at a rapid rate after an induction period of about 0.5 to 5 seconds, the improvement which comprises introducing into the main stream an auxiliary stream comprising an alkyl peroxide which will decompose to liberate free radicals at the temperature reached by the reaction mixture during the induction period in an amount sufficient to yield a concentration of at least about 0.05 volume percent on the volume of the main stream, said substance being essentially the sole added reaction promoter in said reaction mixture.

2,770,638

## XANTHYL AND TRITHIOCARBONYL SULFONES AS NOVEL COMPOSITIONS OF MATTER

Silvio L. Giolito, New York, N. Y., and Robert H. Jones, Atlanta, Ga., assignors to Stauffer Chemical Company, a corporation of California

No Drawing. Application July 3, 1953, Serial No. 366,955
6 Claims. (Cl. 260—455)

1. As a new composition of matter, a compound having the formula:

$$(RXCS)_2SO_2$$

wherein X is chosen from the group consisting of sulfur and oxygen, and R is an alkyl radical having from one to twelve carbon atoms.

2,770,639

## METHOD OF PRODUCING ALIPHATIC AND ALICYCLIC CARBONATES

Robert J. Slocombe, Dayton, Ohio, and Edgar E. Hardy and James H. Saunders, Anniston, Ala., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application January 17, 1955, Serial No. 482,422
10 Claims. (Cl. 260—463)

1. The method of producing aliphatic and alicyclic carbonates, which comprises reacting together while substantially completely in the vapor phase, phosgene and a compound selected from the group consisting of unsubstituted primary and secondary aliphatic and alicyclic monohydric alcohols which boil at atmospheric pressure without substantial decomposition, said reactants being employed in a phosgene/alcohol molar ratio of from about 1:2 to about 1:10 and said reaction being carried out at a temperature above the boiling point of said alcohols but below the temperature at which substantial decomposition of said carbonates takes place during the time allowed for the reaction.

2,770,640

## CYANOETHYLATION OF KETONES

Glen E. Journeay, Texas City, Tex., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application September 23, 1954, Serial No. 458,805
17 Claims. (Cl. 260—464)

1. A process for the cyanoethylation of ketones which comprises reacting $\beta,\beta'$-oxydipropionitrile with a ketone having at least one active hydrogen atom attached to a carbon atom adjacent to the ketonic carbonyl group in the presence of a strongly alkaline catalyst.

2,770,641

## PREPARATION OF BENZONITRILE

Charles H. McKeever, Meadowbrook, and Joseph W. Nemec, Philadelphia, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application August 13, 1954, Serial No. 449,784
2 Claims. (Cl. 260—465)

1. A process for preparing benzonitrile which comprises charging to a reaction zone in a reaction system benzonitrile in an amount to fill a fraction of said zone, supplying to said zone a dehydration catalyst, heating the charged benzonitrile until vapors thereof pass through a fractionating zone to a condensing zone where the vapors are condensed with reflux of benzonitrile, passing into the reaction zone benzoic acid and ammonia in molecular excess of the said acid while maintaining reflux of the benzonitrile, heating the reaction zone until the contents thereof are between 200° and 250° C. and the vapor temperatures at the head of the fractionating zone are maintained between 125° and 175° C. while addition of benzoic acid and ammonia is continued, taking off benzonitrile and water while maintaining reflux of benzonitrile and water.

2,770,642

## PREPARATION OF BETA-HYDROXY-BETA-PHENYL-PROPIONITRILE AND CINNAMONITRILE

Robert S. Montgomery, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

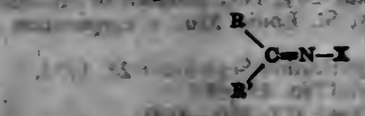
No Drawing. Application May 11, 1953, Serial No. 354,625
4 Claims. (Cl. 260—465)

1. A method which comprises heating beta-hydroxy-beta-phenylpropionitrile with a strong alkali of the class

consisting of the alkali metal hydroxides and the alkali metal alkoxides, the alkali being present in an amount corresponding to from 0.5 to 5.0 parts by weight as alkali metal hydroxide per 100 parts of the beta-hydroxy-beta-phenylpropionitrile, in the presence of a lower saturated aliphatic alcohol, removing the alcohol by distillation and distilling cinnamonitrile from the reaction mixture at a pressure corresponding to a distillation temperature of from about 100° C. to about 150° C.

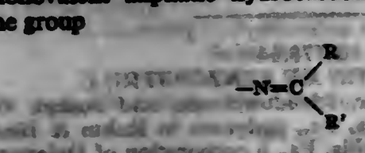
---

2,770,643



## SYNTHESIS OF ALIPHATIC NITRILES BY PYROLYSIS AND THERMAL CLEAVAGE OF HYDRAZONES, KETAZINES, KETIMINES AND KETOXIMES

John L. Anderson, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware



No Drawing. Application November 5, 1953, Serial No. 390,420

12 Claims. (Cl. 260—465.1)

1. Process for obtaining aliphatic nitriles which comprises pyrolyzing and thermally cleaving in the absence of a catalyst at a temperature within the range of 400 to 1000° C. a compound of the general formula

wherein R and R' are selected from the class consisting of acyclic aliphatic radicals and aliphatic radicals which together with the carbon atom to which they are attached form a cycloaliphatic radical and X is selected from the class consisting of hydrogen, hydroxyl, alkoxy, acyloxy, monovalent aliphatic hydrocarbon radicals, amino and the group

wherein R and R' are defined as aforesaid, and condensing the pyrolysis products containing aliphatic nitrile of a lesser number of carbon atoms than the unpyrolyzed compound.

---

2,770,644

## PURIFICATION OF ACRYLONITRILE

Marvin L. Owens, Jr., Texas City, Tex., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application December 29, 1954, Serial No. 478,541

5 Claims. (Cl. 260—465.9)

1. A process for the purification of acrylonitrile containing methyl vinyl ketone which comprises treating said acrylonitrile with a minor amount of hydroxylamine hydrochloride.

---

2,770,645

## PURIFICATION OF ACRYLONITRILE

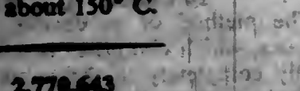
David W. McDonald, Texas City, and Keith M. Taylor, La Marque, Tex., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application December 29, 1954, Serial No. 478,496

7 Claims. (Cl. 260—465.9)

1. A process for the purification of acrylonitrile containing methyl vinyl ketone which comprises treating said acrylonitrile with a minor amount of a compound selected from the group consisting of the alkali metal, the alkaline earth metal and ammonium bisulfites.

2,770,646



## QUATERNARY AMMONIUM COMPOUNDS OF BASIC ESTERS OF 2-ARYL-2-(1-HYDROXYCYCLOHEXYL) ETHANOIC ACIDS

Gino R. Treves, New York, N. Y., assignor to Schieffelin & Co., New York, N. Y., a corporation of New York

No Drawing. Application April 18, 1951, Serial No. 221,752

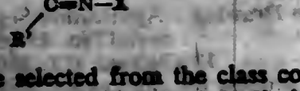
15 Claims. (Cl. 260—473)

1. The compound:

in which A is a group selected from the class consisting of 1-hydroxycyclohexyl and alkyl-substituted 1-hydroxycyclohexyl groups, *n* is a whole number varying from 1 to 6, M is a quaternary ammonium salt moiety, and B is a radical selected from the class consisting of phenyl and alkoxyphenyl radicals, said alkyl and alkoxy groups each containing 1 to 6 carbon atoms.

---

2,770,647



## QUATERNARY AMMONIUM COMPOUNDS OF BASIC ESTERS OF 2-ARYL-2-(1-HYDROXYCYCLOPENTYL) ETHANOIC ACIDS

Gino R. Treves, New York, N. Y., assignor to Schieffelin & Co., New York, N. Y., a corporation of New York

No Drawing. Application April 18, 1951, Serial No. 221,751

14 Claims. (Cl. 260—473)

1. The compound:

in which A is a group selected from the class consisting of 1-hydroxycyclopentyl and alkyl-substituted 1-hydroxycyclopentyl groups, *n* is a whole number varying from 1 to 6, M is a quaternary ammonium salt moiety, and B is a radical selected from the class consisting of phenyl and alkoxyphenyl radicals, said alkyl and alkoxy groups each containing 1 to 6 carbon atoms.

---

2,770,648

## PREPARATION OF HYDROXYBENZOIC ESTERS BY ALCOHOLYSIS

Jack Vair Scharmann, New York, N. Y., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application January 13, 1953, Serial No. 331,121

6 Claims. (Cl. 260—474)

1. An alcohol exchange process for the preparation of a higher ester of an o-hydroxybenzoic acid substantially free of phenol which comprises forming a mixture of a low boiling ester of an o-hydroxybenzoic acid and a monohydric alcohol having up to 4 carbon atoms, an aliphatic alcohol having a boiling point of at least 150° C., and an alkaline catalyst, heating said mixture to a temperature sufficient to cause alcohol exchange and to distill said monohydric alcohol out of said mixture, conducting said heating in the presence of an inert gas from the group consisting of nitrogen and carbon dioxide to inhibit formation of phenol, thereby forming a higher boiling ester of said o-hydroxybenzoic acid and aliphatic alcohol substantially free of phenol.

---

2,770,649

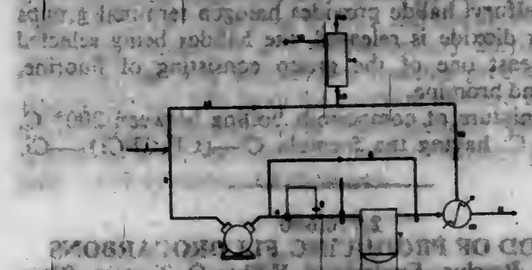
## o-METHOXYPHENOXY-2-HYDROXY-PROPYL CARBAMATES

Robert S. Murphey, Richmond, Va., assignor to A. H. Robins Company, Inc., Richmond, Va.

No Drawing. Application June 22, 1955, Serial No. 517,387

3 Claims. (Cl. 260—482)

1. A compound selected from the group consisting of 3-o-methoxyphenoxy-2-hydroxy-propyl carbamate and N-lower alkyl derivatives thereof.



2,770,650

## PROCESS FOR THE PRODUCTION OF VINYL ESTERS

Walter H. Stanton, Texas City, Tex., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Application January 26, 1953, Serial No. 333,249

4 Claims. (Cl. 260—498)

1. A process for the production of vinyl esters which comprises the following steps: compressing an acetylene-containing gas stream by means of a constant-output compressor; combining a predetermined portion thereof as it comes from the compressor with a quantity of vaporized aliphatic monocarboxylic acid and passing said combined stream into a catalytic reactor; injecting the remainder of said acetylene-containing stream into the product gas stream emerging from the reactor and passing said mixed gas stream into a condenser where the vinyl ester is condensed; recycling the acetylene and other noncondensable gases to the compression step; venting a portion of said recycled gases through a scrubber where the carboxylic acid is employed as the scrubbing agent to remove acetylene; and purifying the condensed ester by conventional distillation techniques.

---

2,770,651

## PREPARATION OF 2-METHYL-4 CHLOROPHENOXY-ACETIC ACID

Alex Hlynsky, Painesville, Ohio, assignor to Diamond Alkali Company, Cleveland, Ohio, a corporation of Delaware

No Drawing. Application April 27, 1954, Serial No. 426,638

7 Claims. (Cl. 260—521)

1. The method of preparing 2-methyl-4-chlorophenoxy-acetic acid comprising the steps of reacting orthocresol and chloracetic acid in an alkaline medium, adjusting the pH of the reaction mass to a value within the range of about 7.0 to 9.0, cooling the reaction mass to a temperature less than about 10° C., and adding to the reaction mass a mixture of an alkali metal hydroxide and chlorine in amounts sufficient to produce in solution a chlorinating quantity of hypochlorite ion, and thereafter removing the chlorinated product.

---

2,770,652

## POLYFLUORO-ETHERS OF OXIMES AND PREPARATION THEREOF

David Charles England, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 1, 1955, Serial No. 512,565

12 Claims. (Cl. 260—566)

1. A process for the manufacture of polyfluoroethers of oximes which comprises reacting a polyhalogenomonoolefin, having the ethylenic linkage a terminal one and having at least three halogens on doubly bonded carbon, at least one of said halogens being fluorine and having any singly bonded carbon externally joined only to fluorine, with the alkali metal salt of the oxime of a monooxohydrocarbon of from 2 to 18 carbon atoms which is free from non-aromatic unsaturation, hydrolyzing the resulting compound and extracting the oxime ether.

6. The O-polyhalogenoalkyl ether of the oxime of a monooxohydrocarbon of from 2 to 18 carbon atoms and free from non-aromatic unsaturation, the polyhalogenoalkyl radical containing one hydrogen on the β carbon atom, at least one fluorine on the β carbon atom, only fluorine on any further carbons and with any remaining valence of the α carbon atom bonded to halogens of atomic number up to 17 and of the β carbon atom to fluorine.

---

2,770,653

## DIARALKYL-ALKYLENEDIAMINE PREPARATION

Roy S. Hanslick, Philadelphia, and Richard Regnah, Ormond, Pa., assignors to American Phenol Products Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application March 9, 1955, Serial No. 493,256

6 Claims. (Cl. 260—570.9)

1. The process comprising reacting a diamine having the formula R—CH=N·alk·N=CH—R with a halide of the formula $R_1$·Hal in the presence of an alcohol of 2 to 8 carbon atoms, said reactants being in a molar ratio, diamine:halide:alcohol of at least 1:2:4, the reaction being carried out under substantially anhydrous conditions and at a temperature in the range of 75° to about 225° C., R in the above formulae standing for a member of the group consisting of alkyl of not more than 17 carbon atoms, phenyl, methoxyphenyl and furfuryl radicals, while $R_1$ represents a member of the group consisting of benzyl, alpha-methylbenzyl and beta-phenylethyl, "Hal" 4. The process comprising reacting N,N'-dibenzal-ethylenediamine with bezyl chloride and n-hexyl alcohol under substantially anhydrous conditions and at the refluxing temperature of the alcohol, the molar proportions of diamine:halide:alcohol being at least 1:2:4.

---

2,770,654

## CATALYTIC REGENERATION OF PHENYLACETALDEHYDE FROM ITS TRIMER

Walter B. Trapp, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application November 19, 1953, Serial No. 393,248

4 Claims. (Cl. 260—599)

1. The method which comprises heating 2,4,6-tribenzyl-s-trioxane to a temperature in the range from 90° to 160° C. at an absolute pressure of not to exceed 15 millimeters of mercury, in contact with a catalyst which is an earth having an acidity factor in the range from —10 to 100, and withdrawing the so-regenerated phenylacetaldehyde from the heated zone as formed.

---

2,770,655

## PROCESS FOR THE PRODUCTION OF BRANCHED CARBON CHAIN ALDEHYDES

Karl Mönkemeyer, Marl, Kreis Recklinghausen, Germany, assignor to Chemische Werke Hüls Aktiengesellschaft, Marl, Kreis Recklinghausen, Germany, a corporation of Germany

No Drawing. Application March 26, 1954, Serial No. 419,084

Claims priority, application Germany May 27, 1953

2 Claims. (Cl. 260—603)

1. A process for the production of branched carbon chain aldehydes which comprises reacting an aliphatic tertiary alcohol with carbon monoxide and hydrogen in the presence of a cobalt catalyst at an elevated temperature within the range from about 100° to about 300° C. and under a pressure within the range from about 200 to about 1000 atmospheres absolute in the presence of water within the range from about 5 to about 50 percent, based upon the weight of the starting alcohol.

2,770,656
PREPARATION OF ETHYLENE GLYCOL
David J. Pye, Concord, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Application June 5, 1953, Serial No. 359,969
13 Claims. (Cl. 260—635)

1. A catalytic vapor phase process for hydrating ethylene oxide to ethylene glycol which comprises passing a vapor phase mixture of water and less than an equimolecular proportion of ethylene oxide over a catalyst comprising a normal calcium ortho phosphate at a reaction temperature below 500° C.

2,770,657
NITROGEN DIOXIDE COMPOUNDS OF 1,3-DICHLORO-2-BUTENE, AND COMPOSITIONS CONTAINING THE SAME
Jack Raymond Hively, Clarksville, Ind., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application February 11, 1953, Serial No. 336,441
6 Claims. (Cl. 260—644)

1. A process for preparing a stable nitrogen-containing derivative of 1,3-dichloro-2-butene which comprises reacting 0.003 to 0.74 part of nitrogen dioxide with 1 part of 1,3-dichloro-2-butene at temperatures of from −30° to +125° C.

4. A chloro-1,3-butadiene compound of the group consisting of 2-chloro-1,3-butadiene and 2,3-dichloro-1,3-butadiene stabilized against the growth of granular polymers by containing a 1,3-dichloro-2-butene–nitrogen dioxide reaction product obtained by the process of claim 1 in an amount sufficient to give in the chloro-1,3-butadiene solution from 0.001% to 1.0% of combined $NO_2$.

2,770,658
PROCESS FOR THE MANUFACTURE OF BENZENE HEXACHLORIDE
Ford R. Lowdermilk, Gwynedd Valley, and Everett A. Bruce, Paoli, Pa., assignors to The Pennsylvania Salt Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Application November 4, 1952, Serial No. 318,753
8 Claims. (Cl. 260—648)

1. In a process for the recovery of a water immiscible organic liquor adhering to benzene hexachloride solids, the steps comprising washing the benzene hexachloride solids containing adhering water immiscible organic liquor with an aqueous solution of an organic wetting agent at a temperature at which both the water immiscible organic liquor and the wash water remain liquid, thereafter withdrawing a mixture of water immiscible organic liquor and the said aqueous solution of the organic wetting agent from contact with said solids and separating the said organic liquor from the said aqueous solution.

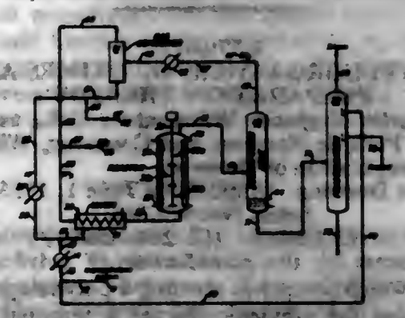
2,770,659
TELOMERIZATION WITH SULFURYL HALIDE AND PRODUCT THEREOF
William S. Barnhart, Cranford, N. J., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware
No Drawing. Application June 19, 1952, Serial No. 294,095
20 Claims. (Cl. 260—653)

1. A process for the production of a distillable open chain compound having a general formula selected from the group consisting of

$$W—(X)_n—W \text{ and } W—(X)_n(Y)_m—W$$

in which X is a haloolefin and Y is a different haloolefin, W is a halogen selected from the group consisting of fluorine, chlorine and bromine and $n$ and $m$ are integers at least one being greater than 1 which comprises reacting a polymerizable compound containing a double bond between two carbon atoms and at least one halogen atom attached to at least one of the carbon atoms of the double bond under liquid phase and substantially anhydrous conditions in the presence of a sulfuryl halide such that the sulfuryl halide provides halogen terminal groups and sulfur dioxide is released, the halides being selected from at least one of the group consisting of fluorine, chlorine and bromine.

18. A mixture of compounds boiling between 200° C. and 550° C. having the formula $Cl—(CF_2CFCl)_n—Cl$.

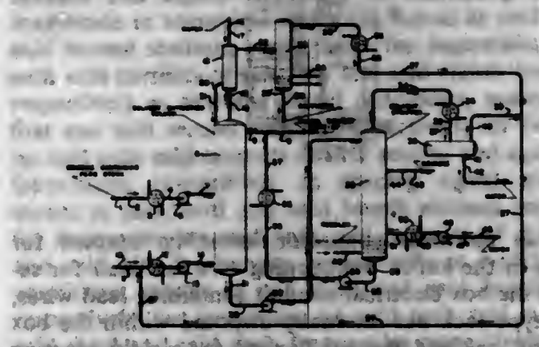


2,770,660
METHOD OF PRODUCING FLUOROCARBONS
Herbert J. Passino, Englewood, Wilbur O. Teeters, River Edge, and Russell M. Mantell, Orange, N. J., assignors to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware
Application February 11, 1952, Serial No. 271,916
9 Claims. (Cl. 260—653)

1. A process which comprises reacting a fluidized mass of finely divided carbon particles with fluorine as substantially the sole halogen at a temperature of about 375° to about 925° F. in the presence of between 8 percent and 12 percent by weight of an inorganic metal halide.

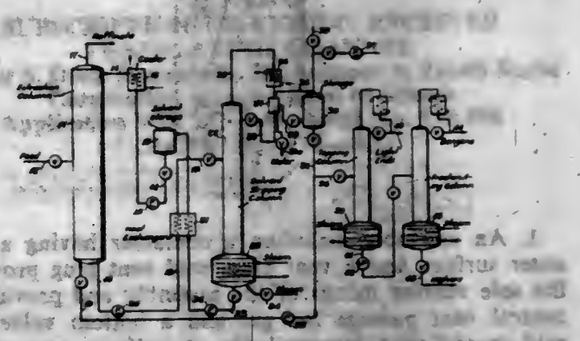
2,770,661
PRODUCTION OF CHLORINATED COMPOUNDS
Theodore Herlenko, Frank B. Marcotte, and Owen V. Lake, Corpus Christi, Tex., assignors to Celanese Corporation of America, New York, N. Y., a corporation of Delaware
No Drawing. Application August 11, 1953, Serial No. 373,685
8 Claims. (Cl. 260—658)

1. In the process for the production of addition products by the reaction of ethylene and carbon tetrachloride under pressure in the presence of free radicals, the improvement which comprises saturating the carbon tetrachloride with oxygen, then purging said saturated carbon tetrachloride with a gas for a predetermined period of time in order to remove a portion only of the oxygen therefrom, and then effecting the reaction of said purged carbon tetrachloride with ethylene.



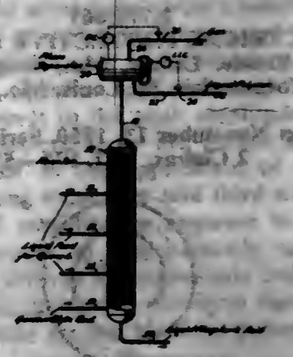
2,770,662
HF-$BF_3$ TREATING OF SECONDARY ALKYLTOLUENES
David A. McCauley, Chicago, Ill., and Arthur P. Lien, Highland, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application October 30, 1953, Serial No. 389,380
6 Claims. (Cl. 260—668)

1. A process which comprises contacting, under substantially anhydrous conditions, a charge consisting essentially of at least one isomer of a single secondary alkyltoluene selected from the class consisting of isopropyltoluene and secondary butyltoluene with at least one mol of $BF_3$ per mol of secondary alkyltoluene charged and at least sufficient liquid HF to participate in complex-formation and to dissolve said charge to form a single essentially homogeneous liquid phase, at a temperature between about −20° C. and about +30° C. for a permissible maximum time of about 5 minutes at +30° C. and several days at −20° C., the lower the temperature of contacting, the longer the corresponding permissible maximum time, said conditions of time and temperature resulting in the formation of 3,5-di-secondary alkyltoluene as essentially the only alkyltoluene reaction product, removing the HF and $BF_3$ from the reaction mixture under conditions to substantially avoid rearrangement reactions and recovering from said reaction product mixture essentially pure 3,5-di-secondary alkyltoluene.



2,770,663
SOLVENT EXTRACTION OF HYDROCARBONS
Henry W. Grote, Hinsdale, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application July 30, 1952, Serial No. 301,778
4 Claims. (Cl. 260—674)

1. A process for producing an aromatic concentrate from a reformed gasoline product which comprises separating from the reformed product a light paraffinic fraction boiling between about 40° C. and about 65° C. and a heavier fraction containing aromatic and paraffinic hydrocarbons, countercurrently contacting said heavier fraction with an aqueous polyoxy-polyalkylene glycol solvent for aromatics in an extraction zone, thereby forming a paraffinic raffinate and an aromatic extract containing a small amount of relatively heavy paraffins, countercurrently contacting said extract in said zone with a quantity of said light paraffinic fraction in excess of that required to displace from the extract said small amount of relatively heavy paraffins, removing the excess of said light fraction from said zone in admixture with said raffinate, distilling the withdrawn raffinate to separate said excess of light paraffinic hydrocarbons therefrom and returning the latter to said zone for further countercurrent contact with the extract therein, and distilling light paraffins from said extract and returning the same to the extraction zone together with the light paraffins separated from said raffinate.

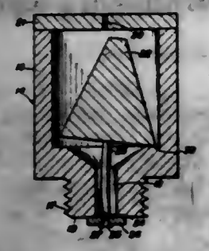


2,770,664
AROMATIC HYDROCARBONS BY SOLVENT EXTRACTION WITH A SOLVENT OF DIETHYLENE GLYCOL AND WATER
Leo H. Horsley, Victor S. Morello, and Noland Poffenberger, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Application November 9, 1951, Serial No. 255,686
7 Claims. (Cl. 260—674)

1. A continuous process for isolating benzene in a substantially pure state from the liquid hydrocarbon product of the vapor-phase catalytic reforming and cyclization in the presence of hydrogen of a gasoline fraction containing mainly hydrocarbons of six and seven carbon atoms per molecule, such product containing at least 10 percent by weight of benzene and an appreciable proportion of olefins not exceeding about 3 percent, which comprises introducing a stream of the hydrocarbon product into a counterflow multistage extraction system near the middle, introducing a stream of diethylene glycol containing 0.5 to 10 percent by weight of water into one end of the system into extractive contact with the hydrocarbon phase therein, withdrawing a stream of substantially

aromatic hydrocarbon-free raffinate containing part of the olefins from the system at the same end, withdrawing a stream of benzene-containing extract containing the other part of the olefins from the other end of the system, subjecting the extract to evaporative conditions to distill a benzene-rich hydrocarbon portion therefrom, returning part of the said separated hydrocarbon portion as a reflux stream to the extraction system at this other end, and subjecting the remainder of the separated hydrocarbon portion to fractional distillation to separate the olefins therefrom and to isolate the benzene therein in a substantially pure state.

2,770,665
POLYMERIZATION PROCESS FOR PREPARING PROPYLENE TETRAMER
Lawrence H. Cook, Canonsburg, Pa., assignor to Gulf Oil Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application September 12, 1952, Serial No. 309,333
2 Claims. (Cl. 260—683.15)



1. The method of bonding a polyamide layer to a polyvinyl chloride layer which comprises depositing on the polyvinyl chloride layer a first intermediate layer of a solution of a substance selected from the group consisting of a polyacrylic acid ester and a polymethacrylic acid ester, depositing on said first intermediate layer a second intermediate layer of a substance selected from the group consisting of nitrocellulose and polyvinyl acetate, and depositing on said second intermediate layer the polyamide layer.

# ELECTRICAL

## 2,770,666
## STORAGE BATTERY WITH VENT PLUG

Milton A. Knight, Centreville, Va.

Application May 11, 1955, Serial No. 507,755
9 Claims. (Cl. 136—178)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. An assembly including a container having a hard outer surface and a vent plug, said vent plug providing the sole venting means of the assembly and providing a central vent passage for gas and a bottom valve seat, said central vent passage being of uniform cross-section along its lower portion and providing an opening of the same uniform cross-section through and at right angles to the bottom valve seat, a vent control dual valve having a tiltable weight portion within the plug and a pivotable valve stem which is secured to the weight and passes through the vent passage, said valve stem extending below the valve seat and having a reduced portion spaced from but near its lower end, a circular disc valve of uniform cross-section surrounding a portion of the reduced portion and being supported from below by the valve stem and limited to movement axially of the valve stem by the length of the reduced portion, said disc having a central opening which is larger than the reduced portion so that the dual valve will be partially open when the disc is positioned above the supporting portion of the valve stem, said supporting portion being smaller in cross-section than the vent passage at the valve seat so that it will not press on the disc directly below the valve seat, and said disc being sufficiently rigid against flexing that its outer portion will maintain a seat on the valve seat when the weight is tilted and the valve is completely closed.

## ELECTRICAL PROTECTIVE DEVICES

Kenneth R. Runde, Lemay, Mo., assignor to James R. Kearney Corporation, St. Louis, Mo., a corporation of Missouri

Application November 13, 1950, Serial No. 195,360
2 Claims. (Cl. 174—5)

1. A protective device comprising an elongated body which is formed by a single sheet of relatively rigid electrical insulating material shaped to provide said elongated body with a wall portion extended substantially spirally thereof and spaced apart to provide a substantially spiral passageway having an entrance leading to a central space within said elongated body to admit a conductor from the exterior to said central space, the convolutions of said spiral wall being spaced apart a distance at least equal to the diameter of the conductor, said space within said elongated body having a top wall, portions of which are inclined to provide a seat for a conductor extended through said central space so that said elongated body may be centered in a suspended position with respect to said conductor when in use, and a part on said elongated body for connection with a handle.

## 2,770,668
## LOCK NUT BUSHING FOR ELECTRICAL CONNECTORS

Arthur I. Appleton, Northbrook, Ill.

Application January 7, 1955, Serial No. 480,414
2 Claims. (Cl. 174—137)

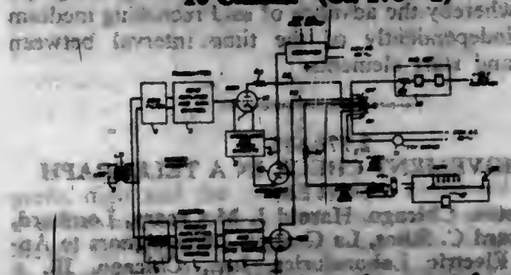
2. In an electrical connector assembly adapted for mounting in the knock out opening of a box wall for securing to the box electrical conduit containing lead wires, a sleeve type lock nut internally disposed within the box and having one end thereof flanged for rigidly securing the assembly to the box, the other end of said lock nut provided with a plurality of staked-out portions about its outer periphery, and an annular bushing of hard insulating material for fitting over said staked-out portions, said staked-out portions acting to bite into said bushing and thereby retain the bushing positively on said lock nut for insulating the lead wires from contact with the lock nut.

## 2,770,669
## MULTIPLE SOLDER-SEAL BUSHING

Baynard R. Smith, Matawan, N. J., assignor to Stanlite Research Corporation, Keasbey, N. J., a corporation of Delaware

Application January 26, 1953, Serial No. 333,323
5 Claims. (Cl. 174—152)

5. A sealed terminal structure comprising a metal wall having an opening therein and an insulating bushing having a unitary body of insulating material, said body of the insulating bushing having a lower portion adapted to snugly fit into said opening in said wall, and an enlarged upper portion, a shoulder at the area where the lower portion and the upper portion of said body are joined together, said shouldered area comprising at least one endless groove extending about the same with flat surfaces on each side thereof and a solder seal between each of said flat areas and the contacting area of said wall.



## 2,770,670
## CARRIER TELEGRAPH SWITCHBOARD SUPERVISORY SYSTEM

Leland A. Gardner and John L. Hyslop, Summit, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application May 9, 1952, Serial No. 286,996
10 Claims. (Cl. 178—3)

9. A frequency shift telegraph system having, a telegraph path, a first and a second telegraph station connected to a first end of said path, a third and a fourth telegraph station connected to a second end of said path, means connected to said path for generating alternating currents of a first, second, third, fourth, fifth, sixth, seventh and eighth frequency of increasing numerical magnitude in numerical sequence, means at said first and said second stations, respectively for impressing on said path said currents of said first and said eighth frequencies respectively as marking signal conditions, means at said first and said second stations respectively for impressing on said path said currents of said second and said seventh frequencies respectively as spacing signal conditions, means at said third and said fourth stations respectively for impressing on said path said currents of said fourth and said fifth frequencies respectively as marking signal conditions, means at said third and said fourth stations respectively for impressing on said path said currents of said third and said sixth frequencies respectively as spacing signal conditions, means at said first, second, third and fourth stations respectively for selectively receiving currents of said third and fourth, said fifth and sixth, said first and second and said seventh and eighth frequencies respectively and means at each of said stations for transmitting its respective marking current frequency while receiving.

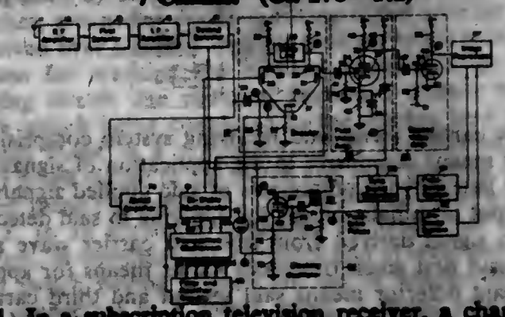
Patent No. 2,770,803

## 2,770,671
## SUBSCRIPTION TELEVISION SYSTEM

Alexander Eliot, River Forest, Ill., assignor to Zenith Radio Corporation, a corporation of Illinois

Application February 2, 1951, Serial No. 209,185
20 Claims. (Cl. 178—5.1)



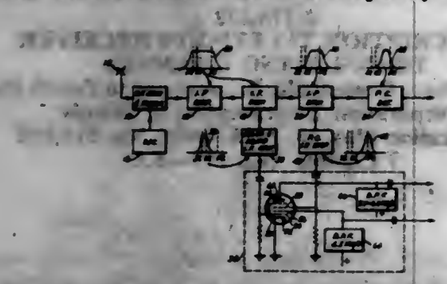
1. A subscription type of television transmitter comprising: a generator for developing a television signal representing a scanned subject and for transmitting said signal to subscriber receivers; [illegible] connected to said generator for selectively [illegible] of said signal between a plurality of [illegible] modes during spaced operating intervals; a control circuit for controlling said coding apparatus to determine a first group of spaced operating intervals in each of which a variation is effected in the mode of transmission; a selector device controlling said coding apparatus to determine a second group of spaced operating intervals in certain of which a mode variation is likewise effected and also to determine the particular one of said plurality of modes selected by said coding apparatus during said spaced operating intervals of both said groups; and means coupled to said selector device for actuating said device in accordance with a coding schedule.

## 2,770,672
## SUBSCRIPTION TELEVISION RECEIVER TRANSLATING CHANNEL

Walter S. Druz, Bensenville, Ill., assignor to Zenith Radio Corporation, a corporation of Illinois

Application May 25, 1955, Serial No. 510,898
7 Claims. (Cl. 178—5.1)

1. In a subscription television receiver, a channel for translating a composite television signal which, in addition to the usual video and synchronizing components, includes code signal components which occur during retrace intervals and within an amplitude range otherwise assigned to the video components and therefore subject to impairing retrace blanking in the receiver, said channel comprising: first, second and third video signal translating stages coupled in cascade; means for applying said composite television signal, with the synchronizing components negative with respect to the video components, to said first stage; a source for developing a potential during at least that portion of said retrace intervals in which said code signal components occur; means for impressing a potential from said source on said first stage with a polarity tending to render said first stage non-conductive and of such magnitude that any of said code signal components remaining in said television signal as applied to said second stage are predominately positive with respect to said video components; means for impressing a potential from said source on said second stage with a polarity tending to increase the gain of said second stage and of such magnitude that the residuum of said code signal components in said television signal as applied to said third stage are negative with respect to the peak amplitude level of the synchronizing components in the output signal of said second stage prior to the application of the potential thereto; and biasing means for said third stage for establishing a cut off condition in response to signal levels negative with respect to approximately said peak synchronizing level, thereby to remove said code signal components from said composite television signal and establish in place thereof retrace blanking pulses.

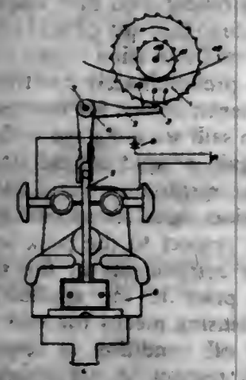


## 2,770,673
## SOUND AND COLOR SIGNAL DETECTION SYSTEM

Edgar M. Cruemer, Jr., Philadelphia, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania

Continuation of application Serial No. 316,511, October 23, 1952. This application March 8, 1955, Serial No. 492,900
19 Claims. (Cl. 178—5.4)

1. A receiving system for a composite signal comprising a first intelligence component in the form of a first



modulated carrier wave having a first given frequency value and having a frequency spectrum extending to a given maximum frequency value, a second intelligence component in the form of a second modulated carrier wave having a second given frequency value and having a frequency spectrum arranged at one end of the frequency spectrum of said first intelligence component, and a third intelligence component in the form of a third modulated carrier wave having a third given frequency value and having a frequency spectrum arranged adjacent to the frequency spectrum of said second carrier wave at the end thereof remote from the frequency spectrum of

said first carrier wave, said receiving system comprising: detector means responsive to the application of signals to produce heterodyne components of said applied signals at said output terminals; means for applying to said detector means a signal derived from said first carrier wave and having said first given frequency value; means for applying to said detector means said second and third carrier waves; and means for selectively deriving from said detector means heterodyne components of said signal having said first frequency value and said second carrier wave and heterodyne components of said signal having said first frequency value and said third carrier wave.

**TAPE RECORDING APPARATUS**
**Arthur Edward Brewster, London, England, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware**
**Application October 7, 1953, Serial No. 384,579**
**Claims priority, application Great Britain October 9, 1952**
**4 Claims. (Cl. 178—17)**

1. A device for selectively altering the time interval between telegraph characters in a telegraph repeater, each character represented by a signal combination consisting of a start element, a plurality of intelligence elements and a stop element comprising means for receiving incoming telegraph signals, means for applying said incoming signals to a record medium, means for advancing said record medium past said signal applying means, said advancing means comprising a wheel having a plurality of stop members equally disposed about the periphery thereof, arresting means coupled to and under control of said receiving means for selectivity co-operating with said stop members, the arc between adjacent stop members being of such a length that said wheel is rotated an angular distance equal to said arc length during the receipt of a start element, intelligence elements and a portion of a stop element, said arresting means adapted to co-operate with a stop member upon the receipt of a portion of a stop element at the conclusion of a received signal combination, said arresting means adapted to release said stop member upon the receipt of the start element of the next succeeding telegraph character, whereby the advance of said recording medium is halted independently of the time interval between such stop and start elements.

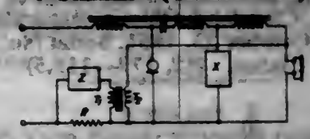
**AUTOMATIC TELEPHONE EXCHANGE SYSTEMS**
**Thomas Harold Flowers, London, England**
**Application August 3, 1950, Serial No. 177,411**
**Claims priority, application Great Britain August 12, 1949**
**37 Claims. (Cl. 179—18)**



1. An automatic telephone exchange line selecting system comprising a marker and at least one switch having at least one set of selector terminals for connection to a speech trunk, a signal trunk and a forward marking trunk and at least one set of bank terminals for connection to a speech trunk and a signal trunk, a marker lead associated with each set of bank terminals, means for signalling the condition free or engaged of the speech trunk connected to each set of bank terminals, means responsive to a mark on a marker lead for backwardly marking the associated speech trunk if it is signalled to be free and in which each switch is provided with a common backward marker lead and means for marking the same when at least one speech trunk on the bank side of the switch is marked, said system further comprising link circuits connecting successive ranks of switches, each link circuit comprising leads connecting the speech and signal trunk terminals of a set of bank terminals of a switch in one rank to the corresponding speech and signal trunk terminals of a set of selector terminals of a switch in the next higher rank; said system further comprising means for marking the marker leads of a group of bank terminals designated by called number signals communicated to the marker, means for communicating called number signals received over a calling incoming circuit to the marker and means for marking the forward marking trunk of the calling circuit, the common backward marker lead for each switch being coanected to the marker lead of each speech trunk in a previous rank of switches connected over a link circuit to the switch and each forward marking trunk being connected to a corresponding signal trunk.

18. In an automatic telephone exchange line selecting system, in combination; a marker and at least one switch, said switch having at least one set of selector terminals for connection to a speech trunk, a signal trunk and a forward marking trunk and at least one set of bank terminals for connection to a speech trunk and a signal trunk, a marker lead associated with each set of bank terminals, means for signalling the condition free or engaged of the speech trunk connected to each set of bank terminals, means responsive to a mark on a marker lead and to said free or engaged signal for backwardly marking the associated speech trunk when it is signalled to be free and in which each switch is provided with a common backward marker lead and with means for marking the same when at least one speech trunk on the bank side of the switch is marked, said system further including means for marking the marker leads of a group of bank terminals designated by called number signals communicated to the marker.

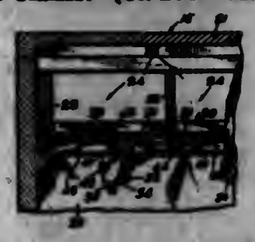
2,770,689
AUTOMATIC INTERRUPTER DEVICE FOR THE ELECTRICAL CIRCUIT IN AUTOMOBILE VEHICLES IN CASE OF COLLISION OR OVERTURNING OF SAME
Luis Gonzalez, Lomas de Zamora, Argentina
Application July 1, 1953, Serial No. 365,468
6 Claims. (Cl. 200—61.52)



1. An automatic interrupter device for the electrical circuit in automobile vehicles in case of collision or overturning of same, characterized by the fact that it comprises a relatively heavy disk, horizontally displaceable and freely disposed in the interior of a casing rigidly fixed to the structure or body of the vehicle; said disk carries centrally mounted on its upper face, a pin disposed resting and axially lined up, against a piece of insulating material, opposed by a spring and capable of sliding vertically with regards to the above mentioned disk; said sliding piece being provided with means capable of alternatively establishing a bridging connection between two pairs of contacts, disposed in the interior of the said casing, the first

one of them being adapted to be directly inserted in the circuit "generator-ignition key" of the automobile; the second pair of said contacts being adapted to be electrically coupled, through a relay, to the circuit battery-ground of the said automobile; the above mentioned disk resting on a vertically sliding plate, opposed by a spring capable of maintaining the pin of said disk pressed against the piece of insulating material and establishing the bridge on the first pair of contacts; means to correctly guide the vertical sliding of the said disk, and means for manually operating the above mentioned resting plate of the disk.

2,770,691
STARTER SWITCH
Albert H. Winkler, Elmira, N. Y., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application November 27, 1953, Serial No. 394,774
6 Claims. (Cl. 200—61.9)

1. An electrical starting switch for an internal combustion engine having a throttle, comprising a stationary

contact, a movable contact, a piston connected to said movable contact, a stem, a slot in said stem of greater length than the piston adapted to surround said piston and provide a lost motion connection therewith, a spring urging said stem in a switch closing direction, a throttle actuated lever for moving said stem in a switch opening

direction, a second slot in said stem, a vacuum actuated piston in said second slot, a first annular groove in said vacuum piston adapted to receive said stem when the switch is in a closed position, and a second annular groove in said vacuum piston adapted to receive said stem to hold said switch in an open position.

---

2,770,692
SNAP SWITCH
John F. Dalton, Springfield, Clayton A. Fischer, Chatham, and William G. Turnbull, Jr., New Providence, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 12, 1952, Serial No. 325,638
7 Claims. (Cl. 200—67)

1. A snap switch comprising a housing, a flat, elongated spring means having its ends seated on spaced portions of the housing, stop means at each of said spaced portions to restrain the ends of said spring means, said spring means including two cantilever elements inwardly directed from said ends and extending along its longitudinal axis, the adjacent ends of said elements being spaced to accommodate a U-shaped spring clip having re-entrant tips for receiving the ends of said elements, the spacing between said ends of the elements being less than that between the tips, whereby said elements are urged out of the plane of the spring means, an axially movable switch operating plunger within and secured to said clip with its axis perpendicular to the plane of the spring means, normally open, spring mounted switch contacts adjacent one end and in the path of said plunger, and an operating button on the other end thereof; a bowed return spring secured to the plunger and bearing on the stop means for biasing said plunger away from the switch contacts, and an expanding coil spring housed in the plunger between the tips of said clip to aid in biasing said tips toward the cantilever elements of the flat spring means.

---

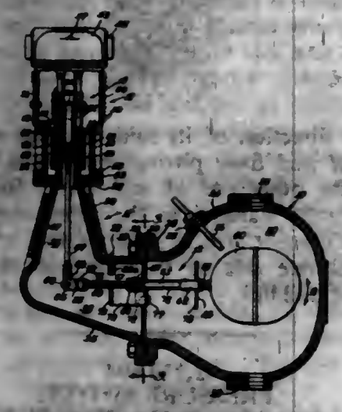
2,770,693
SNAP SWITCH MECHANISM
Lester E. Fichel, Columbus, Ohio, assignor to Ranco Incorporated, Columbus, Ohio, a corporation of Ohio
Application June 21, 1954, Serial No. 438,014
3 Claims. (Cl. 200—67)

1. In a snap switch mechanism, a contact arm having one end free to move in opposite directions between limits, spaced stops forming limits of movement of said end of said contact arm, a relatively rigid toggle link having one end pivoted to said arm adjacent to said one end, a pair of fixed spaced pivots for said link, one on opposite sides thereof and intermediate the ends thereof, said stops forming alternate pivots for said link when said link is shifted in the directions of said movements of said contact arm, a spring having one end pivotally connected to the other end of said link and urging said

link in the direction of its said one end and to one or the other of said fixed pivots, and means pivotally connected to the other end of said spring for moving said spring generally parallel to the movement of said one end of said contact arm to shift the line of force of said spring from one side to the other of the longitudinal centerline of said link.

---

2,770,694
PRESSURE SWITCH
Jean Mercier, New York, N. Y.
Application July 12, 1952, Serial No. 298,583
12 Claims. (Cl. 200—83)



1. A pressure switch for operating the resiliently urged control member of a microswitch, comprising a slidably mounted member, means to connect a source of pressure to said member to effect movement thereof, resilient means operatively connected to said member to restrain movement thereof until the pressure has risen to a predetermined amount, means to restrain movement of said member after it has moved a predetermined distance in response to the rise in pressure to such predetermined amount, said means including a second resilient means reacting against said member after it has moved such first determined distance, and restraining movement of said member until the pressure rises above a second predetermined amount greater than the first amount, a second member slidably mounted on said first member and movable longitudinally thereof, means to limit the movement of said second member in two directions, and resilient means normally urging said second member to its outermost position.

---

2,770,695
BOILER CONTROL MECHANISM
Leopold J. Kulecki, Chicago, Ill., assignor to McDonnell & Miller, Inc., Chicago, Ill., a corporation of Delaware
Application January 21, 1954, Serial No. 405,286
7 Claims. (Cl. 200—84)

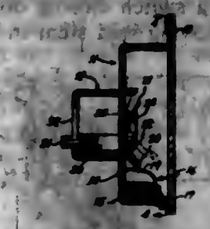
1. In a liquid level responsive boiler control device of the class described, a float chamber housing having liquid

inlet and outlet means, a substantially elbow shaped linkage housing connected to one side of said float housing and enclosing a substantially horizontal chamber communicating at one end with the interior of said float chamber housing and at the other end with a substantially vertical chamber, skirt wall means depending partially into said horizontal chamber and serving to trap air in said vertical chamber when liquid is introduced to said device, switch means mounted exteriorly of the upper end of said vertical chamber, float means in said float chamber, linkage means

connecting said switch means to said float means, leaf spring means supporting said linkage means in a manner permitting arcuate movement of said float to operate said switch means, and air cooling fin means formed about the wall portions of said linkage housing which enclose and define said vertical chamber, whereby said switch means is effectively insulated from the operating temperatures existing within said float chamber by the air entrapped in said vertical chamber and said wall portions of such linkage housing are effectively cooled by said fin means.

---

2,770,696
TAPE SWITCH
Robert H. Koenig, Forest Hills, N. Y.
Application January 6, 1954, Serial No. 402,460
3 Claims. (Cl. 200—86)



1. An electrical tape switch adapted to be coiled like a cable comprising a pair of spaced continuous uniform conducting stripe having a slight transverse curvature, and a pair of insulating strips placed between said conducting stripe adjacent the outer edges thereof, a continuous flat insulating strip placed under said conducting stripe, and continuous weatherproof jacket enclosing said strip, wherein at least one of said conductor stripe comprises segmented overlapping leaves adapted to move axially with respect to each other, thereby permitting coiling and bending without buckling, the outer of said strips being axially stretched and the inner of said strips being axially compressed.

---

2,770,697
MAGNETIC ELECTRICAL SWITCH
Alfred L. Kalbat, New Hyde Park, N. Y.
Application April 1, 1954, Serial No. 420,400
5 Claims. (Cl. 200—87)

1. A switch comprising a sealed container, switch elements in said container, each of said switch elements having an inclined section, a member formed of magnetic material and bent along the length thereof, means adjacent a wall of said container pivotally mounting said member for rocking movement within said container, means including a conductive bar insulatedly carried by one end of said member adapted to move into and out of wiping engagement with said switch elements upon rocking of said member, a magnet adjacent the exterior

of the aforementioned container wall, and means for slidably mounting said magnet for lengthwise movement with respect to said member to alternately attract the respective ends of said member and effect rocking movement thereof.

---

2,770,698
THERMOSTATIC SWITCH
Herman Ulanet, Maplewood, N. J.
Application November 2, 1953, Serial No. 389,523
11 Claims. (Cl. 200—138)

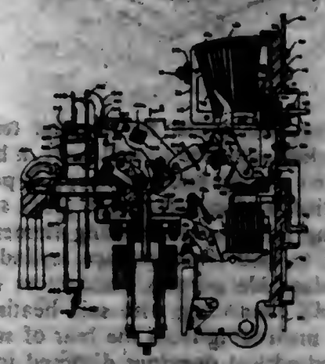
5. A thermostatic switch comprising, in combination, a sealed enclosure; switching mechanism therein comprising a plurality of contact arms and a thermo-sensitive element controlling the movement of one of said arms; a plug or head sealing one end of the said enclosure; an adjusting screw threaded through said head; an adjusting member threaded into the inner end of said adjusting screw with a shorter pitch than the pitch of the threads on the adjusting screw exterior, the inner end of said adjusting member contacting one of said switch arms to adjust the setting of the same; and a bellows surrounding the stems of the adjusting screw and adjusting member, one end of said bellows being sealed to the inner face of the said enclosure head, the other being sealed to the adjusting member, whereby the latter will be held against rotation but given micrometer longitudinal movement upon rotation of the adjusting screw.

---

2,770,699
THERMOSTATIC CONTROL DEVICE
Paul F. Shivers, Minneapolis, Minn., assignor to Robertshaw-Fulton Controls Company, Greensburg, Pa., a corporation of Delaware
Application June 23, 1955, Serial No. 517,511
11 Claims. (Cl. 200—138)

2. In a thermostatic control device, the combination comprising a pivotally mounted mercury switch movable from one angular position to another for controlling the flow of electric energy, a bimetallic element operatively

connected to said mercury switch for varying the angular position of said mercury switch in response to variations in temperature of said bimetallic element, and manually operable means for varying the angular position of said mercury switch, said bimetallic element being bent to substantially enclose said mercury switch whereby substantially the entire surface of one side of said bimetallic element will be directly exposed to the surrounding air.



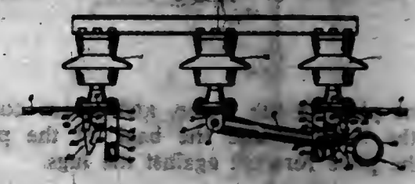
---

2,770,700
DIRECT CURRENT ELECTRIC SWITCHING CONTACTS
Ragnar Holm and Else M. K. Holm, St. Marys, Pa., assignors to Stackpole Carbon Company, St. Marys, Pa., a corporation of Pennsylvania
No Drawing. Application March 12, 1953, Serial No. 342,026
5 Claims. (Cl. 200—166)

1. A cooperating pair of electric relay contacts for use with voltage regulators and the like utilizing low direct current that may form an arc when the contacts are separated, in which at least one of the contacts is formed from an electrically conducting material including up to about 5% of material selected from the group of elements consisting of cadmium, bismuth, antimony, manganese and chromium, the amount of said last-mentioned material being great enough to produce an anode voltage drop in said arc when the intensity of said current reaches a predetermined value, and the balance noble metal.

---

2,770,701
ESCUTCHEON DESIGN FOR CIRCUIT BREAKERS
Charles J. Yarrick, West Collingswood, N. J., assignor to I-T-E Circuit Breaker Company, Philadelphia, Pa., a corporation of Pennsylvania
Application October 29, 1951, Serial No. 253,717
7 Claims. (Cl. 200—167)



1. An escutcheon unit for circuit breakers comprising a movable gas-excluding rigid escutcheon plate, a stationary escutcheon plate, a visual indicator, a handle and a driving mechanism; said visual indicator being moved by said driving mechanism when said circuit breaker is opened or closed; said stationary escutcheon plate being fixed with respect to said circuit breaker and having movably mounted thereon said handle which manually operates said circuit breaker; resilient means pressing said movable escutcheon plate into sealing relationship with said stationary escutcheon plate.

---

2,770,702
LATCH FOR SINGLE AND DOUBLE THROW HOOK OPERATED DISCONNECT SWITCH
Theodore A. Fjallstedt, Ingleside, Ill., assignor to McGraw Electric Company, Milwaukee, Wis., a corporation of Delaware
Application April 7, 1954, Serial No. 421,531
5 Claims. (Cl. 200—169)

1. In an electric switch, the combination of a hinge member, a contact member and a switch blade mounted on said hinge member for swinging movement relative to said contact member, a latch juxtaposed to said contact member, said latch having a cutaway portion defining intersecting catch and cam surfaces, said cam surface being intermediate said catch and the pivot axis of said latch, a spring interposed between said contact member and said latch biasing said latch toward said contact member, a fixed latch pin transversely through said blade engageable with the catch in substantially the same plane as the latch pivot, a bifurcated member straddling said blade

at its free end and pivotally mounted on said latch pin, prying arms disposed on opposite sides of said latch pin on each furcation and extending adjacent said cam surfaces on said latch when said switch is in latched position, a stop pin transversely through said switch blade intermediate said arms, and a hook stick ring integral with said bifurcated member, whereby rocking of said bifurcated member by means of said hook ring will urge said latch clear of said latch pin and pry against said cam surfaces to urge said blade toward open circuit position.

---

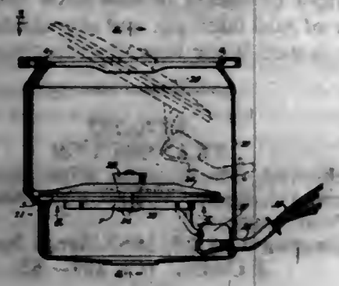
2,770,703
TRANSDUCER
John S. Schoenrich, Minneapolis, Minn., assignor to Northern Pump Company, Minneapolis, Minn., a corporation of Minnesota
Application May 28, 1953, Serial No. 358,063
1 Claim. (Cl. 201—63)

A device for measuring pressures having in combination, a casing having a chamber therein, a ring disposed in said chamber and having one side engaging a rigid surface at one end of said chamber, a diaphragm having one side in a plane tangentially engaging said ring at the opposite side thereof, means for holding said diaphragm in position, a member secured in said casing having a passage therethrough for fluid, said passage being disposed to transmit pressure of fluid therein to said diaphragm, a pair of strain gages secured respectively on the outer and inner side of said ring between said engaged sides thereof, electrical conductors extending from said gages, a bar extending through said ring at said first mentioned side, means extending through the ends of said bar and threaded into said casing for holding said ring rigidly in said casing, and said means being movable to release said ring so that it can be rotated about its central axis.

---

2,770,704
RADIANT HEATERS
Emil W. Ruthe, New York, N. Y., assignor to Continental Radiant Glass Heating Corporation, New York, N. Y., a corporation of Michigan
Application January 31, 1951, Serial No. 208,738
4 Claims. (Cl. 219—34)

3. In an electric heater, a panel-like glass heater plate having a rear face provided with an electric resistance heating element, a frame for the plate, a bracket behind each end of the plate, means connecting the bracket to



the frame, a lug detachably connected to each bracket and overlying a small area of the outer face of the plate

to hold the plate in the frame, and means compressed between the brackets and the back of the plate and pressing the plate forward against the lugs.

---

2,770,705
LIFTING DEVICE FOR THRIFT COOKER UNIT
Ernst P. Lang, Chicago, Ill., assignor to General Electric Company, a corporation of New York
Application February 1, 1954, Serial No. 407,517
6 Claims. (Cl. 219—37)

1. In combination, an electric range having a cooking top provided with a well, a substantially circular heating unit disposed in said well and movable between operative positions at the bottom and at the top of said well, said heating unit including spaced supporting elements, a cooking vessel for use with said heating unit in either of its operative positions, a cover for said vessel, said cover being smaller in diameter than said well, and a plurality of hook members fixed to the underside of said cover and extending downwardly therefrom to below the rim thereof for engagement with the underside of said supporting elements centrally of said heating unit to provide for manually moving said heating unit from one to the other of its said operative positions.

---

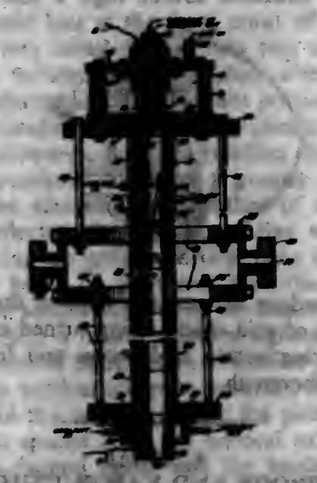
2,770,706
METHOD AND DEVICE OF HEATING SPRAYING AGENTS
Friedrich Vögtle, Ehingen (Danube), and Johann Vögtle, Neuselwangen Kreis Überlingen (Bodan See), Germany
Application February 17, 1953, Serial No. 337,294
Claims priority, application Germany February 28, 1952
14 Claims. (Cl. 219—39)

14. A spraying device, comprising, in combination, spraying means for spraying fluid material under pressure; vessel means having an inlet and an outlet and being connected at its outlet to said sprayig means, said vessel means being adapted to contain fluid material flowing therethrough to said spraying means for spraying thereby, and having spaced surface portions defining a laminar passage through which the fluid material is forced to flow in a thin film in its flow toward said spraying means; electrical heating means associated with said vessel means outside thereof for heating said laminar passage so as to heat the film of fluid material flowing therethrough; and operating means for starting and stopping the operation of said spraying means and said heating means simultaneously, said operating means including an electrical circuit having thermo-regulator means and switch means operable thereby for operating said heating means, said

operating means further including compressed fluid supply means operatively connected to said spraying means, and regulating means for controlling the flow of compressed fluid in said supply means; said switch means being operable by said regulating means for stopping and starting the operation of said heating means.

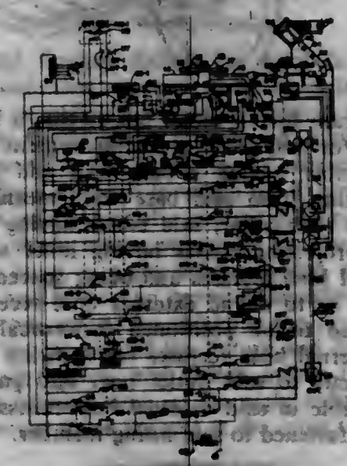
---

2,770,707
TEST TUBE HEATER
Anthony G. Jordan, Battle Creek, Mich.
Application February 18, 1954, Serial No. 411,073
5 Claims. (Cl. 219—43)



4. In laboratory apparatus for heating test tubes, a ceramic body, a lead attached to said body, a heating unit comprising a fixed portion and a replaceable portion, said replaceable portion having a C-shaped front surface portion for receiving tubes, and a heating element disposed upon the glued to said front surface, cylindrical openings in said replaceable portion, conductors disposed in said openings and connecting with said heating element, said conductors protruding from the rear of said replaceable element, cylindrical openings disposed in said fixed portion aligned with the first mentioned cylindrical openings, arcuate contact surfaces in said last mentioned cylindrical openings adapted to receive and continue contact with said protruding conductors, a pair of additional cylindrical openings disposed at right angles to the before mentioned cylindrical openings, conductors received in said openings and contacting said arcuate contact surfaces, said conductors continuing contact from said arcuate contact surfaces to said lead.

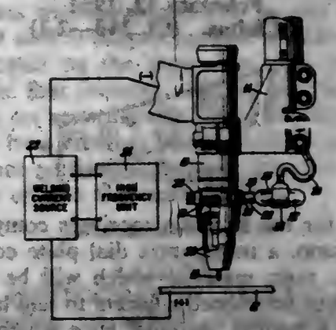
---



2,770,708
ELECTRIC ARC TORCH
Rufus L. Briggs, Melrose, Mass., assignor to Amalgamated Growth Industries, Inc., New York, N. Y., a corporation of Delaware
Application September 21, 1954, Serial No. 457,343
12 Claims. (Cl. 219—75)

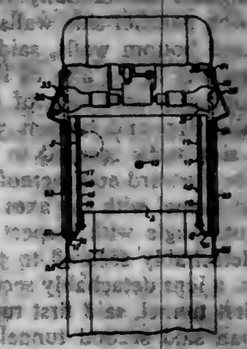
1. In an electric-arc torch, an upstream electrode, a hollow downstream electrode, an elongated arc chamber extending between said electrodes and axially spacing all parts of said upstream electrode from all parts of said downstream electrode, and inlet-gas-supply means at the upstream end of said chamber for inducing a flow of gas along said chamber and through said downstream electrode, said chamber comprising a plurality of like interfitting sectional elements of insulating material.

---



2,770,709
ELECTRIC FLASH-BUTT-WELDING MACHINES
Charles D. Moore, Byfield, and Hermann W. Stieglitz, Marblehead, Mass., assignors to Thomson Electric Welder Company, Lynn, Mass., a corporation of Massachusetts
Application May 25, 1954, Serial No. 432,124
33 Claims. (Cl. 219—97)

1. A flash-butt-welding machine including relatively movable platen means for supporting workpieces to be welded, reversible fluid motor means for moving said platen means toward and away from one another at a substantially constant pressure in accordance with the fluid pressure supplied thereto, a snubbing device, a toggle mechanism connected between said snubbing device and said platen means for cooperating with said snubbing device to resist the relative motion of said platen means induced by said motor means during the first portion of the movement of said platen means toward one another and thereafter to permit said motor to complete said movement of said platen means toward one another substantially unresisted by said snubbing device, valve means effective to vary the direction of travel of said motor means, and control means responsive to voltage across said workpieces, said control means being connected and arranged to operate said valve means to preheat said workpieces by butting said workpieces and then moving said platen means away from one another to gap said workpieces, and finally to weld said workpieces by moving said platen means toward one another.

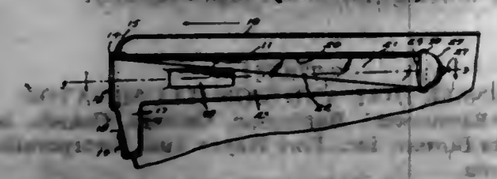


2,770,710
ARC WORKING APPARATUS
Walter E. Burkart, St. Louis, Mo., assignor to Union Carbide and Carbon Corporation, a corporation of New York
Application May 26, 1954, Serial No. 432,536
4 Claims. (Cl. 219—130)

1. Arc working apparatus comprising the combination with a metal bracket, an electric arc working torch having a body mounted on said bracket, said torch comprising an electrode and a gas cup of metal surrounding and spaced from such electrode and insulated from said body of the torch, and sources of working current and high-frequency connected to said electrode, of a neon tube comprising a metal base provided with at least one terminal and a glass envelope, means electrically connecting said terminal to said gas cup, and means including a metal clip electrically connecting said glass envelope to said bracket, said neon tube and clip being effective as a potential discharge condenser to assure the starting of a working arc between such electrode and another electrode in circuit with said sources of working current and high-frequency.

---

2,770,711
DISPENSER DIAL AND SIGN ILLUMINATOR
Leslie B. Baranowski, Burlington, Ontario, Canada, assignor to Bowser, Inc., Fort Wayne, Ind., a corporation of Indiana
Application March 16, 1953, Serial No. 342,642
2 Claims. (Cl. 240—2.1)



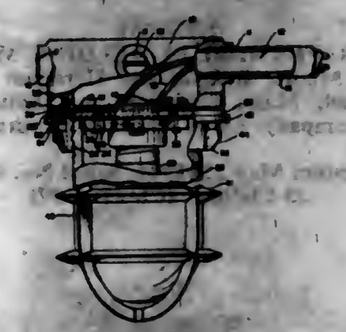
1. In a liquid dispenser, a planar dial, a door, a door glass therein disposed in parallel, closely spaced relation to the dial, means for supporting a lamp above the dial and glass with its longitudinal axis substantially normal to the plane of the dial, a translucent sign panel mounted in the door above said glass, said panel having upper and lower planar walls disposed substantially at right angles to each other, said upper wall being longer than said lower wall, said walls intersecting to form a concave-convex wall disposed at the level of the lamp and with its convexity extending away from the lamp, said lamp being disposed to extend into the concavity of the panel to position the filament of the lamp directly above the space between the dial and door glass, said panel convexity projecting from said dispenser whereby the outside surfaces of the dispenser and the ground around the dispenser will be illuminated when said lamp is energized.

2,770,712
**ILLUMINATED DIAL PLATE**
Arie Dros, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application January 9, 1952, Serial No. 265,683
Claims priority, application Netherlands February 12, 1951
2 Claims. (Cl. 240—2.1)

1. A dial for use in radio receivers comprising an incandescent lamp, a transparent dial plate composed of a thermoplastic resin material which will be deformed or discolored when positioned adjacent to said lamp, said dial plate having a bottom marginal edge which slants angularly upwards, and a transparent connecting piece arranged between said lamp and said dial plate and angularly thereto, said piece being adapted to transmit light from said lamp to said dial plate through said bottom marginal edge and said piece being composed of a thermoplastic resin material exhibiting a value of resistance to heat at which said piece is not substantially deformed or discolored when adjacent said lamp.

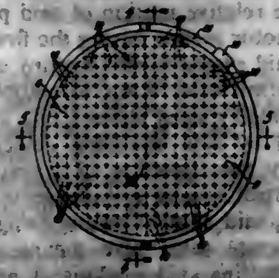
2,770,713
**VEHICLE HEADLIGHT**
Wesley Earl Sears, McKee, Ky.
Application March 5, 1954, Serial No. 414,441
1 Claim. (Cl. 240—7.1)

In a vehicle headlight system of the type having dual head lamps, a construction for each of said head lamps comprising, an elongated substantially rectangular hollow first tunnel having parallel side walls and rearwardly converging top and bottom walls, said tunnel having its axis extending parallel to the axis of the vehicle, said tunnel having the opposite ends thereof open, a second tunnel having parallel top and bottom walls and rearwardly converging side walls secured to a side wall of said first tunnel at the forward end thereof and communicating with said first tunnel with the axes of said tunnels extending at an acute angle with respect to each other, a source of light detachably secured to the rear end of each of said tunnels, a lens detachably secured to the forward end of said first tunnel, said first tunnel being substantially longer than said second tunnel with the light rays from each of said tunnels passing through said lens, a second lens positioned below said first lens, and reflector means depending from the bottom wall of said first tunnel rearwardly of said second lens for reflecting a portion of the light from each of said light sources through said second lens.



2,770,714
**PLASTIC SHIELD FOR FLUSH-MOUNTED HEADLAMP**
Howard C. Mead, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application May 27, 1953, Serial No. 357,751
6 Claims. (Cl. 240—8.1)

1. A light passing device adapted for attachment in front of a headlamp lens comprising a light passing shield, a circumferential recess in the base of said shield, a continuous metallic ring positioned in said recess, a plurality of fastening bolts attached to said ring, and a



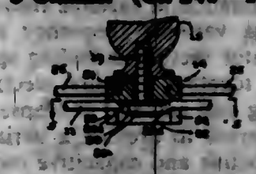
chamfer formed on at least one edge of the base of said ring, the base of said shield being turned over said edge to lock said ring within said recess and form a unitary combination therewith.

2,770,715
**WEATHERPROOF AND VAPOR-TIGHT FIXTURE**
Henry D. Stecher, Lakewood, Ohio
Application September 3, 1953, Serial No. 378,350
6 Claims. (Cl. 240—11.2)

6. In a fixture for an outlet box having a lamp globe and a guard for said globe, the improvement comprising a fitting member having a base wall and an annular collar projecting from said base wall, means to secure said globe to said collar, said collar having a plurality of radially projecting bosses having inner surfaces defining internal boss recesses and being spaced from said base wall so as to define external boss recesses, screw means adapted to be positioned in vertical alignment with said internal boss recesses for securing said fitting member directly to said outlet box, said guard having parts engageable in said external boss recesses whereby said guard is fastened to said fitting member.

2,770,716
**T-SHAPED SPLIT BEAM TRACTOR LAMP**
James E. Kingery, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application August 22, 1952, Serial No. 305,793
6 Claims. (Cl. 240—41.3)

2. A vehicle lamp comprising a generally cup-shaped reflector vertically divided into two parabolic sections of substantially equal size and shape, said sections being

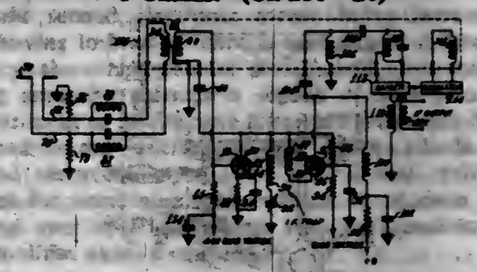


tilted inwardly toward each other so that their optical axes are at an angle with respect to each other in a substantially horizontal plane, a lens positioned in front of said reflector and a light source mounted between said reflector and said lens at the focal point of said reflector sections, said lens being divided into two portions along a vertical line substantially coinciding with the dividing line of said reflector, each of said lens portions being provided with a plurality of substantially identical contiguous light bending elements, the light bending elements in one of said lens portions providing a greater vertical light spread than the elements in the other of said portions, one of said reflector sections cooperating with said lens portion providing the greater vertical light spread to project a frontal beam of light and the other of said reflector sections cooperating with the other of said lens portions to project a lateral beam of light at an angle to said frontal beam of light, the combination of said beams producing on a vertical screen, a generally T-shaped light pattern wherein the vertical axis of the pattern from the lateral beam is spaced from the vertical axis of the pattern from the frontal beam and the horizontal axis of the pattern from the lateral beam substantially dissects the vertical axis of the pattern from the frontal beam.

2,770,717
**ELECTRIC LIGHTING FIXTURE**
Martin W. Schwartz and Max J. Marks, Chicago, Ill.
Application February 6, 1953, Serial No. 336,534
7 Claims. (Cl. 240—73)

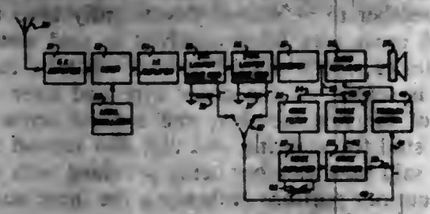
1. A night lighting fixture for cabinets, mirrors and the like, comprising supporting means including a translucent base extending horizontally from a wall and over a cabinet or mirror to be illuminated, a straight tubular lamp supported in the fixture in a horizontal position at a distance from the wall to which the fixture is connected so that it is in advance of a cabinet opening or a mirror, transparent shade means supported by the base and enclosing the lamp, a night light mounted in the base of the fixture and having an opening therethrough for light rays therefrom, means for shielding the rays of the night light from the interior of the fixture and from illuminating the shade means, and switch means for connecting the straight tubular lamp or the night light for illumination at different times but not at the same time.

2,770,718
**LAMP SHADE MOUNTING MEANS**
Herbert Lapin, Great Neck, N. Y.
Application November 9, 1953, Serial No. 390,840
3 Claims. (Cl. 240—148)



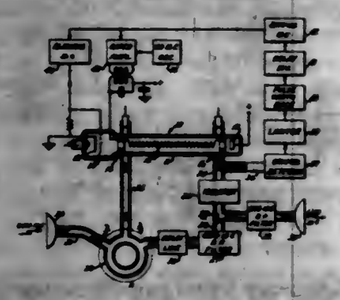
1. In combination, a lamp harp frame having a cross wire, a downwardly extending U-shaped intermediate portion in said cross wire having side arms connected by a web, and a connection for mounting a lamp shade on the cross wire, said connection comprising a first member and a second member, said first member having a base element, a threaded stud extending up from said base element, said base element resting on and being formed around the web of said U-shaped portion in said cross wire and between the side arms of said U-shaped portion, to clamp said first member on said cross wire, said second member having an opening extending through the center thereof, said threaded stud on the first member being positioned in said opening and extending out therefrom, said second member having downwardly opening slots through the sides thereof to permit said second member to be moved downwardly onto the cross wire, said cross wire being received in said slots on opposite sides of said U-shaped portion whereby the second member is seated on the cross wire and over the base element of the first member, and a finial screw on said threaded stud for securing said first and second members together, said base member being provided with a pair of opposed cut-out portions embracing the inner surfaces of the side arms of said U-shaped portion.

2,770,719
**PHOTOGRAPHIC SYSTEM**
Luther G. Simjian, Greenwich, Conn., assignor to The Reflectone Corporation, Stamford, Conn., a corporation of Connecticut
Application April 2, 1954, Serial No. 420,600
6 Claims. (Cl. 250—69)



1. A photographic system for locating objects within a body comprising; two sources of penetrating radiation positioned on opposite sides of the body; two photographic films also positioned on opposite sides of the body in close proximity thereto; and two metal shields which are opaque to said radiation, each adjacent to one of said films for shielding the film from the radiation from one of said sources, said shields containing a plurality of holes for the passage of said radiation.

2,770,720
**HIGH FREQUENCY AMPLIFIER WITH ANODE TO GRID INPUT AND ANODE TO CATHODE OUTPUT**
Tomomi Murakami and Richard W. Sonnenfeldt, Haddonfield, N. J., assignors to Radio Corporation of America, a corporation of Delaware
Application May 26, 1955, Serial No. 511,210
5 Claims. (Cl. 250—20)

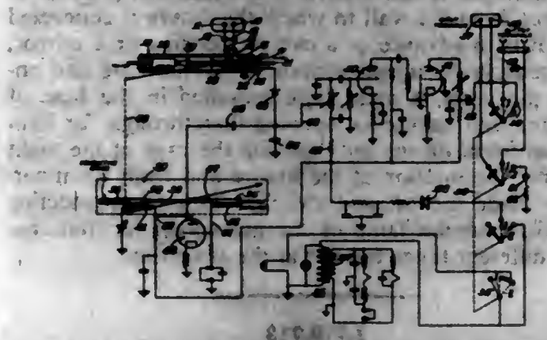


1. A high-frequency signal amplifier comprising in combination, a first and a second electron tube, each of said tubes having an anode, a cathode and a control grid; means providing a direct current connection between the anode of said first tube to the cathode of said second tube; means for applying a signal voltage between the anode and the control grid of said first tube; means effectively connecting the cathode of said first tube to ground for said amplifier at signal frequencies; means effectively connecting the control grid of said second tube to said ground at signal frequencies; and means for deriving an output signal from said amplifier between the anode of said second tube and said ground.

2,770,721
**SQUELCH CIRCUIT**
James M. Clark, Brookfield, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Application May 3, 1952, Serial No. 285,973
18 Claims. (Cl. 250—20)

1. In a radio receiver for receiving an audio modulated carrier wave and for deriving the audio signal therefrom, and having an audio signal reproducer, the voltage responsive means to control the operation of said reproducer to prevent the reproduction of noise in the absence of a desired audio signal containing voice frequencies including in combination, means responsive to noise in the derived audio signal in a selected range of frequencies above voice frequencies and also including the higher voice frequencies for producing a first direct current voltage of one polarity, means responsive to reception of a carrier wave by said receiver to produce a second direct current voltage having a polarity opposite to said first voltage, means responsive in a selected range of lower voice frequencies of the derived audio signal to produce a third direct current voltage of the same polarity as said second voltage, means to differentially combine said first, second and third voltages to provide a direct current control voltage, and means for controlling said audio reproducer in accordance with said direct current control voltage so that said reproducer is blocked when said control voltage is of said one polarity and is rendered operative when said control voltage is of said opposite polarity, whereby the reproduction of noise in the absence of a desired audio signal containing voice frequencies is prevented and the reproduction of an audio signal containing the selected range of lower voice frequencies is permitted.

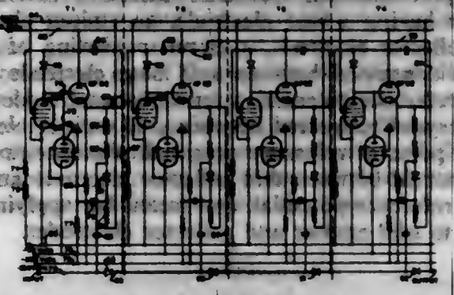
2,770,722
**TIME SHIFT RE-ENTRANT AMPLIFIER SYSTEM FOR CARRIER PULSES**
Frank R. Arams, Radnor, Pa., assignor to Radio Corporation of America, a corporation of Delaware
Application June 30, 1955, Serial No. 519,162
7 Claims. (Cl. 250—20)



1. A pulse amplifier comprising an amplifier tube having a signal input coupling and a signal output coupling, means to apply a signal to said input coupling, an input signal pulse path from said output coupling to said input coupling including a signal delay device providing a delay greater than the duration of the input signal pulse, means for causing a signal component of a predetermined frequency to appear in said output coupling only after said input signal pulse has circulated through the amplifier tube a predetermined number of times, and means including a frequency-selective device for deriving an output of said predetermined frequency from said output coupling.

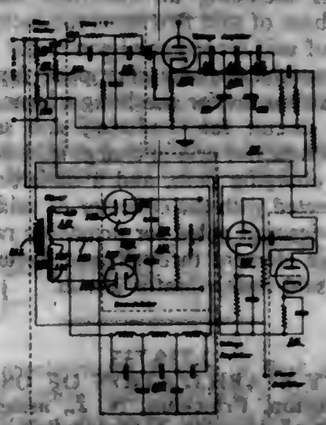
2,770,723
**ULTRAHIGH FREQUENCY TUNER**
Harry C. Rowe, Cincinnati, Ohio, assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application September 21, 1951, Serial No. 247,627
10 Claims. (Cl. 250—20)

1. In an ultra high frequency tuner, a terminal cylinder, a coaxial terminal disc, a crystal rectifier positioned in the cylinder and having its opposite terminals connected to the cylinder and the disc, a coupling plate adjacent the disc, a dielectric film positioned between the plate and the disc, inductive tuning means including the cylinder and comprising in addition a cylindrical post connected to the plate and positioned externally parallel to and eccentrically offset from the cylinder, and a tuning slider including respective sleeves slidable on the post and on the cylinder and a cross bar connected between the sleeves.

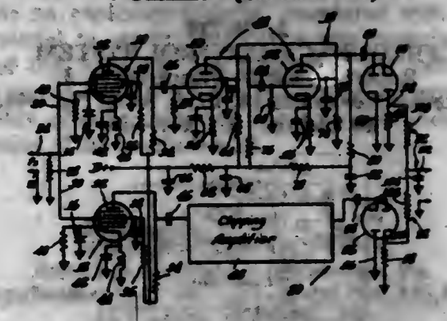


2,770,724
**CONVERTER**
Henry Nell Frihart, Brookfield, and George F. Baroch, Lombard, Ill., assignors to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Application July 26, 1952, Serial No. 301,102
9 Claims. (Cl. 250—20)

5. An ultra high frequency coaverter for tuning over a wide range of ultra high radio frequency input signals to produce a fixed frequency intermediate output signals comprising in combination, a variable frequency resonant oscillator section, a variable frequency resonant input section, said oscillator section including spaced coil and condenser portions together with first electrically conductive means spanning said coil and condenser portions and movable axially thereof to provide a variable frequency series resonant inductive and capacitive oscillator circuit, second electrically conductive means movable with said first electrically conductive means and insulatingly spaced from the end thereof associated with said coil portion and movable into said coil portion as said first conductive means is withdrawn therefrom to inductively short circuit unused turns of said coil portion, said input section including a coaxial variable capacity loaded resonant tuned unit having an axially movable coaxial element for varying the resonant frequency thereof, means for ganging said conductive means and said coaxial element for axial movement to simultaneously vary the resonant frequencies of said oscillator circuit and said input resonant unit such that the intermediate frequency output of the tuner remains substantially the same over the entire tuning range, and an axially movable conductive sleeve mounted in said coaxial variable capacity loaded tuned unit, said sleeve being electrically connected to said unit and in capacitive relation with said movable coaxial element therein to adjustably predetermine the capacity loading and the resonant frequency thereof in the middle range of travel of said coaxial element to maintain the tracking of said oscillator and input sections over their entire tuned resonant ranges.



2,770,725
**BINARY-DECADE COUNTER**
John J. Lentz, Chappaqua, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 21, 1951, Serial No. 262,802
12 Claims. (Cl. 250—27)

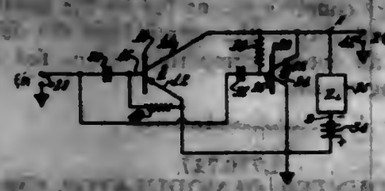


11. In an electronic circuit including a plurality of electronic switches responsive to a predetermined number of electrical changes to complete a cycle of operation, input means connected to apply said electrical changes to each of said switches, said input means including a plurality of serially connected voltage responsive devices selectively connected to said switches; and voltage transferring means connecting each of said devices to one of said switches including means coupling the voltage present at a preselected point in each switch to the device connected thereto to control the conductivity of that device.

2,770,726
**FREQUENCY ERROR SENSING AND SIGNAL SYSTEM**
Stephen H. Fairweather, South Euclid, Ohio, assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application September 28, 1953, Serial No. 382,584
4 Claims. (Cl. 250—37)

1. A frequency error sensing and signal system deriving its input from a variable frequency source, variations in the frequency of which serve as the error to be sensed, comprising a phase shifter, a twin T network fed by said phase shifter, a cathode follower fed by said twin T network, a delay line network fed by said cathode follower, energy coupling means fed by the input to the phase shifter and also by the output from the delay line network, and an energy comparing means fed by said energy coupling means.

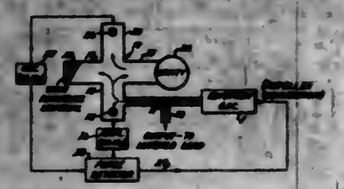
2,770,727
**DOUBLE COUNTER DEMODULATOR CIRCUIT**
Julius J. Rupert, Andrzej B. Przedpelski, and Kenneth Ringer, River Forest, Ill., assignors to A. R. F. Products, Inc., River Forest, Ill., a corporation of Illinois
Application August 21, 1952, Serial No. 305,634
4 Claims. (Cl. 250—27)



1. A frequency discriminator device for demodulating a signal frequency that is frequency modulated comprising means for generating a frequency lower than the signal frequency, means for mixing said lower frequency with the signal frequency to produce a first difference frequency, means for generating a frequency higher than the signal frequency, means for mixing said higher frequency with the signal frequency to produce a second difference frequency, a first counter discriminator for producing a voltage proportional to said first difference frequency, a second counter discriminator for producing a voltage proportional to said second difference frequency, said first counter discriminator including electronic means containing two cathodes and two plates, one of said cathodes and one of said plates being interconnected and having impressed thereon said first difference frequency, the other of said cathodes being grounded and the other of said plates being grounded through a resistance, a voltage proportional to said first difference frequency being developed at the junction between said other plate and said resistance, said second counter discriminator including a second electronic means containing a pair of plates and a pair of cathodes, one of the cathodes and plates of said second electronic means being interconnected and having impressed thereon said second difference frequency, the other plate of said second electronic means being grounded through a second resistance, a voltage proportional to said second difference frequency being developed at the junction of said other cathode of said second electronic means and said second resistor, and means for combining said voltages to produce a single voltage varying in accordance with the frequency modulation of the signal frequency.

2,770,728
**SEMI-CONDUCTOR FREQUENCY MULTIPLIER CIRCUIT**
Gerald B. Herzog, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application July 26, 1954, Serial No. 445,697
14 Claims. (Cl. 250—36)

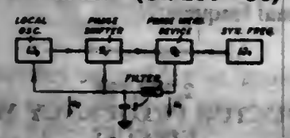
1. In a frequency multiplier circuit, the combination with a pair of semi-conductor devices of opposite conductivity types, of signal input circuit means connecting said pair of devices effectively in parallel, circuit means providing a continuous conductive path through said de-



vices serially, and means providing an output circuit connected with each of said devices, said signal input means providing a source of input signals of a predetermined

frequency for rendering said devices alternately conductive to provide a corresponding push-push output signal of a frequency equal to twice said predetermined frequency.

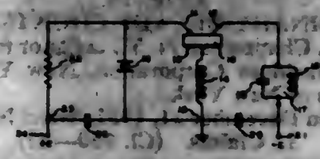
---



2,770,729
FREQUENCY CONTROL SYSTEM
Robert H. Dicke, Princeton, N. J.
Application November 14, 1955, Serial No. 546,502
20 Claims. (Cl. 250—36)

1. In an oscillator frequency control system, an oscillator the frequency of which is to be controlled, an impedance bridge type frequency discriminator comprising a magic-T assembly having two symmetrical waveguide branches and two asymmetrical waveguide branches, a passive wave impedance element terminating one of said two symmetrical branches, a cavity resonator coupled to the other of said two symmetrical branches, said resonator being matched to said assembly at the predetermined desired frequency of said oscillator, a mixer crystal coupled to one of said two asymmetrical branches, and a modulator crystal coupled to the other of said two asymmetrical branches; means for applying output energy from said oscillator to said one asymmetrical branch and to the mixer crystal coupled thereto, means coupled to said modulator crystal for modulating the energy from said oscillator appearing thereat, thereby to produce sideband energy, said mixer crystal operating to develop beat frequency energy by mixing of said sideband energy and energy from said oscillator; means for developing a frequency control voltage from said beat frequency energy, and means for applying said control voltage to said oscillator for control purposes.

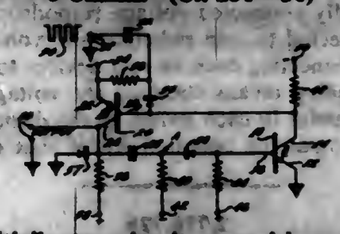
---



2,770,730
FREQUENCY CONTROL CIRCUIT
Rudolf Urtel, Pforzheim, Germany, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application July 23, 1953, Serial No. 369,791
Claims priority, application Germany July 25, 1952
3 Claims. (Cl. 250—36)

1. A frequency control circuit comprising a local oscillator, a source of synchronizing signals, a phase measuring device, means applying the local oscillations and said synchronizing signals to said phase measuring device, said phase measuring device producing a control voltage in response to a phase difference in said applied frequencies, and means applying said control voltage to said local oscillator to correct said deviations, and characterized by means for more rapidly and directly correcting said deviations comprising a phase shifting device coupled between the output of said local oscillator and the input of said phase measuring device, and means applying said control voltage to said phase shifting device, whereby said control voltage is applied simultaneously to said local oscillator and said phase shifting device.

---



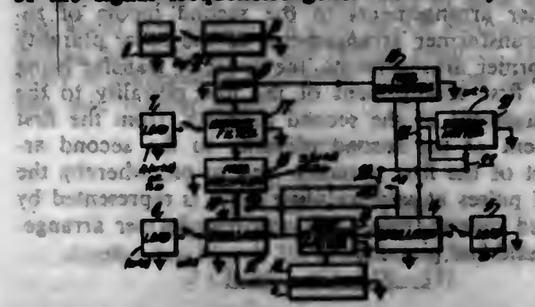
2,770,731
TRANSISTOR OSCILLATOR
Calvin C. Bopp and Richard W. Bundschuh, Cincinnati, Ohio, assignors to Avco Manufacturing Corporation, Cincinnati, Ohio, a corporation of Delaware
Application August 17, 1954, Serial No. 450,384
7 Claims. (Cl. 250—36)

1. A point contact transistor oscillator including a transistor having a base electrode, an emitter electrode, and a collector electrode, a circuit consisting of an inductance connected between said base electrode and a point of reference potential, a series-resonant mode piezoelectric crystal connected between said emitter electrode and said point of reference potential, a tank output circuit connected between said collector electrode and said point of reference potential, and means for applying bias voltages to said emitter and collector electrodes.

---

2,770,732
TRANSISTOR MULTIVIBRATOR CIRCUIT
Carlos F. Cheng, Philadelphia, Pa., assignor to Radio Corporation of America, a corporation of Delaware
Application July 8, 1955, Serial No. 520,706
6 Claims. (Cl. 250—36)

1. A multivibrator circuit comprising, a first and a second semi-conductor device of opposite conductivity types each including a base, an emitter and a collector electrode, means providing a direct current conductive connection between the collector of said first semi-conductor device and the base of said second semi-conductor device, means including an electrical storage element coupling the base of said first semi-conductor device with the collector of said second semi-conductor device, means providing a conductive charging path for said storage element, circuit means for receiving trigger pulses in said multivibrator circuit for rendering said semi-conductor devices non-conductive and to charge said storage element through said charging path, and a unilateral conducting element connected with the collector of said second semi-conductor device and poled for providing rapid discharge of said storage element through said devices and stable operation of said multivibrator circuit.

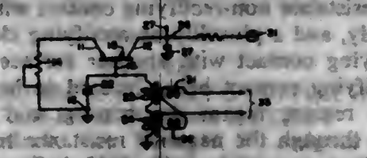


---

2,770,733
FREQUENCY STABILIZATION OF OSCILLATORS
Lowell E. Norton, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application April 2, 1951, Serial No. 218,807
7 Claims. (Cl. 250—36)

3. In a frequency-stabilizing system, a servo loop including oscillator means for generating signal frequencies

$\omega$ and $\omega \pm \Delta$, a frequency multipled connected to said oscillator means to provide the $n$th harmonic of one of said signal frequencies, a mixer connected to said multiplier to receive the output of said multiplier and a signal of standard frequency $\omega_s$ separately stabilized, thereby to produce a difference frequency, a comparator connected to said mixer to receive said difference frequency signal and connected to said oscillator means to receive one of the signal frequencies generated thereby to produce



an error signal, and oscillator stabilizing means connected to said oscillator means and connected to receive and be controlled by said error signal to stabilize one of said oscillator means signal frequencies, the signal frequency provided by the multiplier being $n\omega$ and said comparator having a selector in an input circuit of the comparator to provide for selective impression thereon of the signal frequencies $\omega$, $\omega \pm \Delta$ to shift the stabilized signal frequency $\omega$ to an extent corresponding to

$$\pm \frac{\Delta}{n+1}$$

---

2,770,734
TRANSISTOR RELAY DEVICE
Robert J. Reek, Bellwood, Ill., assignor to Teletype Corporation, Chicago, Ill., a corporation of Delaware
Application January 22, 1953, Serial No. 332,654
13 Claims. (Cl. 250—36)

1. In a relay device, a transistor, a control circuit connected to said transistor for causing the transistor to be maintained in a stable condition, an inductance having a variable impedance characteristic included in the control circuit, and means inductively coupled to said inductance for varying the impedance characteristic to cause said transistor to oscillate.

---

2,770,735
NON-POISONING MASS SPECTROMETER
John E. Clemens, near Xenia, and Ben B. Johnstone, Dayton, Ohio
Application May 9, 1955, Serial No. 506,828
10 Claims. (Cl. 250—41.9)

1. A mass spectrometer having a first chamber; an electron source within said chamber; a second chamber adapted to enclose a gas to be ionized by electrons from said source; and a window permeable to electrons but impervious to gas positioned between the chambers thereby separating the electron source from the gas to be ionized.

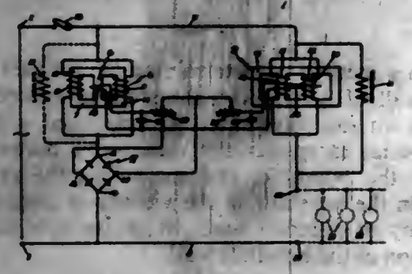
---

2,770,736
RADIOACTIVE METHOD FOR MARKING BOREHOLE FORMATIONS
Stanley Krasnow, Fairfax County, Va., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Delaware
Original application April 10, 1942, Serial No. 438,475, now Patent No. 2,692,494, dated April 8, 1952. Divided and this application March 12, 1952, Serial No. 276,194
10 Claims. (Cl. 250—83.6)

10. In a method of determining the amount of erosion of the wall of a borehole, the steps of exploding in the borehole an explosive material associated with radioactive material to spatter the radioactive material on the walls of the borehole, and measuring the radioactivity present in the borehole in the vicinity of the explosion at a plurality of different times to obtain data indicative of the erosion of the borehole wall.

---

2,770,737
MAGNETIC DELAY LINE
Robert A. Ramey, Jr., Pittsburgh, Pa.
Application May 12, 1955, Serial No. 508,892
15 Claims. (Cl. 307—88)
(Granted under Title 35, U. S. Code (1952), sec. 266)

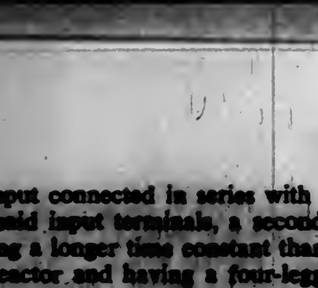


15. A magnetic ring timing circuit comprising a plurality of time delay stages coupled in endless series; each stage including at least a saturable magnetic core having a magnetizing and demagnetizing winding wound thereon, means including alternating supply voltage means for alternately applying magnetizing and demagnetizing voltage to said magnetizing and demagnetizing windings respectively in successive half-cycles; magnetizing voltage being applied to the magnetizing winding in a given stage and demagnetizing voltage being applied to the demagnetizing winding in the next succeeding stage in the same half-cycle; means for applying an initiating pulse in opposition to the demagnetizing voltage in one of said stages whereby in the next half-cycle the magnetizing voltage in said one stage causes saturation of the core therein resulting in the flow of saturation current through the magnetizing winding thereof; interstage coupling means responsive to the flow of saturation current in any stage to produce a voltage in opposition to the demagnetizing voltage in the next succeeding stage thereby to cause said next stage magnetizing voltage to saturate the associated core; and means for deriving an output timing pulse from each of said stages in accordance with saturation current flow therein.

---

2,770,738
STATIC ELECTRICAL PULSATION APPARATUS
Paul A. Vance, Columbia City, Ind., assignor to General Electric Company, a corporation of New York
Application December 5, 1955, Serial No. 550,987
18 Claims. (Cl. 307—88)

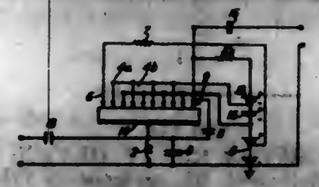
16. Static electrical pulsation apparatus comprising a pair of input terminals adapted to be connected to a source of alternating current, a first saturable core reactor having a three-legged core with a pair of alternating current gate windings respectively on the outer legs and a direct current saturating winding on the center leg thereof, said gate windings being connected in parallel, a bridge rectifier



having its input connected in series with said gate windings across said input terminals, a second saturable core reactor having a longer time constant than said first saturable core reactor and having a four-legged core with a pair of alternating current gate windings respectively on the center two legs thereof and a direct current saturating winding on said center two legs, said last named saturating winding having a lower impedance than said first named saturating winding, said last named gate windings being connected in parallel, a pair of output terminals,

said last named gate windings being connected between one of said input terminals and one of said output terminals, the other of said output terminals being connected to the other of said input terminals, said saturating windings being connected respectively across the output of said rectifier, variable resistors respectively connected in said series with each of said saturating windings, a capacitor connected across said first named saturating winding, and an inductance connected across said last named gate windings.

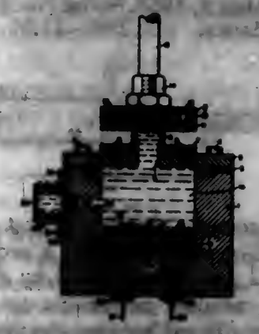
---



**2,770,739**
**TRIGGER CIRCUITS**
Harry Grayson and Rowland Arthur George Dunkley, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application February 15, 1954, Serial No. 410,394
Claims priority, application Great Britain February 17, 1953
7 Claims. (Cl. 307—88)

2. A magnetic counting circuit comprising a counting input circuit adapted to receive electrical pulses of relatively short duration to be counted, a first plurality of second-harmonic transformer arrangements, a second plurality of second-harmonic transformer arrangements, each of said second-harmonic transformer arrangements comprising a single second-harmonic transformer having a primary winding and first and second secondary windings, a first input connected to said primary winding and adapted to have alternating current applied thereto, a second input connected to said first secondary winding and adapted to have pulses of relatively short duration applied thereto, an output connected to said second secondary winding, said second secondary winding adapted to provide a path for an alternating current of a frequency which is an harmonic derivative of said alternating current applied to said first input, a feed-back circuit connected from said second secondary winding to said first secondary winding for passing current therebetween to produce a condition of sustained output, and means for rectifying current in said output, means for applying an alternating current to the first input of each of said first plurality of second-harmonic transformer arrangements in response to the arrival of a pulse to be counted at said counting input, means for applying an alternating current to the first input of each of said second plurality of second-harmonic transformers when there is no pulse at said counting input, and means for applying the rectified current in the output of each of said second-harmonic transformer arrangements to the second inputs of respective transformer arrangements of the other plurality of transformer arrangements, the order of transfer being from the first arrangement of the first plurality to the first arrangement of the second plurality, from the first arrangement of the second plurality to the second arrangement of the first plurality, and so on, whereby the arrival of pulses at said counting input is represented by a sustained output from successive transformer arrangements of said first plurality.

---

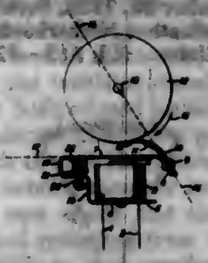


**2,770,740**
**ELECTRIC COUNTING DEVICES AND CIRCUITS EMPLOYING SEMI-CONDUCTORS**
Alec Harley Reeves and Reginald Benjamin Williams Cooke, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application October 10, 1952, Serial No. 314,662
Claims priority, application Great Britain October 12, 1951
8 Claims. (Cl. 307—88.5)

1. An electric pulse counting device comprising a body of semiconducting material having a base electrode making low resistance non-rectifying contact with one surface of the body, and a plurality of rectifying electrodes making rectifying contact with another surface of the body, each rectifying contact being formed to have a negative resistance region, means for biasing said rectifiers for operation through the negative resistance region and any pair of adjacent rectifying electrodes being so spaced that when the corresponding rectifying contacts are passing current in the forward direction, a change in current through one contact produces a change in current through the other.

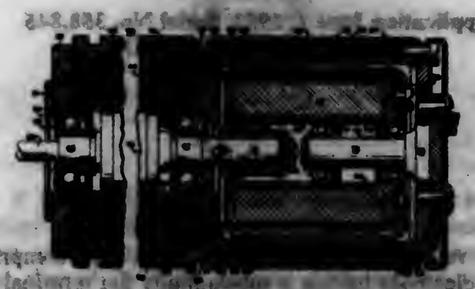
---

**2,770,741**
**VIBRATION PICKUP**
Milton P. Vera, Catonsville, Md., and Herbert M. Kroft, Venice, Calif., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application March 4, 1953, Serial No. 340,318
7 Claims. (Cl. 310—8.7)



1. A vibration pickup comprising, a rigid hollow pickup body having an opening therein, an electrical pressure sensitive transducer disposed in said pickup body, a flexible fluid-tight tubular member of small cross-sectional area relative to the cross-sectional area of the hollow portion of said hollow pickup body, said flexible tubular member being flexible in an axial direction and being stiff circumferentially to minimize changes in cross-sectional area of the flexible tubular member with variations in fluid pressure therewithin, a clamp means securing one end of said tubular member to said pickup body in fluid tight relation about said opening, a prod mount connected to and sealing the other end of said tubular member, and a relatively incompressible fluid filling said hollow pickup body and said tubular member.

---



**2,770,742**
**IMPULSE MOTOR**
Harry Fuchs, Jamaica, N. Y.
Application March 16, 1953, Serial No. 342,596
3 Claims. (Cl. 310—21)

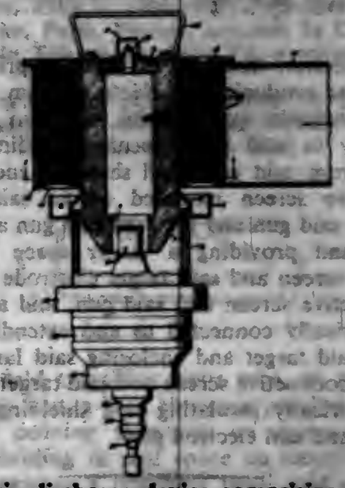
1. In an electro-mechanical device, a bracket structure having two legs and a section joining the two legs, an electroresponsive device secured to one leg adapted to vibrate the other leg, a resilient element positioned at the section joining the two legs and adapted to cushion the impact of said other leg upon its vibration by the electroresponsive device, and adjustable means associated with the resilient element adapted to vary the tension thereof.

---

**2,770,743**
**SERVO SYSTEM AND SERVO MOTOR WITH BUILT-IN DAMPING ACTION**
Bernard H. Walloch, New York, N. Y., assignor to Kearfott Company, Inc., Little Falls, N. J., a corporation of New York
Application October 12, 1954, Serial No. 461,816
4 Claims. (Cl. 310—74)

2. A servo motor with built-in viscous damping, comprising a motor having a motor with a main drive shaft on one end of the rotor and with a stub shaft extension on the other end of the rotor, both shafts being co-axially aligned on the rotor axis; and a damping device for the motor, said device consisting of a permanent magnet and a keeper radially spaced therefrom to define a cylindrical air gap concentric with the motor stub shaft, bearing means supporting the magnet and keeper for free rotation relative to the stub shaft, and a cylindrical cup supported on and secured to the stub shaft and extending into the cylindrical air gap for free rotation relative to the magnet.

---



**2,770,744**
**MAGNETIC POLE STRUCTURE**
Ralph M. Heintz, Los Gatos, Calif., assignor to Jack & Heintz, Inc., Cleveland, Ohio, a corporation of Delaware
Application April 20, 1953, Serial No. 349,633
8 Claims. (Cl. 310—216)

2. Pole structure for dynamo-electric machines comprising in combination, a plurality of laminations each having at least one arcuate edge, means for securing the laminations in stacked array with the arcuate edges thereof defining a common arcuate surface, a unitary retaining cup encasing the laminations with the arcuate surface formed thereby exposed through the mouth of the cup, and means for securing the laminations to the cup.

---

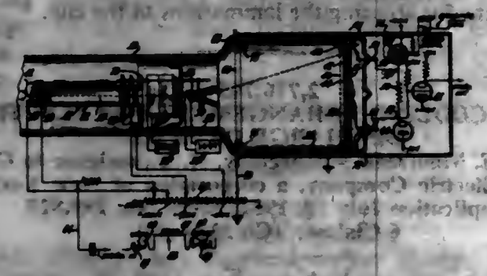
**2,770,745**
**FLUID COOLING ARRANGEMENT FOR ELECTRIC DISCHARGE DEVICES**
Robert E. Manfredi, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application July 19, 1951, Serial No. 299,820
6 Claims. (Cl. 313—44)

1. An electric discharge device comprising a cylindrical anode, a cylindrical insulator having a larger inner diameter than an outer diameter of said anode, a metal sealing ring bonded to said anode intermediate the ends thereof and to said insulator and having a heat radiating portion, and a radiator surrounding said anode and including a plurality of annular metal members mounted in a stack between said sealing ring and the outer end of said anode, the lower one of said annular members being adjacent said sealing ring and having apertures facing said portion to deflect cooling fluid toward said portion.

---

**2,770,746**
**CATHODE RAY TUBE AND TARGET**
Sidney Gray, New Brunswick, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application March 28, 1953, Serial No. 344,616
17 Claims. (Cl. 313—65)

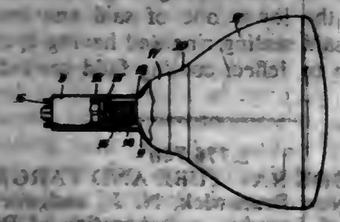
17. A ray sensitive target for a cathode ray tube, comprising an insulating support member, a plurality of



spaced conductive signal strips extending across said member, a plurality of bus bars on said member, sets of said signal strips each being connected to one of said bus bars, each of said sets of signal strips being insulated

from the other sets and the bus bars connected to said other sets, and a plurality of conductive finger strips each extending intermediate one of said signal strips and the bus bar connected thereto.

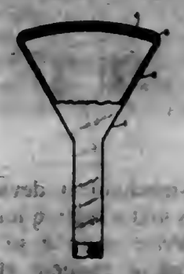
---



2,770,747
STORAGE TUBE
Arthur Seigfried Jensen, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application April 1, 1952, Serial No. 279,251
12 Claims. (Cl. 313—66)

1. An electron discharge device comprising, an electron gun for producing an electron beam along a path, a target electrode spaced from said gun and mounted transversely to said path, means shielding said target electrode from said gun, said shielding means including a conductive screen mounted across said beam path adjacent to said gun and between said gun and said target electrode and providing a larger space between said conductive screen and said target electrode than between said conductive screen and said gun, and a tubular electrode electrically connected to and extending from said screen to said target and enclosing said larger space between said conductive screen and said target electrode and means electrically insulating said shielding means from said target and said electron gun.

---



2,770,748
DEFLECTION SYSTEM
Kurt Schlesinger, Maywood, and Victor Graziano, Oak Park, Ill., assignors to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Application June 15, 1953, Serial No. 361,472
8 Claims. (Cl. 313—78)

1. An electrode structure for providing electrostatic deflection of a cathode ray beam including, a tubular support member having an opening therein through which the beam passes, four conducting electrodes symmetrically positioned with respect to each other on the surface of said opening in said member, each of said electrodes extending longitudinally of said tubular member and being of zigzag shape with apex portions extending in opposite direction around said tubular member and having an overall angular physical extent thereabout of substantially 270°, said electrodes being interleaved to provide a substantially continuous conducting coating on said surface, said electrodes having adjacent edges of complementary sinusoidal configuration so that the electrical field produced by applying a potential to alternate electrodes has an effective angular extent of substantially 180° and a substantially sinusoidal distribution through this extent.

---

2,770,749
CATHODE-RAY TUBE COMPRISING A LUMINESCENT SCREEN
Alfred Bril, Hendrik A. Klasens, and Pieter Zalm, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application October 30, 1952, Serial No. 317,716
Claims priority, application Netherlands August 21, 1952
1 Claim. (Cl. 313—92)

In a cathode-ray tube with a decay time shorter than $10^{-8}$ seconds and emitting ultra-violet radiation, the spectral distribution of which exhibits a maximum at about 2900 A., including an envelope having a quartz window at one end and means for producing a beam of electrons within said tube, a luminescent screen consisting of self-activated zirconium pyrophosphate.

---

2,770,750
LOW TENSION SURFACE DISCHARGE SPARK PLUG
Wytze Reye Smits, Voorburg, Netherlands, assignor to Smitsvonk N. V., Leidschendam, Netherlands, a company
Application June 1, 1953, Serial No. 358,845
1 Claim. (Cl. 313—131)

A low voltage surface discharge spark plug comprising an inner electrode having a substantially flat terminal portion, an insulating separator body surrounding said inner electrode and having an end face extending substantially contiguously with the terminal portion of the inner electrode, and an outer electrode disposed concentrically with respect to the inner electrode and the separator body, the outer electrode having a terminal portion extending contiguously with the terminal portion of the inner electrode, said insulating separator body being in contact with both said terminal portions, spaced recesses formed in the terminal portions of the inner and outer electrodes and in the end face of the separator body, said recesses being in communication with each other and permitting expansion and contraction of the electrodes.

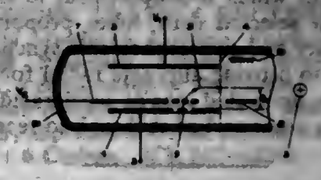
2,770,751
CONSTRUCTION OF GAS-FILLED TUBES, PARTICULARLY SHIELDING
Hans John Fraser, Maplewood, and William Curtis Dale, Basking Ridge, N. J., assignors to Radio Corporation of America, a corporation of Delaware
Application February 27, 1953, Serial No. 339,202
7 Claims. (Cl. 313—199)

1. A gas discharge device, comprising a sealed envelope having an ionizable medium therein, a pair of spaced apart insulator members within said envelope, a cathode, a control electrode and an anode supported in spaced relationship between said insulator members, said electrodes extending through both of said insulator members, a different lead-in conductor connected to one of the extended portions of each of said electrodes and sealed through said envelope, a metallic member intermediate the lead-in conductor for said anode and the lead-in conductor for said cathode and extending from one of said insulator members substantially to said envelope, a third insulator member, a U-shaped metallic member extending from the other of said insulator members to said third insulator member and intermediate the other extended portion of said anode and the other extended portion of said cathode.

---

2,770,752
INSULATED SHIELDING STRUCTURE FOR GASEOUS DISCHARGE TUBE
Donald V. Edwards, Montclair, and William P. Kruger, Morristown, N. J., assignors to Electrons, Incorporated, Newark, N. J.
Application January 26, 1952, Serial No. 268,391
7 Claims. (Cl. 313—206)

1. A gaseous discharge tube comprising, an evacuated envelope containing a gaseous medium, an anode having a lead sealed in said envelope, a shield of imperforate metal shaped to have a short path spacing from said anode and from its lead, and a joint between the boundary edges of said shield and said anode lead, said joint including an element of material of very slight electrical conductivity in contact with the shield and the anode lead, the shortest path through said material between said shield and said lead being greater than said short path spacing, thereby affording a dimension of said material capable of withstanding without break-down relatively high differences of potential, said element being effective to establish surface potentials influencing the electric field in the region of said joint, whereby the effect of said short path spacing is extended into the region of said joint.

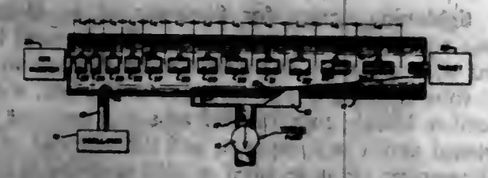


2,770,753
TIGHTENING MEMBER FOR FILAMENTS
Gerard Meesker, Eindhoven, Netherlands, assignor to Hartford National Bank and Trust Company, Hartford, Conn., as trustee; patent dedicated to the Public insofar as it relates to lamps and lamp parts to the extent stated in document recorded in the United States Patent Office April 13, 1954
Application October 16, 1952, Serial No. 315,079
Claims priority, application Netherlands November 23, 1951
5 Claims. (Cl. 313—278)

1. A tightening device for filaments of an electrical apparatus comprising a support, a securing element being provided with a linking member fixedly secured to said support thus forming a unitary structural piece, a resilient member having part thereof adjacent one end helically wound about said support, and the one end of said resilient member being secured to said securing element, and a stay pole, means connecting said securing element to said stay pole.

---

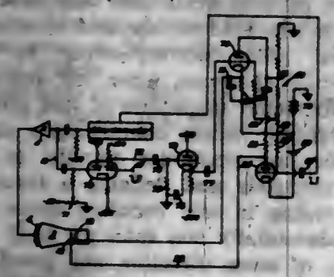
2,770,754
TRANSVERSE FIELD TRAVELLING WAVE TUBE
Daniel Charles, Paris, France, assignor to Compagnie Generale de Telegraphie Sans Fil, a corporation of France
Application January 11, 1951, Serial No. 205,589
Claims priority, application France January 20, 1950
2 Claims. (Cl. 315—3.5)



2. A cross-field travelling wave tube, of the type including a delay line, a base electrode parallel to said delay line and defining therewith an interaction space, means for providing in said space an electric field and means for providing a magnetic field, said electric and magnetic fields being perpendicular to each other and to the direction of said delay line and base electrode, whereby there is provided within said interaction space an equipotential plane corresponding to the mean velocity with which electrons, when fed into said space, propagate therein under the action of said crossed fields, said tube comprising: means comprising a cathode and two electron focusing electrodes, parallel to said delay line and base electrode and defining a focusing space; means for providing in said focusing space a uniform electric field substantially less than the field in said interaction space, of same direction and parallel thereto, and for providing the same magnetic field therein as in said interaction space; said cathode being positioned to feed electrons into said focusing space in a direction perpendicular to said focusing electrodes and parallel to the direction of said electric field, the distance between the center of said cathode and the plane of entry of said electrons into said interaction space being substantially equal to half the chord of an arch of the cycleidal path

imparted to said electrons in said focusing space under the action of said fields, the distance between said equipotential plane and a parallel plane, passing through said cathode, being equal to the algebraic sum of the distance between said base electrode and the equipotential plane of same potential value in the focusing space and of the distance between said base electrode and said parallel plane, and said focusing electrodes being positioned for delivering said electrons into said interaction space as soon as they leave said focusing space; a grid parallel to said focusing electrodes and positioned therebetween; a terminal connection for applying a control potential to said grid; and means for controlling the field in said focusing space as a function of said grid control potential.

---



2,770,755
LINEAR ACCELERATOR
Myron L. Good, Berkeley, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application February 5, 1954, Serial No. 408,630
4 Claims. (Cl. 315—5)

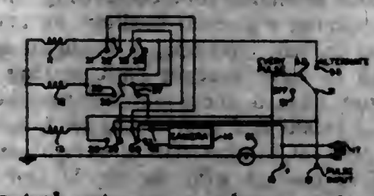
1. In a linear accelerator for charged particles, the combination comprising an elongated air-tight tank, evacuating means associated with said tank, a plurality of drift tubes disposed axially in spaced apart relation in said tank, a sinusoidal radio-frequency oscillator coupled to said tank for producing an axial electric field, injector means disposed at one end of said tank for projecting ions in a beam along the axis thereof during the decreasing portion of the excitation cycle of said oscillator to provide a radially focused beam, the length of said drift tubes along the path of said ion proportional to a synchronous length which is proportional to the velocity of said ions with selected drift tubes proportionately and alternately lesser and greater than said synchronous length in such order to provide alternate radial focusing and defocusing forces upon said ions as accelerated, and a target disposed at the other end of said tank to receive said ions.

---

2,770,756
AUTOMATIC BEAM STABILIZATION
Rudolph J. Klein, Downers Grove, Ill., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application June 16, 1953, Serial No. 362,086
5 Claims. (Cl. 315—22)

2. In a memory system comprising a cathode ray tube, a pick up plate coupled to the screen thereof, an amplifier coupled to said plate, means for establishing an electron beam within said tube, electrodes for deflecting said beam about said tube to a raster of position responsive to a series of control voltages, and a grid for controlling the intensity of said beam; the improvement comprising a grid driver stage provided with input and output circuits, said output circuit being coupled to said grid for determining the voltage impressed thereon, a difference amplifier having two input circuits and an output circuit, said output circuit being coupled to the input of said driver stage, one input being coupled to said amplifier output circuit, first and second sources of reference potentials coupled respectively to said input circuits of the difference amplifier a source of reference voltage pulses coupled to the other input of the driver stage, a clock pulse generator coupled to said source of reference pulses for timing said pulses, and means responsive to said clock pulse generator for periodically directing said beam to a selected raster position to produce a reference signal for said difference amplifier.

---



2,770,757
ARRANGEMENTS FOR THE PROTECTION OF CABLES AGAINST SHORT-CIRCUIT CURRENTS AND AGAINST OVERLOADING
William S. Edsall, Boston, Mass., assignor to The Chase-Shawmut Company, Newburyport, Mass.
Application March 13, 1953, Serial No. 342,113
3 Claims. (Cl. 317—40)

1. An arrangement for the protection against short-circuit currents and against overloading of electric conductors which are insulated by an organic insulating material comprising an electric circuit, a conductor having a metallic current-carrying core and an organic insulating covering enveloping said core arranged in said circuit, a current-limiting fuse for the protection of said conductor against short-circuit currents also arranged in said circuit, and an additional circuit interrupting device for the protection of said conductor against overloading arranged between sections of said conductor in series with said sections and in series with said current-limiting fuse, said additional circuit interrupting device being directly responsive to the temperature of said core of said conductor and including a pair of separable contacts normally spring-biased to the open position thereof and held in closed position by solder means conductively interconnecting said pair of contacts, the losses in said core of said conductor being virtually the only source of heat controlling the response of said additional circuit interrupting device.

---

2,770,758
RELAY CIRCUIT
Richard C. Babbit, Boston, Mass., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application November 26, 1945, Serial No. 630,946
6 Claims. (Cl. 317—140)

1. In a control system responsive to an input signal of recurrent, intermittent electrical pulses to control a device mechanically operative when electrically energized and adapted for selectively energizing said device with all of said signal pulses or with alternate signal pulses, apparatus comprising a source of power, three normally de-energized electrically interlocked contact carrying relays, the first of said relays having a time delay equal to a fraction of the time duration of a signal pulse, means responsive to a first signal pulse to energize said first and second relays, means controlled by said energized second relay to hold said second relay energized for the time duration of a first signal pulse, means controlled by said first relay on being energized by said first signal pulse and operative after said time delay in connection with said power source to hold said first relay energized after said first signal pulse, and to energize the third of said relays upon the application of a second signal pulse through the contacts of said energized first relay, means controlled by said energized third relay to energize said device for the time duration of said second signal pulse and to de-energize said first relay, said second relay and said first relay time delay precluding the energization of said third relay by said first signal pulse.

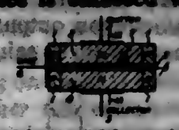
---

2,770,759
MAGNETIC ASSEMBLY
Axel W. Ahlgren, Rockford, Ill., assignor to Amerock Corporation, a corporation of Illinois
Application February 8, 1955, Serial No. 486,776
4 Claims. (Cl. 317—199)

2. In a magnetic assembly, the combination of, a housing of non-magnetic material having front and side walls and open at the rear, a permanent magnet bar loosely placed and longitudinally disposed within said housing, pole pieces of magnetic material abutting against the ends of said magnet and projecting outwardly through said front wall, a backing plate extending across the open rear of said housing to hold said magnet and said pole pieces in the housing, detents projecting inwardly from the side edges of said plate intermediate the ends thereof, and lugs rigid with said side walls and engaged by said detents to hold said plate in place, said plate being weakened to bend along transverse lines disposed between said detents and the ends of said magnet whereby the end portions of the plate may be bent along said lines without disengaging the detents and the lugs.

---

2,770,760
MECHANICAL VIBRATOR
Austin N. Stanton, Garland, Tex.
Application August 11, 1953, Serial No. 373,567
5 Claims. (Cl. 317—182)



1. A mechanical vibrator including: an annulus of resilient magnetic substance; and means for supporting said annulus at four substantially equally spaced points along one edge of said annulus, opposed sections of said annulus being resiliently movable toward and away from one another about four nodes disposed at said points.

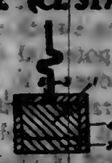
---

2,770,761
SEMICONDUCTOR TRANSLATORS CONTAINING ENCLOSED ACTIVE JUNCTIONS
William G. Pfann, Basking Ridge, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 16, 1954, Serial No. 475,709
9 Claims. (Cl. 317—235)

1. A semiconductor translating device comprising a body of semiconductive material, having therein a zone of one conductivity type in contact with a zone of a second conductivity type, in which the junction common to the two said zones is enclosed within the said body,

together with means for making electrical contact to at least one of the said zones and means for making electrical contact to at least one other portion of the said body.

---

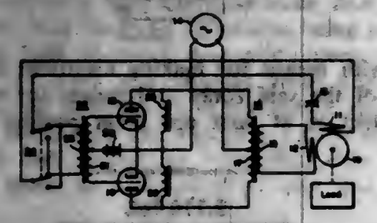


2,770,762
CRYSTAL TRIODES
Charles du Belaunoise White and Kenneth Albert Matthews, London, England, assignors to International Standard Electric Corporation, New York, N. Y.
Application March 28, 1950, Serial No. 152,301
Claims priority, application Great Britain April 1, 1949
11 Claims. (Cl. 317—235)

1. An electric amplifying device comprising a semiconducting body adapted to be used in a point-contact rectifier, a plurality of point-contact electrodes making contact with said body, a pair of said electrodes being emitter and collector electrodes with respect to each other and each making contact with said body close to the other, and a third one of said electrodes in contact with said body at a distance from said pair of electrodes exceeding that at which it can act as either emitter or collector electrode with respect to either of said pair of electrodes.

---

2,770,763
ELECTRIC CRYSTAL RECTIFIERS
Kenneth Albert Matthews, London, England, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application August 1, 1952, Serial No. 302,065
Claims priority, application Great Britain August 29, 1951
6 Claims. (Cl. 317—236)



1. An electric crystal rectifier comprising a semiconducting body of given conductivity type and having on its surface a layer of the opposite conductivity type, an electrode making low resistance substantially non-rectifying contact with part of the said layer, a thin film of said given conductivity type over a limited area of another part of said layer, and a second electrode making rectifying contact with the said thin film, the two electrodes being spaced apart by a distance of between 0.001 and 0.01 inch.

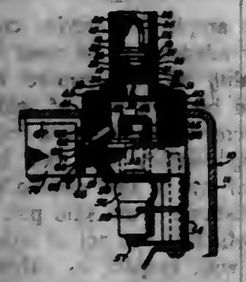
---

2,770,764
LOAD CONTROL WITH SINGLE CONTROL TUBE
Colin H. McArdle, Baltimore, and Charles Keith Hooper, Linthicum Heights, Md., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application February 8, 1954, Serial No. 408,762
6 Claims. (Cl. 315—207)

1. A control circuit comprising a high vacuum electron emplifying tube having a control electrode, a cathode

and an anode; an input transformer having a primary winding for connection to a source of alternating current, and having a secondary winding connected to said control electrode and cathode; an output transformer having a primary winding connected to said anode, and having

a secondary winding for connection to a load; connections for applying an alternating current difference of potential between said primary winding of said output transformer and cathode, and an inductor connected directly between said anode and cathode.



---

**2,770,765**

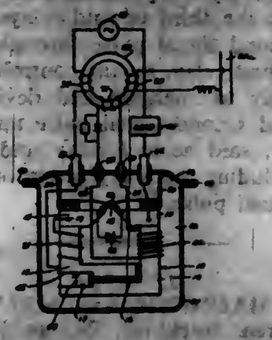
**DOSIMETER CHARGING UNIT**

Robert W. Negus, Monrovia, Calif., assignor to Arnold O. Beckman, Inc., South Pasadena, Calif., a corporation of California

Application January 12, 1954, Serial No. 403,540
13 Claims. (Cl. 320—1)

1. A dosimeter charging unit for charging a dosimeter having an electroscope and an electroscope charging switch within a housing, said charging unit including: an enclosure; a switch actuating post; insulation means for fixedly attaching said post to said enclosure, said post being formed of electrically conducting material and being shaped to actuate said charging switch upon relative movement of said electroscope housing and said enclosure toward each other; a source of charging potential in said enclosure; an operating switch operating when actuated to supply a charging potential from said source to said post; and means responsive to such relative movement for actuating said operating switch during a first part of such relative movement to supply said charging potential to said post, said source of charging potential including a step-up transformer having a primary winding and a secondary winding, a rectifying means connecting said secondary winding to said post for supplying said charging potential thereto, a battery, and a vibrator actuated by energization of said primary winding and providing contacts connected serially with said primary winding, said battery and said operating switch.

---



**2,770,766**

**MAGNETIC RECTIFIER**

Fritz Kesselring, Zollikon, Zurich, Switzerland, assignor to FKG Fritz Kesselring Gerätebau A. G., Bachtobel-Wetzikon, Thurgau, Switzerland, a corporation of Switzerland

Application June 27, 1952, Serial No. 296,011
6 Claims. (Cl. 321—48)

1. An electromagnetic switch comprised of a magnetic structure, an armature, and a conductor; said conductor being comprised of a first and a second member positioned in alignment and spaced a predetermined distance from each other; said magnetic structure surrounding said first and second member; said magnetic structure having an air gap in alignment with the space between said first and second member; an armature comprised of a magnetic portion and a conducting portion; said armature positioned in alignment with the gap of said magnetic structure and a space between said first and second member;

said armature having an engaged and disengaged position; said magnetic portion of said armature bridging the gap of said magnetic structure when said armature is in said engaged position; said conducting portion of said armature bridging the space between said first and second member when said armature is in said engaged position.

---

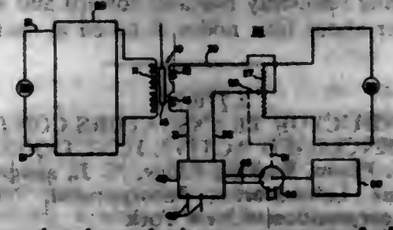
**2,770,767**

**WINDING ARRANGEMENT USING A TERTIARY WINDING**

Robert A. Nelson, Rome, Ga., assignor to General Electric Company, a corporation of New York

Application December 14, 1954, Serial No. 475,119
8 Claims. (Cl. 323—43.5)

1. A winding for a transformer comprising a helically wound high current winding having a plurality of parallel connected stacked insulated conducting strands, said strands being transposed to reduce circulating currents, a helically wound tapped tertiary winding wound adjacent to said high current winding and conducting means connecting one end of said high current winding to the adjacent end of said tertiary winding.



---

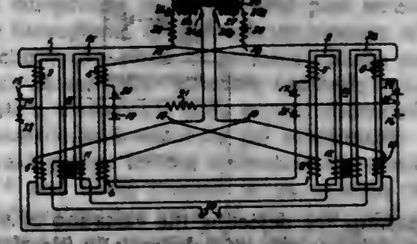
**2,770,768**

**SIGNAL GENERATING APPARATUS**

Frank M. Exner, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application December 29, 1952, Serial No. 328,487
15 Claims. (Cl. 323—51)

15. In a signal producing apparatus of the induced voltage type, a magnetic core structure with an air gap therein and magnetic operating means positioned in said air gap and movable relative thereto, an energizing winding and an output winding mounted on said core structure, said output winding being adapted to have a voltage induced therein in proportion to the movement of said magnetic operating means, an energizing circuit means connected to said energizing winding and adapted to be connected to an alternating current source of power, and a correcting network means including a transformer having a magnetic circuit with a portion simulating the magnetic circuit of said signal producing device and having primary and secondary windings thereon with a resistor connected to the output winding of the transformer and in series with a reactor, said resistor being further connected in series with said energizing windings of said signal producing apparatus across said alternating current source with said primary winding energized from said alternating current source to correct for phase displacement originating in the energizing circuit means and said energizing winding and in the magnetic core structure of said signal producing device to align the phase of the induced voltage in the output winding with the voltage of said source of supply, and further inductive means included in said connecting network and mounted on said magnetic circuit of said transformer comprising a pair of windings, one of which is connected in series with said transformer secondary and said reactor and the other is connected in series with said resistor for correcting for harmonic distortion present in the induced voltage of said output winding of said signal producing apparatus.



---

**2,770,769**

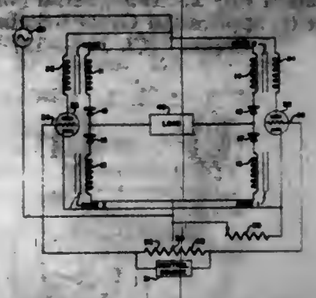
**PUSH-PULL MAGNETIC AMPLIFIER**

Walter R. Seeguiller, Scotia, N. Y., assignor to General Electric Company, a corporation of New York

Application November 12, 1952, Serial No. 320,061
7 Claims. (Cl. 323—89)

1. A self-saturating push-pull magnetic amplifier for connection to a source of alternating electric current supply comprising a pair of direct current signal terminals, a pair of saturable reactor devices each having a pair of reactor windings and a direct current saturating winding, means connecting said reactor windings in a bridge circuit having four arms with each said pair of reactor windings in opposite arms of the bridge, said bridge having input terminals for connection to said source of alternating current supply and output terminals intermediate said input terminals for connection to a load, a rectifier connected in each arm of said bridge, said rectifiers being poled to conduct current in one direction only between said input terminals, a ballast resistor in series with said bridge input terminals and having a direct current impedance equal to the impedance of said load, and means connecting said saturating windings in series circuit relation between said signal terminals.

---



**2,770,770**

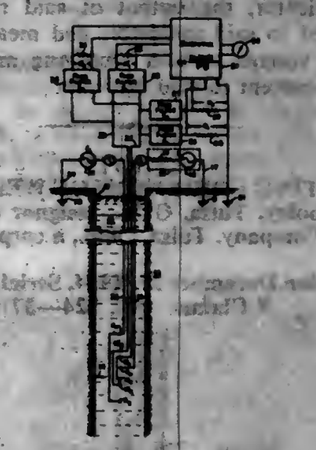
**VACUUM TUBE CONTROLLED MAGNETIC AMPLIFIER**

Carroll W. Lafey, Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Navy

Application May 22, 1953, Serial No. 356,915
3 Claims. (Cl. 323—89)

4. A half-wave magnetic amplifier comprising four impedance elements, at least two of said impedance elements comprising controlled windings each wound on a core of saturable magnetic material, means connecting the controlled windings to form separate parallel branch circuits therewith, each of said branch circuits including one of said controlled windings, means including a source of A. C. potential having one side connected to said controlled windings and the other side connected to said first mentioned means for applying an A. C. potential to said branch circuits, unidirectional impedance elements connected in said branch circuits and arranged so that current flows through said controlled windings only during

one half cycle of said A. C. potential, a control winding on each of said cores, a pair of tubes each having a plate, a control grid and a cathode, means connecting the plates of each of said tubes to one of said control windings, means connecting the cathodes of said tubes to each other and to a cathode biasing resistor, means connecting said source of A. C. potential to said control windings and to said biasing resistor whereby current flows through said control windings during the other half cycle of said A. C. potential, and means for applying a control signal to the grids of said vacuum tubes.



---

**2,770,771**

**WELL LOGGING METHODS AND APPARATUS**

Nick A. Schuster, Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Delaware

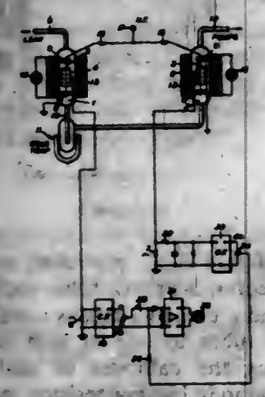
Application June 6, 1952, Serial No. 292,073
14 Claims. (Cl. 324—1)

1. In a method of investigating an electrical characteristic of earth formations traversed by a bore hole containing electrically conductive liquid, the steps of creating a first electric field having components directed oppositely along the bore hole and emanating from a first location therein, creating a second separably measurable electric field having components directed oppositely along the bore hole and emanating from each of second and third locations in the bore hole above and below said first location, respectively, picking up first signals representative of the absolute potential with respect to ground of one of said fields at a location in the vicinity of said first location, picking up second and third signals representative, respectively, of the potential gradients along the

bore hole in each of said fields in a region near one of said locations, and producing a signal that is a function of the product of said first signal and the ratio of said second and third signals.

---

2,770,772



**DETECTION OF LEAKS IN VACUUM APPARATUS**

Christopher Henry Fenkes and Ernest James Blythe, London, England, assignors to International Standard Electric Corporation, New York, N. Y.

Application July 23, 1953, Serial No. 369,806

Claims priority, application Great Britain July 29, 1952

1 Claim. (Cl. 324—33)

Apparatus for the measurement and detection of leaks in a vacuum system comprising a pair of cold cathode magnetron ionization gauges, a probe gas filter, one of said gauges being adapted to be connected directly to the system under test and the other connected via said filter, means for setting up an alternating magnetic field axially of the cathode in each gauge so that the output of said gauges is in the form of pulses, and means for comparing the pulse output of the two gauges, said means comprising a rectifier coupled to the output of the gauge following the filter and producing a biasing voltage output, rectifying means connected to the output of the gauge connected directly to the system of the test, an indicator, the output of said rectifying means being applied to said indicator, and means for applying the biasing voltage to said rectifying means to control the flow of current to said indicator.

---

2,770,773

**DETECTING CORROSION OF WELL CASING**

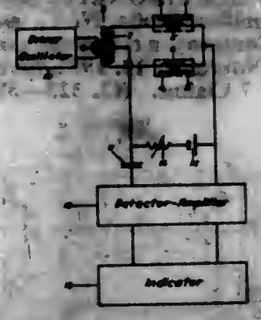
Elihu H. Cooley, Tulsa, Okla., assignor to Stanolind Oil and Gas Company, Tulsa, Okla., a corporation of Delaware

Application December 27, 1954, Serial No. 477,814

9 Claims. (Cl. 324—37)

2. In a system for detecting corrosion pits in a cylindrical ferromagnetic wall such as a well casing, the combination comprising a ferromagnetic armature parallel to the cylindrical axis of said wall having at its ends pole pieces shaped to fit the contour of said wall, at least one magnetizing-current winding on said armature and a source of direct current connected to said winding, whereby a steady magnetic flux can be created which substantially saturates the portion of said wall adjacent and between said pole pieces, a plurality of magnetic-flux-responsive elements about midway between said pole pieces spaced along an arc adjacent said wall and perpendicular to said cylindrical axis, each of said flux-responsive elements including a coil, a plurality of electrical bridge circuits each having two of said coils in adjacent impedance arms, a source of alternating current connected across one diagonal of each of said bridge circuits, a plurality of filtering and demodulating circuits, each connected across the other diagonal of one of said bridge circuits, each of said filtering and demodulating circuits being adapted to select and transmit substantially only those output signals of said bridge circuit having characteristics of frequency and amplitude variation which are related to the rate of movement of said flux-responsive elements past corrosion pits at a given speed, and means for producing an indication of the variations in output of said filtering and demodulating circuits.

---



2,770,774

**BALANCED MAGNETOMETER**

Henry B. Ribbet, Kinderhook, N. Y., assignor to the United States of America as represented by the Secretary of the Navy

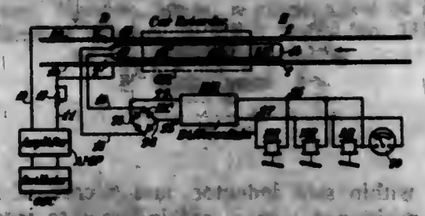
Application May 16, 1944, Serial No. 534,961

2 Claims. (Cl. 324—43)

1. Apparatus for detecting the variation of a magnetic field comprising a pair of substantially identical magnetometer elements each having a magnetic core and a winding, a transformer having a center-tapped secondary, said windings being so disposed that their magnetic axes are parallel and said windings are so connected in a series with said transformer secondary that similar poles of the cores are oppositely directed, means for operating said transformer to provide substantial saturation voltages in said windings, output terminals connected to the junction of said windings and to said center tap for delivering an output signal whose characteristics are dependent upon the magnetic field surrounding the detecting apparatus, a source of direct current connected across said terminals through a potentiometer, and means for detecting the output signal impulses to indicate any change in the surrounding magnetic field.

---

2,770,775



**WAYSIDE VEHICLE SPEED DETERMINING BRAKE**

Edward J. Agnew, Swissvale, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania

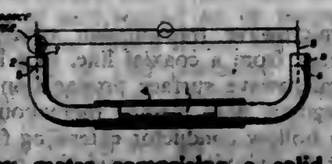
Application December 21, 1951, Serial No. 262,831

15 Claims. (Cl. 324—70)

1. The method of determining the speed of a railway vehicle as it progresses between two fixed points spaced along a railway track, comprising the steps of creating an alternating voltage which progressively varies from a first to a second value as the vehicle moves from a first one to the second one of the fixed points, said voltage being created due to the inductive relation between a track circuit including the track rails between the two

fixed points and a loop circuit including a conductor mounted along at least one of the track rails of the track circuit, and detecting the slope of the envelope of the magnitude of the created voltage.

---



2,770,776

**FREQUENCY METER**

Walter Juda, Lexington, and Wayne A. McRae, Arlington, Mass., assignors to Ionics, Incorporated, Cambridge, Mass., a corporation of Massachusetts

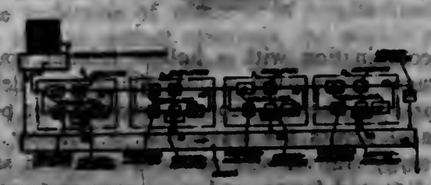
Original application July 9, 1949, Serial No. 103,784, now Patent No. 2,636,851, dated April 28, 1953. Divided and this application April 14, 1953, Serial No. 348,722

1 Claim. (Cl. 324—78)

A frequency meter comprising a solid unfractured structure comprising as an essential part extending substantially throughout, a predominant amount of a homogeneous continuous phase of an ion exchange resin which comprises: an insoluble infusible synthetic organic polymeric matrix, dissociable ionic groups chemically bonded to said matrix, and water in gel relationship with said matrix; said groups having a dissociation constant of at least $10^{-9}$ and being present in an amount of at least 0.3 milliequivalent per gram of dry resin, and said water being present in an amount of at least 15% of the weight of dry resin, a pair of spaced metallic conductors in direct contact with said solid unfractured structure, and means for measuring impedance of said structure whereby the frequency may be determined.

---

2,770,777



**IMPULSE TRANSMISSION SYSTEMS**

Henri Feissel, Paris, France, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware

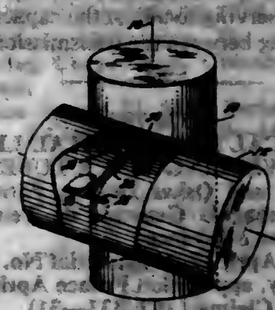
Original application October 23, 1948, Serial No. 56,243, now Patent No. 2,651,716, dated September 8, 1953. Divided and this application April 7, 1953, Serial No. 347,195

Claims priority, application France November 8, 1947

3 Claims. (Cl. 332—1)

1. An electrical translator for converting amplitude modulated pulses to corresponding binary pulse code groups comprising a cascade of circuits each having an output equal to $2(V_2-V_r)$, for $V_1$ greater than $V_r$ and equal to $2V_1$ for $V_1$ less than $V_r$ where $V_1$ is the input voltage pulse and where $V_r$ is given reference voltage, means to apply said amplitude modulated pulses to the first circuit of said cascade, and means to produce at each circuit of said cascade a corresponding member of said pulse code group only when $V_1$ is greater than $V_r$.

---



2,770,778

**SLOT COUPLING FOR TANGENT CIRCULAR WAVEGUIDE STRUCTURES**

William N. Parker, Lancaster, Pa., assignor to Radio Corporation of America, a corporation of Delaware

Application April 27, 1951, Serial No. 223,325

32 Claims. (Cl. 333—6)

1. In combination, two waveguiding structures each having walls including a curved wall enclosing a waveguiding space and with said curved walls tangential at a common wall portion at substantially a single point only of tangency, said structures having a mode of excitation at an operating frequency with non-parallel directions of wall current flow at said common wall portion, each said structure having an elongated slot in its walls which slot passes through said common wall portion and has a central longitudinal line coplanar with the like line of the other said slot, the direction of said line being inclined at an angle between 0° and 90° to the direction of said current flow in at least one of said structures, and a hollow passageway extending between said structures and enclosing said slots for coupling wave energy in said spaces.

---

2,770,779

**DIRECTIONAL COUPLER**

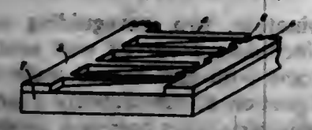
Thomas F. Turner, San Jose, Calif., assignor, by mesne assignments, to Sierra Electronic Corporation, San Carlos, Calif., a corporation of California

Application February 8, 1951, Serial No. 209,931

2 Claims. (Cl. 333—10)

1. In a directional coupler of the character described, a first transmission line section having straight coaxial center and outer conductors and adapted to conduct high frequency over a substantial frequency range, a second transmission line section disposed alongside the first section and having straight coaxial center and tubular conductors parallel to the first named conductors, the tubular conductors of the two sections having a common conducting wall located intermediate the center conductors, said common wall having a single coupling opening therethrough whereby the transmission line sections are coupled together with magnetic and capacitive components,

said opening being of a size which is small compared with ½ the wavelength of frequency in said range and having its central axis at right angles to the center conductors, the length of the opening in the direction of the conductors being not greater than its width, and a cylindrical shaped coupling member formed of conducting material extending in alignment with said axis, said coupling member being adjustably mounted on one of the center conductors for adjustment axially of said opening to advance or retract to one end thereof with respect to the other center conductor, said coupling member being dimensioned whereby when it is advanced to a position within the opening a free space is provided between the same and the periphery of said opening through which the transmission lines are magnetically coupled, adjustment of said coupling member serving to adjust the capacitative component of the coupling between the transmission line sections.



---

**2,770,780**

**SYMMETRICAL INTERDIGITAL LINE FOR TRAVELLING WAVE TUBES**

Robert Warnecke and Oskar Doehler, Paris, France, assignors to Compagnie Generale de Telegraphie Sans Fil, a corporation of France

Application April 17, 1952, Serial No. 282,761
Claims priority, application France April 23, 1951
6 Claims. (Cl. 333—31)

1. A delay line adapted for use for the introduction of delay in the phase propagation of ultra high frequency waves in the direction of its axis, said line comprising two symmetrical comb-like members having alternately interleaved fingers and a common plate extending parallel to the plane of said members, said members being carried on said plate, an interval being provided between at least all but the bases of the fingers and the plate, the distance between said fingers and said plate not exceeding 0.5% of the wavelength of said ultra high frequency wave.

---

**2,770,781**

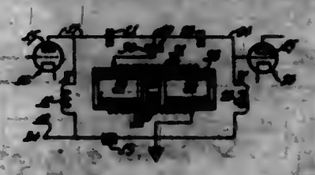
**WAVE DELAYING STRUCTURE FOR RECTANGULAR WAVE-GUIDES**

Robert Bruce Robertson-Shersby-Harvie, Great Malvern, and John Dain, Abingdon, England

Application July 16, 1951, Serial No. 236,932
1 Claim. (Cl. 333—31)

A loaded waveguide comprising an elongated flat metal sheet arranged in a central plane of the guide and formed with a series of transverse inductive slots such that each face present an inductive impedance to the guide and similar slow waves may be propagated in the guide on each side of the sheet wherein said sheet is thickened near the center of the slots to increase the self capacity of the slots, but while leaving the sheet adjacent the ends of the slots at substantially the same thickness as the remainder of the sheet.

---



**2,770,782**

**FREQUENCY SELECTIVE COUPLING SYSTEM**

Walter van B. Roberts, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application August 30, 1952, Serial No. 307,304
6 Claims. (Cl. 333—71)

1. A band-pass filter circuit comprising three tuned branches connected in electrically parallel relation without mutual inductance coupling therebetween, one of said branches comprising a capacitor and an inductor in series, an annular resonator of magnetostrictive material

disposed within said inductor, and a core of magnetic material positioned within said inductor to increase the magnetic coupling between said inductor and said resonator.

---

**2,770,783**

**SURFACE WAVE TRANSMISSION LINE**

Andre G. Clavier, Nutley, N. J., and David L. Thomas, Lee, London, England, assignors to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware

Application May 23, 1953, Serial No. 163,581
5 Claims. (Cl. 333—95)

1. In a microwave transmission system, means for coupling energy from a coaxial line, to a line conductor capable of microwave surface propagation by means of an electromagnetic field formed thereabout, said means comprising a hollow conductor extending from the outer conductor of the coaxial line, said line conductor being extended into said hollow conductor, said hollow conductor being decreased gradually in thickness toward the end remote from the coaxial line, whereby the conductance thereof is gradually decreased and insulating material disposed about said line conductor within said hollow conductor to constrict substantially the radial extent of the electromagnetic field as it is propagated from the coaxial line to the line conductor.

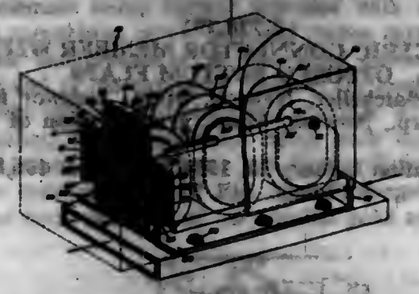
**2,770,784**

**METAL PAINTED APERTURE OR WINDOW FOR WAVEGUIDES**

Robert H. Hatch, Massapequa Park, N. Y., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Application June 25, 1952, Serial No. 295,540
8 Claims. (Cl. 333—98)

1. In combination with a hollow tubular waveguide, a diaphragm comprising a metallic frame defining a window area and being adapted along its outer periphery to be sealed across the waveguide, a window of nonporous energy transmissive material seated in said area and sealed to said frame, and an energy obstructive configuration of metallic paint described on the exposed surface of said window distal to said frame, said configuration being readily altered by the removal of metallic paint from and the addition thereof to said window.



**2,770,785**

**DIRECTLY-COOLED ELECTROMAGNETIC COMPONENTS**

Robert G. Haagsma, Concord, and Leonhard Katz, Weston, Mass., assignors to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware

Application January 29, 1953, Serial No. 333,954
4 Claims. (Cl. 336—61)

1. In an electromagnetic component having a laminated magnetic core and at least one current-carrying winding surrounding said core, a first set of thermally-conductive spaced laminations and a second set of thermally-conductive spaced laminations, said laminations of said first and second sets being positioned between said core laminations and having outer portions located externally of said core, said outer portions of said first set of laminations being connected together to form a first heat-conductive path on one side of said laminated core, said outer portions of said second set of laminations being connected together to form a second heat-conductive path on the other side of said laminated core, said heat-conductive paths being of gradually increasing cross-section in the direction away from said core, each of said laminations of said first set having one end thereof spaced from the said corresponding end of each of said laminations of said second set, to prevent closed electrically-conductive paths in said component, and a heat sink exposed to a circulating cooling fluid and thermally connected to said first and second heat-conductive paths.

---

**2,770,786**

**DOUBLE SAFETY ELECTRICAL RECEPTACLE**

Mikolaj V. Czyzewski, Seattle, Wash., now by judicial change of name Max Victor Chaiken

Application October 11, 1952, Serial No. 314,383
10 Claims. (Cl. 339—40)

1. A safety electrical receptacle comprising a single receptacle mounting housing having prong openings for the reception of the prongs of a standard electrical plug; electrical contact members disposed in the prong openings; locking members one each for said prong openings separately slidably mounted in said housing having a trigger end portion and a prong opening locking end portion, the underside of which is in longitudinally spaced relation to said contact members, the middle portion of said members being disposed in side by side relation in extending between said prong openings, the trigger portion of each being disposable in a blocking position in a prong opening and the locking end portion simultaneously extending entirely across the oppositely disposed prong opening when said trigger is in blocking position in a prong opening in making it necessary for each prong of a plug to be simultaneously inserted to unlock the prongs opening for the other prong when applied to a receptacle before said prongs may engage the said electrical contact members; and a flat spring for each locking member, each of said springs separately engaging its respective locking member, and each of said springs being fixedly held as to one of its end portions in said housing in urging the trigger member of its engaged locking member normally into blocking position in one prong opening, said locking members moving away from each other against said spring action in being actuated into unblocking position, and simultaneously the locking end portion of said locking member in locking position in the opposite prong opening, and each spring cooperating in mounting its locking member.

---

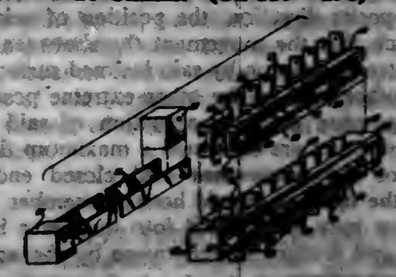
**2,770,787**

**SOCKET MOUNTING BASE FOR TUBE SHIELD**

Arthur C. Peters, Midlothian, Ill., assignor to Cinch Manufacturing Corporation, Chicago, Ill., a corporation of Illinois

Application August 21, 1952, Serial No. 305,684
2 Claims. (Cl. 339—143)

1. A tube socket mounting member and shield support comprising a central ring-like vertical wall portion, said wall portion having a flanged seat portion for receiving and supporting a tube socket, and a plurality of vertical wing members arranged laterally exteriorly of said wall portion, said wing members being disposed in spaced, substantially parallel relation to said wall portion and extending above the same, and provided with frictional engaging means to receive and retain a tube shield, said wing members being connected at their bottom edges thereof to the bottom edge of said wall portion by a resilient U-shaped bight portion, said bight portion lying in a vertical plane.



---

**2,770,788**

**MULTICONTACT ELECTRICAL CONNECTOR**

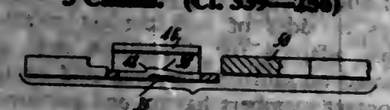
Albert Rechner, Jr., Culver City, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware

Application May 31, 1955, Serial No. 511,889
10 Claims. (Cl. 339—198)

1. An electrical connector comprising, in combination: two pairs of elongated body members of substantially identical cross sectional configuration; means for securing each body member of said pairs in spaced relationship to another of said body members; longitudinally extending ribs on each of said body members, said ribs being disposed in facing spaced relationship in each of said pairs of body members; a plurality of contact members; notches in sides of said contact members, said notches being adapted for disposition over said ribs; spacers disposed on said ribs between said contact members, said contact members having end portions adapted for extension from the space defined between each of said pairs of said body members on at least one side

thereof; contact surfaces on said extended end portions of said contact members, said contact surfaces carried by said contact members carried by each of said pairs of body members being adapted for free interleaved frictional engagement; and pressure applying means disposed longitudinally between a portion of said body member securing means and one end of said plurality of contact members and acting on a line parallel to said ribs, whereby to bias said contact surfaces into tight contact with each other following said interleaving of said contact members.

---



2,770,789
SPRING BINDING POST
Frederick G. Bolte, Nutley, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Delaware
Application January 12, 1953, Serial No. 330,719
2 Claims. (Cl. 339—255)

1. An electrical binding post for engaging a conductor, comprising a body member having an elongated slot, the slot extending linearly along one surface of the body member and the depth of the slot gradually increasing from one end of the body member towards the other end thereof defining an inclined surface, a hollow housing member closed at one end and surrounding said body member, said closed end having an opening whereby a conductor may be inserted therethrough, a cam element slidable in said slot and having a corrugated inclined surface substantially parallel to and adjacent the inclined surface of said slot, means attaching said cam element relatively immovably to said housing member, whereby the cam element and housing member are movable together in a common direction relative to said body member, spring means positioned between said closed end of said housing and said body member and tending to move the body member in one direction and the housing member in the opposite direction, the position of said members being such that the movement therebetween is limited at one extreme position by said inclined surfaces contacting each other, and at the other extreme position of movement, opposing the normal action of said spring, said inclined surfaces are separated a maximum distance, the portion of the space near said closed end being aligned with the opening in said housing member, whereby a conductor may be inserted into the space between said surfaces and wedged therebetween by the action of said spring upon release.

---

2,770,790
CONNECTOR MEMBER WITH SPLIT FLOOR
Hugh W. Batcheller, Newton, Mass., assignor to Kent Mfg. Corp., Newton, Mass., a corporation of Massachusetts
Application January 19, 1954, Serial No. 404,987
3 Claims. (Cl. 339—256)

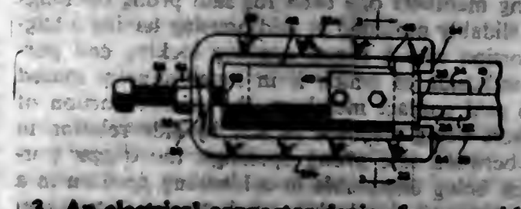
1. A female connector member having a floor, side walls and inturned flanges on said side walls, said floor having a slit extending along its longitudinal median, the ends of the slit being spaced inward from the ends of the floor, said floor having an upstanding boss at the midportion of said slit, said boss having a surface sloping gradually upward to the maximum height in a direction away from the entering end of the member.

---

2,770,791
ELECTRIC CONNECTOR MEMBER WITH OPPOSED BOTTOM FLAPS
Hugh W. Batcheller, Newton, Mass., assignor to Kent Mfg. Corp., Newton, Mass., a corporation of Massachusetts
Application January 28, 1954, Serial No. 406,837
5 Claims. (Cl. 339—258)

1. An electric connector member comprising a piece of sheet metal bent to form a shallow channel with a floor, parallel side walls, and upper flaps projecting from said side walls over said floor toward each other, said flaps sloping slightly downward toward their face ends, and slots in said floor forming lower flaps underlying said upper flaps and sloping slightly upward toward their free ends.

---



2,770,792
ELECTRIC CONNECTOR MEMBER AND METHOD OF MAKING THE SAME
Hugh W. Batcheller, Newton, Mass., assignor to Kent Mfg. Corp., Newton, Mass., a corporation of Massachusetts
Application September 3, 1954, Serial No. 453,980
4 Claims. (Cl. 339—258)

1. An electric connector member of the type comprising a shallow channel with a floor, side walls and overhanging flanges on said walls, said floor having two parallel cuts defining a central band, said band being transversely bent for substantially its entire length.

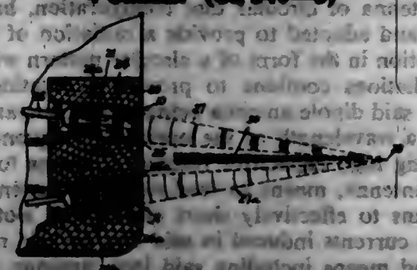
---

2,770,793
ANODE CONNECTOR FOR ELECTROPLATING LINES
John E. Erhardt, Jr., and Albert E. Grimes, Baltimore, Md., assignors to Crown Cork & Seal Company, Inc., a corporation of New York
Application October 3, 1951, Serial No. 249,512
4 Claims. (Cl. 339—272)

3. An electrical connector device for use with an electroplating anode positioned within an electroplating tank and being provided with a vertically extending tongue for engagement by the connector device, the connector device comprising an elongated member having a first end for abutting a first face of the anode vertical tongue and a second end adapted to extend through a slot in

the side of the electroplating tank in which the anode is positioned, means on the second end of the elongated member for receiving a flexible electrical conductor, a yoke element for overlying the elongated member, the yoke element having parallel side arms each provided with a hook portion for engaging a second face of the vertical anode tongue opposite the first tongue face, the yoke element being further provided with a cross-arm, means comprising screw threaded means arranged to act between the cross-arm of the yoke element and the second end of the elongated member for tending to move said yoke element and elongated member with respect to each other, the arrangement being such that operation of the screw thread means will firmly clamp the anode tongue between the first end of the elongated member and the hook portions of the parallel yoke arms.

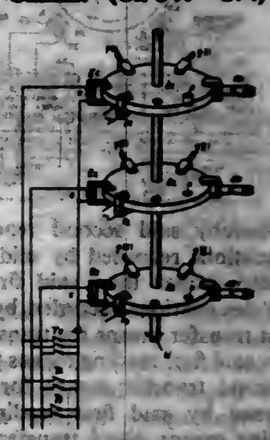
---



2,770,794
ELECTRICAL CONNECTING DEVICE
Erich Hofmann, Duesseldorf, Germany
Application December 1, 1949, Serial No. 130,449
Claims priority, application Switzerland March 30, 1949
5 Claims. (Cl. 339—273)

1. A clamping connection device adapted to be interposed between the ends of two electric conductors to be interconnected, comprising a metal socket formed of a shell having the shape of a truncated cone provided with an outer insulating material casing, an integral clamping element having a peripheral surface of revolution having a diameter larger than the smallest internal diameter of said cone at the apex of said cone and smaller than the largest internal diameter thereof, of said cone, said clamping element being disposed within said socket adjacent the smaller end thereof of said socket and adapted to directly contact and squeeze one of said conductor ends against the inner conical wall of said socket, so as to establish direct electric contact therebetween, elastic resilient means located within the socket and adapted to urge said clamping element toward the smaller end of said cone into its squeezing position to provide firm direct contact between the conductor and the conical wall surface irrespective of the smallness of the conductor diameter, and conductive means formed integrally with said socket and adapted for contact with a second electric conductor, so that there is provided between said electric contacts an integral uninterrupted metallic electric path.

---

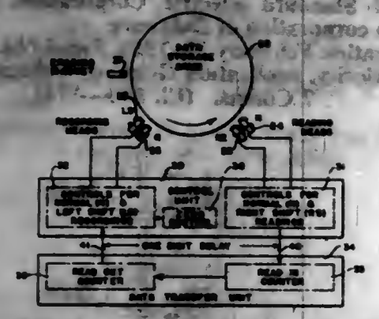


2,770,795
ACOUSTIC LOG
Robert E. Peterson, Old Lyme, Conn., assignor to Raytheon Manufacturing Company, Newton, Mass., a corporation of Delaware
Application March 30, 1951, Serial No. 218,463
4 Claims. (Cl. 340—3)

1. A speed-measuring device comprising means for generating compressional wave energy, means for transmitting said energy through a fluid in a converging beam to produce cavitation in the region of convergence, means for receiving the energy waves reflected from said region of cavitation, and means for comparing the frequency of said transmitted waves with the frequency of said reflected waves.

---

2,770,796
REGISTERING DEVICE FOR RECEIVING AND SENDING CONNECTING ORDERS, PARTICULARLY FOR CONVEYING PLANTS
Hans Bilz, Berlin-Steglitz, Germany, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application February 13, 1953, Serial No. 336,851
Claims priority, application Germany February 23, 1952
7 Claims. (Cl. 340—174)

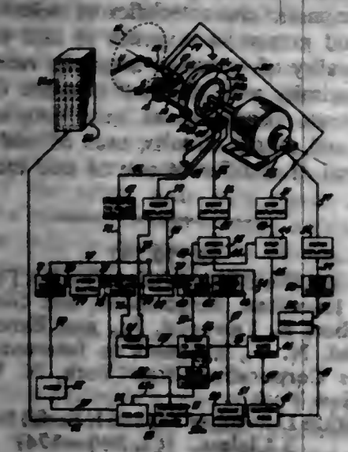


1. A register comprising a plurality of input circuits, means for energizing said input circuits in different code combinations, a plurality of output circuits, a plurality of movable carrier means, a plurality of groups of magnetic register elements, each of said groups mounted on a different one of said carrier means, each element of a group spaced from the other, single means coupling said carrier means for movement in tandem, a plurality of magnetic recording devices, each coupled to a different one of said input circuits and adapted to be controlled thereby, fixedly mounted with respect to and in proximity of a first portion of a different one of said carrier means, said recording devices adapted to selectively alter the magnetic characteristics of selected of the elements in said groups in response to said code combinations, a plurality of movable, magnetic receiving devices, each in proximity with different portions of said carrier means, separate switch means, each coupled to a different one of said output circuits, each of said switch means under control of a different one of said magnetic receiving devices.

---

2,770,797
DATA STORAGE APPARATUS
Francis E. Hamilton, Binghamton, and George V. Hawkins, Robert E. Lawhead, Jr., and Ernest S. Hughes, Jr., Vestal, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 31, 1951, Serial No. 264,304
3 Claims. (Cl. 340—174)

1. A data storage apparatus comprising a rotatable storage member having a magnetizable periphery, a first magnetic recording means cooperating with said storage member for recording a sequence of data designations in consecutive circumferential relationship on the periphery of said member as said member is rotated, a second magnetic recording means cooperating with said storage member for recording a sequence of data designations in consecutive circumferential relationship on the periphery of said member as said member is rotated, a first magnetic



reading means adapted to cooperate with the periphery of said storage member and positioned in circumferentially spaced relationship to said first magnetic recording means for reading the data designations recorded thereby, a second magnetic reading means adapted to cooperate with the periphery of said storage member and positioned in circumferentially spaced relationship to said second recording means for reading the data designations recorded thereby, the circumferential distance separating said second reading means from said second recording means being substantially less than the circumferential distance separating said first reading means from said first record-

ing means, whereby said second reading means reads the data designations recorded by said second recording means relatively sooner than said first reading means reads the data designations recorded by said first recording means, first transfer means for transferring data designations read by said first reading means to said first recording means, second transfer means for transferring data designations read by said first reading means to said second recording means, third transfer means for transferring data designations read by said second reading means to said first recording means, and control means for rendering said first, second and third transfer means effective selectively.

**2,770,798**
**METHODS AND APPARATUS FOR MEASURING ANGULAR MOVEMENT**
Robert L. Roth, Mount Pleasant, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application November 24, 1953, Serial No. 393,976
18 Claims. (Cl. 340—266)

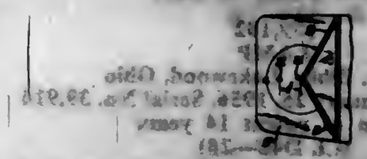
1. Apparatus for measuring the angular movement of a shaft from a zero position comprising signal generating means, means operating synchronously with said signal generating means for generating first, second, third and fourth pulses, said first and second pulses being separated by a time interval indicative of the angular movement of said shaft, counting means, gating means for selectively coupling said signal generating means to said counting means, said gating means normally being opened by said first pulse and closed by said second pulse, control means conditioned by the reception of a predetermined number of said first and second pulses and a subsequent one of said fourth pulses to be responsive to one of said third pulses for obtaining information from said counting means, and resetting means conditioned by the operation of said control means to be responsive to another of said fourth pulses for resetting said counting means.

---

**2,770,799**
**EMERGENCY DIAPHRAGM FOR AIR BRAKES AND THE LIKE**
Charles H. Hess, Downey, Calif.
Application July 24, 1953, Serial No. 370,185
6 Claims. (Cl. 340—242)

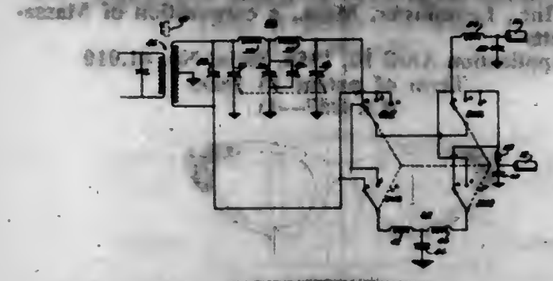
1. In a fluid pressure actuated system for brakes or the like wherein force is exerted through a flexible diaphragm, an auxiliary diaphragm adjacent the first diaphragm arranged to entrap fluid under pressure upon failure of the first diaphragm.

---



**2,770,800**
**ANTENNAS**
Frank J. Landberg, East Orange, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland
Application June 2, 1951, Serial No. 229,629
16 Claims. (Cl. 343—787)

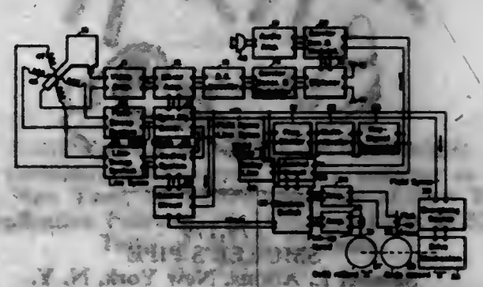
1. An antenna system comprising a dipole antenna adapted to be rotated to provide a radiation of horizontal polarization in the form of a figure-of-eight pattern, a loop antenna of circular disc configuration, having slots therein and adapted to provide a radiation of horizontal polarization in the form of a circular pattern whereby the two radiations combine to provide a rotating cardioid pattern, said dipole antenna being small compared to one-half of a wavelength of the operating frequency thereby presenting high capacitive reactance, means to feed said dipole antenna, means to feed said loop antenna including means to effectively short circuit said slots with respect to currents induced in said disc by said rotating dipole, and means including said loop antenna to provide a resonant loading to compensate for the capacitance reactance of said dipole antenna.



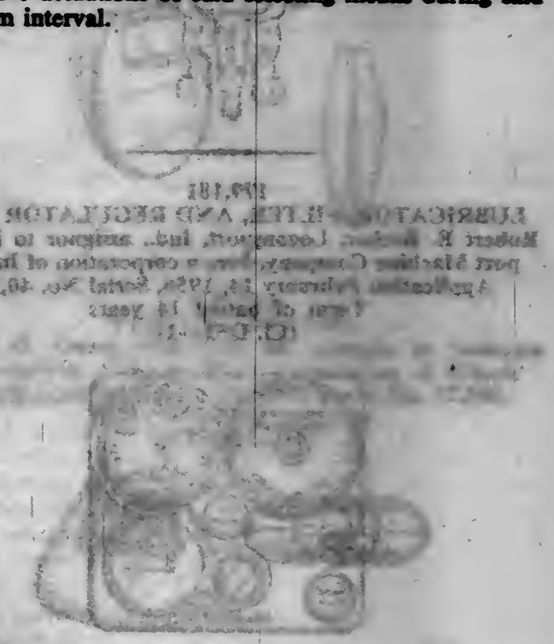
**2,770,801**
**CORNER REFLECTOR TYPE ANTENNA**
Ernest A. Jones, Columbus, Ohio, assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application July 23, 1952, Serial No. 300,414
9 Claims. (Cl. 343—834)

1. An antenna assembly for an airplane having a fuselage and a pair of wings, comprising: an antenna for each wing including a pair of plates arranged to extend outwardly from the end of the wing and form continuations of the upper and lower sides thereof, a pair of reflectors disposed between said plates and disposed in planes extending inwardly from a line of intersection transverse to said plates and at substantially equal angles from a plane transverse to the fuselage, and an antenna element disposed between said plates and in said transverse plane in outwardly spaced parallel relation to said line of intersection.

---



**2,770,802**
**RADIO ANTENNA SYSTEM**
John H. Mullaney, Washington, D. C., assignor to Direct Company, Washington, D. C., a partnership
Application November 13, 1951, Serial No. 256,568
6 Claims. (Cl. 343—852)

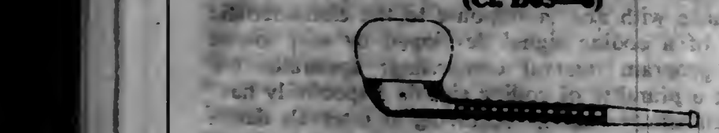


1. In a radio wave receiving system, in combination, a single pair of receiving antennas spaced from one another in a horizontal direction, means comprising respective channels for deriving signals from said antennas over said respective channels, means for combining the derived signals for application to receiving equipment, means for individually matching the impedances of the antennas to said combining means, and an M-derived phase shifting circuit in one of said channels for continuously adjusting the relative phase relationship of the combined signals through a range of the order of at least 180 degrees of phase relationship, while maintaining the effective output impedance of said phase shifting circuit substantially constant, whereby to vary the resultant directional pattern of sensitivity of said antennas and thereby to discriminate against undesired signals.

---

**2,770,803**
**SUBSCRIPTION TELEVISION SYSTEM**
Alexander Eliot, River Forest, Ill., assignor to Zenith Radio Corporation, a corporation of Illinois
Application October 31, 1951, Serial No. 254,099
6 Claims. (Cl. 178—5.1)

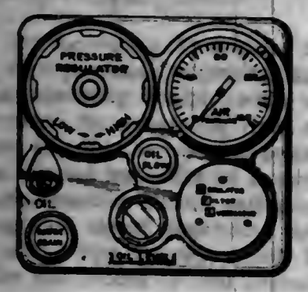
5. A coding-signal source for controlling a coding device to effect mode changes in a subscription system in accordance with and in response to the characteristic variations of a coding signal developed by said source during a program interval comprising: apparatus for developing a plurality of coding signals respectively having characteristic variations occurring at intervals determined by different prescribed coding schedules; selecting means coupled to said apparatus for selectively applying said coding signals to said coding device; means for developing a key signal representing a random selecting schedule; and a control circuit coupled to said key-signal developing means and operable responsive to said key signal at spaced intervals long with respect to the aforesaid intervals determined by the coding schedules of said plurality of coding signals but short with respect to said program interval for actuating said selecting means at corresponding spaced intervals in accordance with said selecting schedule to determine the selective application of said plurality of coding signals to said coding device whereby a plurality of mode changes are effected between successive actuations of said selecting means during said program interval.



# DESIGNS

## NOVEMBER 13, 1956

179,178
**LIQUID DISPENSER FOR SURFACE TREATING MACHINES**
Carl Eric Stefan Andersson-Sasse, Solna, Sweden, assignor to Aktiebolaget Ekbalvalar, Stockholm, Sweden, a corporation of Sweden
Application September 26, 1954, Serial No. 32,344
Claims priority, application Sweden April 27, 1954
Term of patent 14 years
(Cl. D9—2)

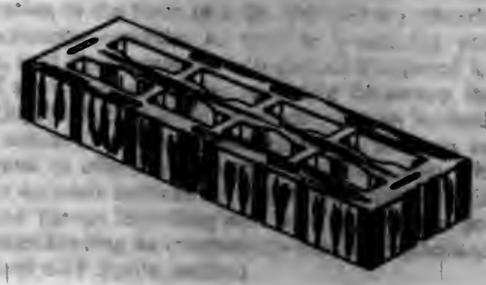


179,179
**SMOKER'S PIPE**
Samuel L. Atkins, New York, N. Y.
Application March 26, 1956, Serial No. 40,763
Term of patent 14 years
(Cl. D35—5)

179,180
**ANIMAL FIGURE FOR A HOBBY-HORSE OR SIMILAR ARTICLE**
Allan Levi Beck, North Hollywood, Calif.
Application June 28, 1955, Serial No. 36,742
Term of patent 14 years
(Cl. D34—15)

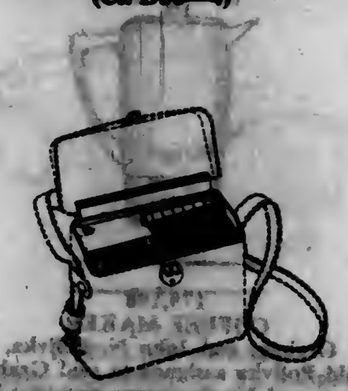
179,181
**LUBRICATOR, FILTER, AND REGULATOR UNIT**
Robert E. Becker, Logansport, Ind., assignor to Logansport Machine Company, Inc., a corporation of Indiana
Application February 14, 1956, Serial No. 40,162
Term of patent 14 years
(Cl. D52—1)

179,182
**LAMP**
John D. Bibbs, Lakewood, Ohio
Application January 25, 1956, Serial No. 39,914
Term of patent 14 years
(Cl. D48—20)

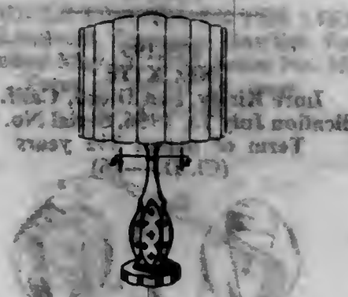


179,183
**SUNGLASS FRAME FRONT OR THE LIKE**
Jack Bloch, Leominster, Mass., assignor to Foster Grant Co., Inc., Leominster, Mass., a corporation of Massachusetts
Application April 16, 1956, Serial No. 41,010
Term of patent 14 years
(Cl. D57—1)

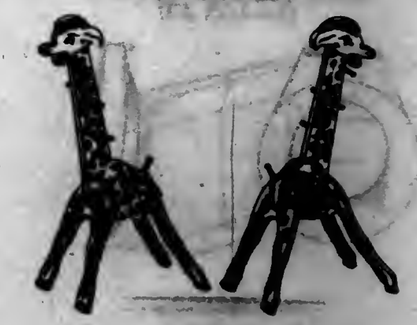
179,184
**SUNGLASS FRAME FRONT OR THE LIKE**
Jack Bloch, Leominster, Mass., assignor to Foster Grant Co., Inc., Leominster, Mass., a corporation of Massachusetts
Application April 16, 1956, Serial No. 41,014
Term of patent 14 years
(Cl. D57—1)



179,185
**BUILDING BLOCK**
Martin Brenham, Pound, Va.
Application May 11, 1956, Serial No. 41,451
Term of patent 14 years
(Cl. D18—2)

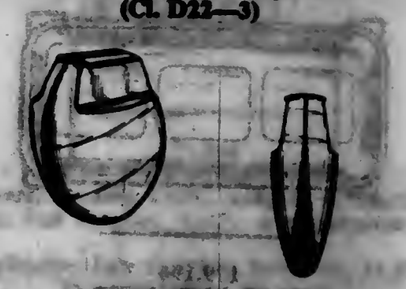


179,186
**PORTABLE RADIO RECEIVER**
Jack Bobbit and Carl W. Clarke, Chicago, Ill., assignors to Revere Camera Company, Chicago, Ill., a corporation of Delaware
Application March 26, 1954, Serial No. 29,696
Term of patent 3½ years
(Cl. D86—4)



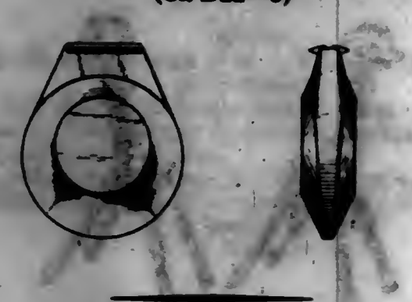
179,187
**ELECTRIC LAMP**
Charles W. Clemens, Nashville, Tenn., assignor to Aladdin Industries, Incorporated, Nashville, Tenn., a corporation of Illinois
Application August 16, 1955, Serial No. 37,549
Term of patent 3½ years
(Cl. D48—20)

179,188
**PLASTIC DOILY**
William R. Cole, London, England
Application July 5, 1956, Serial No. 42,152
Term of patent 14 years
(Cl. D39—2)



179,189
**COSTUMER**
Wilbert F. Comstock, Union City, Pa.
Application April 29, 1955, Serial No. 35,736
Term of patent 7 years
(Cl. D33—6)

179,190
**CASING FOR BEVERAGE DISPENSER**
Harry Cornman, Scarborough, N. Y., assignor to Apco, Inc., New York, N. Y., a corporation of New York
Application February 27, 1956, Serial No. 40,326
Term of patent 14 years
(Cl. D52—3)



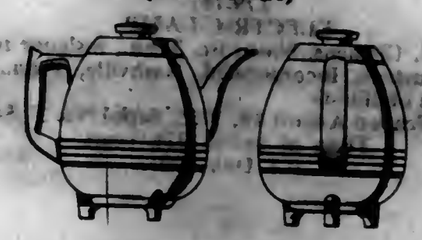
179,191
**ELECTRIC SHAVER**
Robert O. Ernest, Oak Park, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Application September 13, 1955, Serial No. 37,905
Term of patent 14 years
(Cl. D22—3)

179,192
**ELECTRIC SHAVER**
Robert O. Ernest, Oak Park, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Application September 13, 1955, Serial No. 37,906
Term of patent 14 years
(Cl. D22—3)

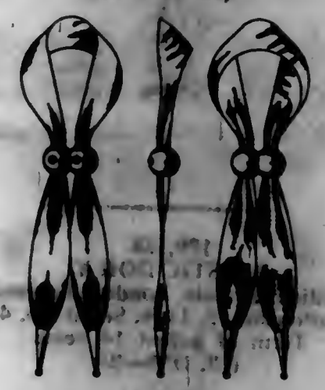
179,193
**ELECTRIC SHAVER**
Robert O. Ernest, Oak Park, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Application September 13, 1955, Serial No. 37,969
Term of patent 14 years
(Cl. D22—3)

179,194
**ATOMIZER**
Karl Flury, Adliswil, Zurich, Switzerland, assignor to Deforest Aktiengesellschaft, Zurich, Switzerland, a corporation of Switzerland
Application September 9, 1955, Serial No. 37,866
Claims priority, application Switzerland April 4, 1955
Term of patent 7 years
(Cl. D83—1)

179,195
**TOTE BOX**
Roger E. French and Nicholas W. Keller, New Kensington, Pa., assignors to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania
Application March 22, 1955, Serial No. 35,156
Term of patent 14 years
(Cl. D56—12)



179,196
**TAPE DISPENSER**
Irvin J. Gershon, Springfield, N. J., assignor to Permacel Tape Corporation, a corporation of New Jersey
Application November 4, 1955, Serial No. 38,729
Term of patent 14 years
(Cl. D74—1)

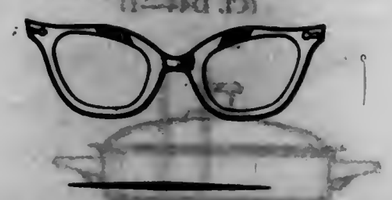


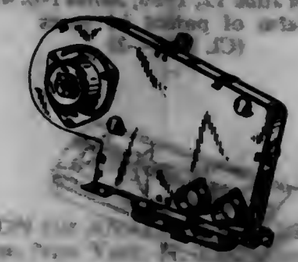
179,197
**COFFEE MAKER OR SIMILAR ARTICLE**
Bernard A. Graham, Hinsdale, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Application June 24, 1955, Serial No. 36,652
Term of patent 14 years
(Cl. D44—26)

179,198
**COFFEE MAKER**
Maurice H. Graham and John N. Pellvin, Minneapolis, Minn.; said Pellvin assignor to said Graham, Maurice W. Graham, and Northwestern National Bank of Minneapolis, all of Hennepin County, Minn., executors of said Maurice H. Graham, deceased
Application February 9, 1954, Serial No. 28,932
Term of patent 14 years
(Cl. D44—26)

179,199
**NECKTIE**
Imre Kiraly, San Diego, Calif.
Application July 13, 1956, Serial No. 42,248
Term of patent 3½ years
(Cl. D3—16)

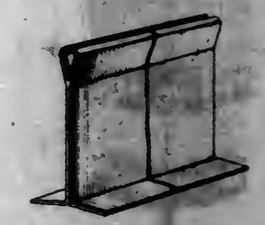
179,200
**PANTY**
Mary L. Klym, Detroit, Mich.
Application June 7, 1956, Serial No. 41,807
Term of patent 14 years
(Cl. D3—17)





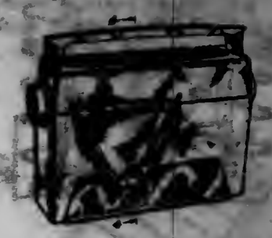
179,201
**EYEGLASS FRAME**
Alexander Kono, Woodside, N. Y., assignor to Kono Manufacturing Co. Inc., Woodside, N. Y., a corporation of New York
Application March 30, 1956, Serial No. 40,851
Term of patent 14 years
(Cl. D57—1)

179,202
**EYEGLASS FRAME**
Alexander Kono, Woodside, N. Y., assignor to Kono Manufacturing Co. Inc., Woodside, N. Y., a corporation of New York
Application April 10, 1956, Serial No. 40,594
Term of patent 14 years
(Cl. D57—1)



179,203
**VEHICLE HEATER OR THE LIKE**
Alan S. Lansburn, Trenance, Dawlish, England
Application May 13, 1955, Serial No. 35,982
Term of patent 14 years
(Cl. D14—6)

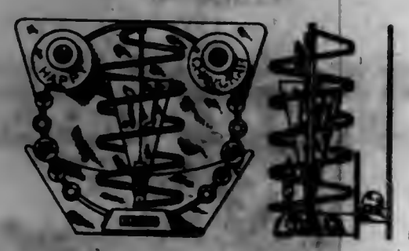
179,204
**SEPARATOR FOR MEAT AND PRODUCE**
Nels D. Levis, Los Angeles, Calif., assignor to Ekco Products Company, Chicago, Ill., a corporation of Illinois
Application March 12, 1956, Serial No. 40,554
Term of patent 14 years
(Cl. D11—1)



179,205
**SEPARATOR FOR MEAT AND PRODUCE**
Nels D. Levis, Los Angeles, Calif., assignor to Ekco Products Company, Chicago, Ill., a corporation of Illinois
Application March 12, 1956, Serial No. 40,556
Term of patent 14 years
(Cl. D11—1)

179,206
**VIAL OR SIMILAR ARTICLE**
Edwin W. Lynn, Irvington, N. J., assignor to Colloplastic Corporation, a corporation of New Jersey
Application April 8, 1955, Serial No. 35,420
Term of patent 14 years
(Cl. D58—26)

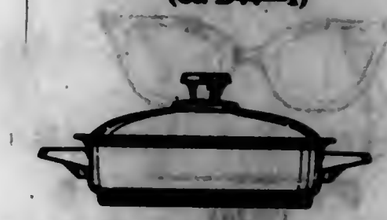
179,207
**PORTABLE RADIO CABINET**
John W. Mason, Detroit, Mich.
Application April 4, 1956, Serial No. 40,893
Term of patent 14 years
(Cl. D56—4)



179,208
**BOTTLE**
Regis Meyers, Arcadia, Calif., assignor to Sunkist Growers, Inc., Los Angeles, Calif., a corporation of California
Application July 23, 1954, Serial No. 31,573
Term of patent 14 years
(Cl. D58—8)

179,209
**DISPLAY STAND**
John D. Miller, Clifton, N. J.
Application January 12, 1956, Serial No. 39,606
Term of patent 14 years
(Cl. D60—10)

179,210
**DREIDEL ORNAMENT**
Sara Rae Nalmon, Milwaukee, Wis.
Application February 14, 1956, Serial No. 40,174
Term of patent 14 years
(Cl. D29—1)

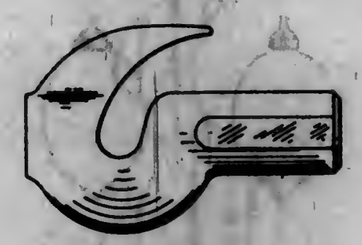


179,211
**CHANUKAH DISPLAY ORNAMENT**
Sara Rae Nalmon, Milwaukee, Wis.
Application February 27, 1956, Serial No. 40,344
Term of patent 14 years
(Cl. D29—1)

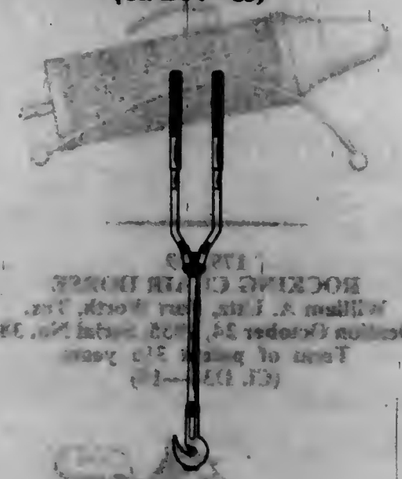
179,212
**MENORAH**
Sara Rae Nalmon, Milwaukee, Wis.
Application March 12, 1956, Serial No. 40,567
Term of patent 14 years
(Cl. D29—1)

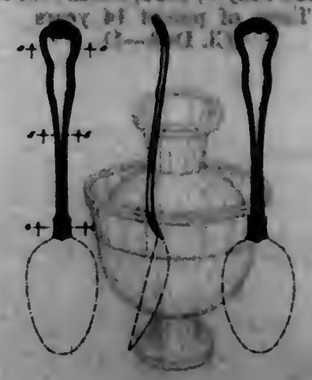
179,213
**COOKING PAN OR SIMILAR ARTICLE**
David L. Palmer, Evanston, Ill., assignor, by mesne assignments, to Reno-Ware Distributors Inc., Opportunity, Wash., a corporation of Washington
Application April 25, 1955, Serial No. 35,661
Term of patent 14 years
(Cl. D44—1)

179,214
**MOLDED FOOD PRODUCT**
Leo Peters, Grand Rapids, Mich.
Application June 12, 1956, Serial No. 41,880
Term of patent 14 years
(Cl. D62—2)



179,215
**INFANT'S FEEDING NIPPLE**
Joseph Prinzmetal, Los Angeles, Calif.
Application March 19, 1956, Serial No. 40,652
Term of patent 14 years
(Cl. D63—1)





179,216
**CABLE CUTTER HEAD**
Leslie A. Repscher and William C. Stratman, Los Angeles, Calif., assignors to North American Aviation, Inc.
Application April 2, 1956, Serial No. 40,872
Term of patent 14 years
(Cl. D54—13)

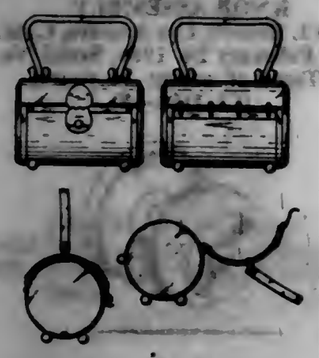
179,217
**CABLE CUTTER**
Leslie A. Repscher and William C. Stratman, Los Angeles, Calif., assignors to North American Aviation, Inc.
Application April 2, 1956, Serial No. 40,875
Term of patent 14 years
(Cl. D54—13)

179,218
**SPOON OR ANALOGOUS ARTICLE**
Oscar Riedemer, New York, N. Y., assignor to Tiffany & Company, a corporation of New York
Application May 7, 1956, Serial No. 41,393
Term of patent 14 years
(Cl. D54—12)

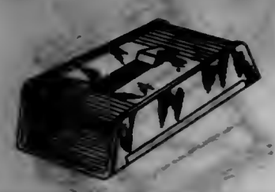
179,219
**PLASTIC FLY SWATTER**
Robert H. Rodgers, Cleveland Heights, Ohio, assignor to Industrial Plastics, Inc., Cleveland, Ohio, a corporation of Ohio
Application May 29, 1956, Serial No. 41,699
Term of patent 14 years
(Cl. D31—3)

179,220
**KNOB ASSEMBLY**
Fred J. Russell, Los Angeles, Calif.
Application February 24, 1956, Serial No. 40,316
Term of patent 14 years
(Cl. D10—8)

179,221
**AWNING**
Peter M. Scatton, Philadelphia, Pa., assignor to Scatton Bros. Mfg. Co., Philadelphia, Pa., a partnership consisting of Michael J. Scatton, Peter M. Scatton, John P. Scatton, and Christina M. Scatton
Application April 24, 1956, Serial No. 41,187
Term of patent 14 years
(Cl. D21—6)

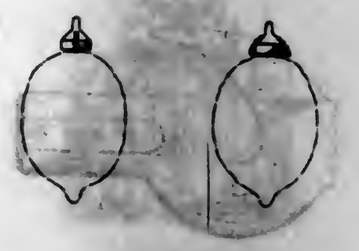


179,222
**LOCOMOTIVE BODY OR THE LIKE**
Carl F. Schmo, Hagaman, N. Y., and John K. Ryan, Erie, Pa., assignors to General Electric Company, a corporation of New York
Application February 16, 1955, Serial No. 34,448
Term of patent 14 years
(Cl. D66—1)



179,223
**COMBINED SCISSORS, SCABBARD, AND LETTER OPENER**
John J. Schwartz, St. Paul, Minn., assignor to Brown & Bigelow, St. Paul, Minn.
Application December 2, 1955, Serial No. 39,140
Term of patent 14 years
(Cl. D74—1)

179,224
**HANDBAG**
Harry T. Silverman, Forest Hills, N. Y.
Application July 19, 1956, Serial No. 42,292
Term of patent 7 years
(Cl. D87—3)



179,225
**RAZOR BLADE DISPENSER**
Stanley L. Smith, Stamford, Conn., assignor to Bic Strike Blade Company, New York, N. Y., a corporation of New York
Application February 3, 1956, Serial No. 40,035
Term of patent 14 years
(Cl. D58—12)

179,226
**COOKIE JAR**
Walter D. Starnes, Los Angeles, Calif., assignor to Walter Starnes, Inc., Los Angeles, Calif., a corporation of California
Application January 9, 1956, Serial No. 39,676
Term of patent 3½ years
(Cl. D58—25)

179,227
**COMBINED BOTTLE AND CLOSURE CAP**
Bernard George Middleton, England
Application October 18, 1955, Serial No. 38,318
Claims priority, application Great Britain October 4, 1955
Term of patent 14 years
(Cl. D68—26)

179,228
**HOLDER FOR DRINK DISPENSING VESSEL**
George R. Thomson, Kirkwood, Mo.
Application October 3, 1955, Serial No. 38,212
Term of patent 3½ years
(Cl. D2—3)

179,229
**ROCKING CHAIR HORSE**
William A. Utz, Fort Worth, Tex.
Application October 24, 1955, Serial No. 38,544
Term of patent 3½ years
(Cl. D34—15)

179,230
**MOLD FOR CONFECTION**
Geraldine D. Williamson, Anderson, Ind.
Application May 9, 1955, Serial No. 35,090
Term of patent 14 years
(Cl. D44—1)

179,231
**PAVING TILE**
Marco Zanuso and Alberto Scarzella, Milan, Italy
Application January 3, 1955, Serial No. 33,785
Term of patent 7 years
(Cl. D18—2)

179,232
**PENHOLDER**
Alvin M. Ziegler and Joseph Jeremias, Bronx, N. Y.
Application July 16, 1956, Serial No. 42,258
Term of patent 14 years
(Cl. D74—1)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 13TH DAY OF NOVEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

G. M. B. Corp.: *See*—
Greer, Edward M., and Mercier. Re. 24,238.

Greer, Edward M., and J. Mercier, to G. M. B. Corp. Power operated hatch cover. Re. 24,238, 11-13-56, Cl. 160—188.

Mercier, Jean: *See*—
Greer, Edward M., and Mercier. Re. 24,238.

Sjoboen, George W., to Steel Door Corp. Overhead door structure. Re. 24,237, 11-13-56, Cl. 20—19.

Steel Door Corp.: *See*—
Sjoboen, George W. Re. 24,237.

# LIST OF PLANT PATENTEES

Motose, Thomas H. Rose plant. 1,527, 11-13-56, Cl. 47—61.

# LIST OF DESIGN PATENTEES

Aktiebolaget Elektrolux: *See*—
Anderson-Sasen, Carl H. S. 179,178.

Aladdin Industries, Inc.: *See*—
Clemens, Charles W. 179,187.

Aluminum Co. of America: *See*—
French, Roger E., and Keller. 179,195.

Anderson-Sasen, Carl H. S., to Aktiebolaget Elektrolux. Liquid dispenser for surface treating machines. 179,178, 11-13-56, Cl. D9—2.

Apco, Inc.: *See*—
Cormano, Harry. 179,190.

Atkins, Samuel L. Smoker's pipe. 179,179, 11-13-56, Cl. D35—8.

Beck, Allen L. Animal figure for a hobby-horse or similar article. 179,180, 11-13-56, Cl. D34—15.

Becker, Robert E., to Logansport Machine Co., Inc. Lubricator, filter and regulator unit. 179,181, 11-13-56, Cl. D52—1.

Bibbs, John D. Lamp. 179,182, 11-13-56, Cl. D48—20.

Bloch, Jack, to Foster Grant Co., Inc. Sunglass frame front or the like. 179,183, 11-13-56, Cl. D57—1.

Bloch, Jack, to Foster Grant Co., Inc. Sunglass frame front or the like. 179,184, 11-13-56, Cl. D57—1.

Bla Strike Blade Co.: *See*—
Smith, Stanley L. 179,225.

Branham, Martin. Building block. 179,185, 11-13-56, Cl. D18—2.

Briskin, Jack, and C. W. Claras, to Revere Camera Co. Portable radio reciver. 179,186, 11-13-56, Cl. D56—4.

Brown & Bigelow: *See*—
Schwartz, John J. 179,223.

Celluplastic Corp.: *See*—
Lynn, Edwin W. 179,206.

Claras, Carl W.: *See*—
Briskin, Jack, and Claras. 179,186.

Clemens, Charles W., to Aladdin Industries, Inc. Electric lamp. 179,187, 11-13-56, Cl. D48—20.

Cole, William H. Plastic dolly. 179,188, 11-13-56, Cl. D9—2.

Comstock, Wilbert F. Costumer. 179,189, 11-13-56, Cl. D32—6.

Cormano, Harry, to Apco, Inc. Casing for beverage dispenser. 179,190, 11-13-56, Cl. D52—3.

Defensor Aktiengesellschaft: *See*—
Flury, Karl. 179,194.

Elco Products Co.: *See*—
Levie, Nola D. 179,204.
Levie, Nola D. 179,205.

Ernest, Robert O., to Sunbeam Corp. Electric shaver. 179,191, 11-13-56, Cl. D22—3.

Ernest, Robert O., to Sunbeam Corp. Electric shaver. 179,192, 11-13-56, Cl. D22—3.

Ernest, Robert O., to Sunbeam Corp. Electric shaver. 179,193, 11-13-56, Cl. D22—3.

Erner, John K.: *See*—
Schaus, Carl F., and Erner. 179,222.

Flury, Karl, to Defensor Aktiengesellschaft. Atomiser. 179,194, 11-13-56, Cl. D52—1.

Foster Grant Co., Inc.: *See*—
Bloch, Jack. 179,183.
Bloch, Jack. 179,184.

French, Roger E., and N. W. Keller, to Aluminum Co. of America. Tote box. 179,195, 11-13-56, Cl. D58—12.

General Electric Co.: *See*—
Schaus, Carl F., and Erner. 179,222.

Gershen, Irvin J., to Permacel Tape Corp. Tape dispenser. 179,196, 11-13-56, Cl. D74—1.

Graham, Bernard A., to Sunbeam Corp. Coffee maker or similar article. 179,197, 11-13-56, Cl. D44—26.

Graham, Maurice H., and J. N. Polivka; said Polivka assor. to said Graham, M. W. Graham, and Northwestern National Bank of Minneapolis, executors of said M. H. Graham, deceased. Coffee maker. 179,198, 11-13-56, Cl. D44—26.

Graham, Maurice W.: *See*—
Graham, Maurice H., and Polivka. 179,198.

Industrial Plastics, Inc.: *See*—
Rodgers, Robert H. 179,219.

Jeremias, Joseph: *See*—
Ziegler, Alvin M., and Jeremias. 179,232.

Keller, Nicholas W.: *See*—
French, Roger E., and Keller. 179,195.

Kiraly, Imre. Necktie. 179,199, 11-13-56, Cl. D3—16.

Klym, Mary L. Panty. 179,200, 11-13-56, Cl. D8—17.

Kono, Alexander, to Kono Mfg. Co. Inc. Eyeglass frame. 179,201, 11-13-56, Cl. D57—1.

Kono, Alexander, to Kono Mfg. Co. Inc. Eyeglass frame. 179,202, 11-13-56, Cl. D57—1.

Kono Mfg. Co. Inc.: *See*—
Kono, Alexander. 179,201.
Kono, Alexander. 179,202.

Lamburn, Alan S. Vehicle heater or the like. 179,203, 11-13-56, Cl. D14—6.

Levie, Nola D., to Elco Products Co. Separator for meat and produce. 179,204, 11-13-56, Cl. D11—1.

Levie, Nola D., to Elco Products Co. Separator for meat and produce. 179,205, 11-13-56, Cl. D11—1.

Logansport Machine Co., Inc.: *See*—
Becker, Robert E. 179,181.

Lynn, Edwin W., to Celluplastic Corp. Vial or similar article. 179,206, 11-13-56, Cl. D58—26.

Mason, John W. Portable radio cabinet. 179,207, 11-13-56, Cl. D56—4.

Meyers, Regis, to Sunkist Growers, Inc. Bottle. 179,208, 11-13-56, Cl. D60—8.

Miller, John D. Display stand. 179,209, 11-13-56, Cl. D20—19.

Nalmon, Sara R. Dredel ornament. 179,210, 11-13-56, Cl. D29—1.

Nalmon, Sara R. Chanukah display ornament. 179,211, 11-13-56, Cl. D29—1.

Nalmon, Sara R. Menorah. 179,212, 11-13-56, Cl. D29—1.

North American Aviation, Inc.: *See*—
Repscher, Leslie A., and Stratman. 179,216.
Repscher, Leslie A., and Stratman. 179,217.

Northwestern National Bank of Minneapolis: *See*—
Graham, Maurice H., and Polivka. 179,198.

Painter, David L., to Rena-Ware Distributors Inc. Cooking pan or similar article. 179,213, 11-13-56, Cl. D44—1.

Permacel Tape Corp.: *See*—
Gershen, Irvin J. 179,196.

Peters, Leo. Molded food product. 179,214, 11-13-56, Cl. D62—2.

Polivka, John N.: *See*—
Graham, Maurice H., and Polivka. 179,198.

Priamment, Joseph. Infant's feeding nipple. 179,215, 11-13-56, Cl. D32—1.

Rena-Ware Distributors Inc.: *See*—
Painter, David L. 179,213.

Repscher, Leslie A., and W. C. Stratman, to North American Aviation, Inc. Cable cutter head. 179,216, 11-13-56, Cl. D54—13.

Repscher, Leslie A., and W. C. Stratman, to North American Aviation, Inc. Cable cutter. 179,217, 11-13-56, Cl. D54—13.

Revere Camera Co.: *See*—
Briskin, Jack, and Claras. 179,186.

Riedener, Oscar, to Tiffany & Co. Spoon or analogous article. 179,218, 11-13-56, Cl. D54—12.

Rodgers, Robert H., to Industrial Plastics, Inc. Plastic fly swatter. 179,219, 11-13-56, Cl. D81—3.

## LIST OF DESIGN PATENTEES

Russell, Fred J. Knob assembly. 179,220, 11–13–56, Cl. D10—8.
Scarsella, Alberto: *See*—
Zanuso, Marco, and Scarsella. 179,231.
Scatton Bros. Mfg. Co.: *See*—
Scatton, Peter M. 179,221.
Scatton, Peter M., to Scatton Bros. Mfg. Co. Awning. 179,231, 11–13–56, Cl. D21—6.
Schaus, Carl F., and J. K. Esser, to General Electric Co. Locomotive body or the like. 179,222, 11–13–56, Cl. D58—1.
Schwartz, John J., to Brown & Bigelow. Combined scissors, scabbard, and letter opener. 179,223, 11–13–56, Cl. D74—1.
Silverman, Harry T. Handbag. 179,224, 11–13–56, Cl. D67—3.
Smith, Stanley L., to Bia Strike Blade Co. Razor blade dispenser. 179,227, 11–13–56, Cl. D36—12.
Starnes, Walter D., to Walter Starnes, Inc. Cookie jar. 179,226, 11–13–56, Cl. D58—25.
Starnes, Walter, Inc.: *See*—
Starnes, Walter D. 179,226.
Stratman, William C.: *See*—
Repecher, Leslie A., and Stratman. 179,216.
Repecher, Leslie A., and Stratman. 179,217.
Strong, Bernard. Combined bottle and closure cap. 179,227, 11–13–56, Cl. D58—26.
Sunbeam Corp.: *See*—
Ernest, Robert O. 179,191.
Ernest, Robert O. 179,192.
Ernest, Robert O. 179,193.
Graham, Bernard A. 179,197.
Sunkist Growers, Inc.: *See*—
Meyers, Regis. 179,208.
Thomsen, George R. Holder for drink dispensing vessel. 179,228, 11–13–56, Cl. D2—3.
Tiffany & Co.: *See*—
Riedner, Oscar. 179,218.
Uttz, William A. Rocking chair horse. 179,229, 11–13–56, Cl. D34—15.
Williamson, Geraldine D. Mold for confection. 179,230, 11–13–56, Cl. D44—1.
Zanuso, Marco, and A. Scarsella. Paving tile. 179,231, 11–13–56, Cl. D18—3.
Ziegler, Alvin M., and J. Jeremias. Penholder. 179,232, 11–13–56, Cl. D74—1.

Charles, Daniel. 2,770,754.
Warnecke, Robert, and Dehler. 2,770,780.

Conciatori, Anthony B., and V. S. Salvin, to Celanese Corp. of America. Dyed textile materials and method of making. 2,770,518, 11-13-56, Cl. 8—18.

Conners, John: *See*—
Bader, Carl G., and Conners. 2,770,206.

Continental Meters Corp.: *See*—
Powell, Robert J. 2,770,511.

Continental Radiant Glass Heating Corp.: *See*—
Bazley, Emil W. 2,770,704.

Continental Steel Corp.: *See*—
Lee, Glenn E. 2,770,455.

Cooke, Reginald B. W.: *See*—
Reeves, Alec H., and Cooke. 2,770,740.

Cooley, Hilbu H., to Stanolind Oil and Gas Co. Detecting corrosion of well casing. 2,770,773, 11-13-56, Cl. 324—37.

Coolidge, Charles A.: *See*—
Cohn, Edwin J. 2,770,616.

Cora, Lawrence H., to Gulf Oil Corp. Polymerization process for preparing propylene tetramer. 2,770,666, 11-13-56, Cl. 260—683.15.

Cornwell, Ralph T. K., to American Viscose Corp. Cellulose compound film-forming composition and a regenerated cellulose film coated therewith. 2,770,555, 11-13-56, Cl. 106—172.

Courier-Citizen Co.: *See*—
Magarinos, Joseph, and Hoffman. 2,770,456.

Cowan, Leslie F.: *See*—
Perguna, Sidney W., and Cowan. 2,770,565.

Crane Co.: *See*—
Hjulian, Julius A. 2,770,422.

Creamer, Edgar M., Jr., to Philco Corp. Sound and color signal detection system. 2,770,673, 11-13-56, Cl. 178—5.4.

Crompton & Knowles Loom Works: *See*—
Turner, Richard G. 2,770,341.

Crooker, David E., to L. L. Fuller. Stud holders for use in tire molds. 2,770,013, 11-13-56, Cl. 18—36.

Crowell, Arnold B., H. A. Rotfort, and C. V. Mankiewicz, to International Business Machines Corp. Continuous form feeding apparatus in selective printing machines. 2,770,185, 11-13-56, Cl. 101—19.

Crown Cork & Seal Co., Inc.: *See*—
Breeback, Rudolph H. 2,770,263.
Day, Carl L., and Fauth. 2,770,342.
Erkardt, John E., Jr., and Grimes. 2,770,793.
Wilkens, Elbe A. 2,770,063.

Culverwell, Frank E. Front axle. 2,770,156, 11-13-56, Cl. 74—710.

Curioni, Aldo. Apparatus for handling spaghetti preparatory to packaging. 2,770,351, 11-13-56, Cl. 198—36.

Curtiss-Wright Corp.: *See*—
Stern, Robert G., and Simpson. 2,770,654.

Cuskie, Herman C., to Chrysler Corp. Automotive vehicle stabilizing means. 2,770,453, 11-13-56, Cl. 267—11.

Czyzewski, Mikolaj V., now by judicial change of name MacVictor Chelton. Double safety electrical receptacle. 2,770,786, 11-13-56, Cl. 339—40.

Dahm, Carl S. Container. 2,770,407, 11-13-56, Cl. 229—8.

Daimler-Benz Aktiengesellschaft: *See*—
Nallinger, Friedrich K. H. 2,770,147.

Dain, John: *See*—
Robertson-Shersby-Harvie, Robert B., and Dain. 2,770,781.

Dale, William C.: *See*—
Prager, Hans J., and Dale. 2,770,751.

Dalton, John F., C. A. Fischer, and W. G. Turnbull, Jr., to Bell Telephone Laboratories, Inc. Snap switch. 2,770,692, 11-13-56, Cl. 200—67.

Daisell, Clarence W., to Bendix Aviation Corp. Wind indicating and recording apparatus. 2,770,129, 11-13-56, Cl. 73—189.

Dandenaud, Raoul. Reserve sled. 2,770,465, 11-13-56, Cl. 280—12.

Danner, Eugene G. Piston rod and crank pin connection for aquarium pumps. 2,770,478, 11-13-56, Cl. 287—90.

Davis, Edgar G., to General Motors Corp. Grid bearing and method of making same. 2,770,500, 11-13-56, Cl. 308—37.

Davis, Elwood R., to Harrington & Richardson, Inc. Circular saw blade sharpening device. 2,770,152, 11-13-56, Cl. 76—36.

Day, Carl L., and F. R. Fauth, to Crown Cork & Seal Co., Inc. Container actuated divider. 2,770,342, 11-13-56, Cl. 198—31.

Dealaap Tree Service, Inc.: *See*—
Harrison, John O. 2,770,370.

Deary, John P. Missile and target device therefor. 2,770,460, 11-13-56, Cl. 273—105.

Deerdorf, Thomas F., to Paraflow, Inc. Paraffin removal process for oil wells. 2,770,307, 11-13-56, Cl. 166—11.

Deere & Co. : *See*—
Deere, John F., 2,770,361.
Dehart, Hubert H. and Dehart, Robert M., 2,770,180.
Delbert, Edward K. to Deltrit Abrasives Corp., Brake and clutching mechanism therefor, 2,770,320, 11-13-56.
Delmonte, Albert A. to Delmonte Corp., Brake and counterbalance mechanism, 2,770,180, 11-13-56, Cl. 188—18.
Demaree, Robert E. to Zenith Radio Corp., Brake arrangement for wire feeds, 2,770,361, 11-13-56, Cl. 188—18.
Demato, John A., to Demato Engineering Co., Oil mixer and container, 2,770,367, 11-13-56, Cl. 210—148.
Demeter, Joseph D., to Brimfield Oil and Gas Co., Automatic well-cleaning device, 2,770,182, 11-13-56, Cl. 166—22.
Demuth, Harold F., to Demuth Abrasives Corp., Brake and clutching mechanism therefor, 2,770,320, 11-13-56, Cl. 188—18.
Denny, George B., Brake shock adjuster, 2,770,231, 11-13-56, Cl. 188—196.
Denny, George E., Power operated means for a shock adjuster, 2,770,233, 11-13-56, Cl. 188—196.
Dentler, Otto H. to Thos. Alva Plastic Mold and Die Co., Layer feeder, 2,770,209, 11-13-56, Cl. 192—14

Gleaves, Paul F. M., and J. A. M. L. Gallavardin. Electronic distributor for counting and similar purposes. 2,770,417, 11-13-56, Cl. 235—61.

Göbel, Herwig: *See*—
Mittendrein, Michael, and Göbel. 2,770,464.

Goddard, Esther C.: *See*—
Goddard, Robert H. 2,770,251.
Goddard, Robert H. 2,770,255.

Goddard, Robert H., deceased, by E. C. Goddard, executrix, to The Daniel and Florence Guggenheim Foundation. ½ to The Daniel and Florence Guggenheim Foundation. Quick-acting reducing valve. 2,770,251, 11-13-56, Cl. 137—486.

Goddard, Robert H., deceased, by E. C. Goddard, executrix, to The Daniel and Florence Guggenheim Foundation. Dual-range safety valve. 2,770,255, 11-13-56, Cl. 137—529.

Gobel Tanaka & Co., Ltd.: *See*—
Utsumi, Isamu, and Harada. 2,770,624.

Gobrecht, Fernand P., to International Standard Electric Corp. Automatic telephone systems. 2,770,676, 11-13-56, Cl. 179—18.

Goldsmith, John L.: *See*—
Grandjean, Hulan E., and Goldsmith. 2,770,413.

Gonzalez, Luis. Automatic interrupter device for the electrical circuit in automobile vehicles in case of collision or over-turning of same. 2,770,689, 11-13-56, Cl. 200—61.52.

Good, Myron L., to the United States of America as represented by the United States Atomic Energy Commission. Linear accelerator. 2,770,755, 11-13-56, Cl. 315—5.

Goodman Mfg. Co.: *See*—
Hagenbook, Loy D. 2,770,319.
McCallum, Robert A. 2,770,377.
McCarthy, Timothy F. 2,770 378.
Miller, Frederick E. 2,770,353.
Miller, Frederick E. 2,770,448.

Goodrich, B. F., Co., The: *See*—
Hennagh, Frank. 2,770,282.
Schottenberger, Charles S. 2,770,612.

Gordon, Mack. Method of quenching metals. 2,770,564, 11-13-56, Cl. 148—13.1.

Gorton, Bert S., and B. L. Williams, to Monsanto Chemical Co. Process for the production of 2,4-diamino-6-chloro-s-triazine. 2,770,622, 11-13-56, Cl. 260—249.8.

Gossett, Corrine E.: *See*—
Gossett, John R. 2,769,962.

Gossett, John R., ½ to C. E. Gossett. Portable miniature urinal. 2,769,962, 11-13-56, Cl. 4—110.

Grangaard, Donald H., and A. W. Plummer, to Kimberly-Clark Corp. Method of patching an opening in a plane member. 2,770,556, 11-13-56, Cl. 117—2.

Grantham, Hulan E., and J. L. Goldsmith, to Hudson Engineering Corp. Wood fan ring. 2,770,413, 11-13-56, Cl. 230—132.

Graves, Benjamin P., to Brown & Sharpe Mfg. Co. Coolant return system. 2,770,172, 11-13-56, Cl. 90—11.

Gray, Sidney, to Radio Corp. of America. Cathode ray tube and target. 2,770,746, 11-13-56, Cl. 313—65.

Grayson, Harry, and R. A. G. Dunkley, to International Standard Electric Corp. Trigger circuits. 2,770,739, 11-13-56, Cl. 307—88.

Graziano, Victor: *See*—
Schlesinger, Kurt, and Graziano. 2,770,748.

Greenwood, Douglas, and H. A. Stevenson, to Roots Pure Drug Co. Ltd. P-chlorobenzyl sulfide and acaricidal composition containing the same. 2,770,568, 11-13-56, Cl. 167—30.

Greist Mfg. Co., The.: *See*—
Baehr, Carl G., and Connors. 2,770,206.

Griffith, Carroll L.: *See*—
Hall, Lloyd A., and Griffith. 2,770,559.

Griffith Laboratories, Inc., The: *See*—
Hall, Lloyd A. 2,770,549.

Gulf Oil Corp.: *See*—
Corn, Lawrence H. 2,770,665.

Gustafson, George W., to Lamb-Grays Harbor Co., Inc. Glue applying apparatus. 2,770,211, 11-13-56, Cl. 118—11.

Gustave, Miller: *See*—
Pszarowski, Stanley J. 2,770,366.

Gwaltney, Eugene C., to Saco-Lowell Shops. Spinning frame. 2,770,003, 11-13-56, Cl. 57—90.

Gyllby, Paul, and F. Zillikens, to American Home Products Corp. Enzymatic synthesis of N-acetylglucosaminide galactose and galactoside-N-acetyl glucosamine. 2,770,573, 11-13-56, Cl. 195—28.

Gyrodyne Co. of America, Inc.: *See*—
Losey, Arthur M. 2,770,149.

Haagens, Robert G., and L. Katz, to Raytheon Mfg. Co. Directly-cooled electromagnetic components. 2,770,765, 11-13-56, Cl. 336—61.

Haddad, James H., to Socony Mobil Oil Co., Inc. Method and apparatus for the conversion of liquid hydrocarbons in the presence of a granular contact material. 2,770,583, 11-13-56, Cl. 196—52.

Haensel, Vladimir, to Universal Oil Products Co. Saturating of a hydrocarbon fraction with hydrogen and then hydrodesulfurizing said fraction. 2,770,578, 11-13-56, Cl. 196—24.

Hagan Corp.: *See*—
Shafer, Joseph R., and Waxman. 2,770,246.

Hagemeyer, Hugh J., Jr., and E. L. Oglesby, to Eastman Kodak Co. Resinous products containing free hydroxyl radicals prepared by polymerizing acrylonitrile in admixture with an interpolymer of an alkenol and another unsaturated monomer. 2,770,607, 11-13-56, Cl. 260—80.2.

Hagenbook, Loy D., to Goodman Mfg. Co. Dust separator. 2,770,319, 11-13-56, Cl. 183—8.

Haigh, Edgar, and P. F. Keydel, to General Motors Corp. Combustion chamber. 2,770,227, 11-13-56, Cl. 123—191.

Haines, Robert M.: *See*—
Annable, Weldon G., Lucas, and Haines. 2,770,579.

Halahan, John, T. F. Arneson, and F. A. Lyon. Paper feeder. 2,770,458, 11-13-56, Cl. 271—29.

Hall, Lloyd A., and W. S. Kalchbrenner, to The Griffith Laboratories, Inc. Meat-curing salt composition. 2,770,548, 11-13-56, Cl. 99—222.

Hall, Lloyd A., to The Griffith Laboratories, Inc. Meat-curing salt composition. 2,770,549, 11-13-56, Cl. 99—222.

Hall, Lloyd A., and C. L. Griffith, to The Griffith Laboratories, Inc. Meat-curing salt composition. 2,770,550, 11-13-56, Cl. 99—222.

Hall, Lloyd A., and W. S. Kalchbrenner, to The Griffith Laboratories, Inc. Meat-curing salt composition. 2,770,551, 11-13-56, Cl. 99—222.

Hallden, Frederick C., to Hazeltine Research, Inc. Pulse-power amplifier. 2,770,686, 11-13-56, Cl. 179—171.

Halverson, Milton A., to Design-Rite Co. Boat trailer and anchoring strap therefor. 2,770,470, 11-13-56, Cl. 280—179.

Hamal, Heinrich: *See*—
Sieglitz, Adolf, and Hamal. 2,770,620.

Hamilton, Bertie F., deceased; W. S. Hamilton, executor. Spring-back chair. 2,770,292, 11-13-56, Cl. 155—157.

Hamilton, Francis E., G. V. Hawkins, R. E. Lawhead, Jr., and E. S. Hughes, Jr., to International Business Machines Corp. Data storage apparatus. 2,770,797, 11-13-56, Cl. 340—174.

Hamilton, William S.: *See*—
Hamilton, Bertie F. 2,770,292.

Hamm, Douglas W. to Muskegon Piston Ring Co. Unit piston ring. 2,770,512, 11-13-56, Cl. 309—44.

Hammill, Edward B., to Western Electric Co., Inc. Broaching tool for forming tapered openings in tubes. 2,770,174, 11-13-56, Cl. 90—33.

Hanscom, H. F., & Co., Inc.: *See*—
Hanscom, Harris F. 2,770,183.

Hanscom, Harris F., to H. F. Hanscom & Co., Inc. Tying machine. 2,770,183, 11-13-56, Cl. 200—10.

Hanslick, Roy S., and R. Bognah, to American Home Products Corp. Diarylalkylenediamine preparation. 2,770,653, 11-13-56 Cl. 260—570.9

Happoldt, William B., Jr.: *See*—
Barker, Harold C., Lewis, and Happoldt. 2,770,606.

Harada, Kiyoshi: *See*—
Utsumi, Isamu, and Harada. 2,770,624.

Hardy, Edgar E.: *See*—
Slocombe, Robert J., Hardy, and Saunders. 2,770,639.

Hardy, Edgar E., and T. Reetz, to Monsanto Chemical Co. Esters of epoxidised phosphonic acids and halogenated organic materials stabilised therewith. 2,770,610, 11-13-56, Cl. 260—45.8.

Harper, Carolyn L.: *See*—

Lee, Filemon T. Machine for shredding paper or the like into strips. 2,770,302, 11–13–56, Cl. 164—60.

Lee, Glenn R., to Continental Steel Corp. Spool and mandrel assembly. 2,770,425, 11–13–56, Cl. 242—46.2.

Lee, Smith: *See*—
Campbell, Colin L. 2,770,419.

Legge, George D., to General Motors Corp. Ash receiver or the like. 2,770,388, 11–13–56, Cl. 220—18.

Lents, John J., to International Business Machines Corp. Binary-decade counter. 2,770,725, 11–13–56, Cl. 250—27.

Leupold & Stevens Instruments, Inc.: *See*—
Stevens, John C. 2,770,133.

Lewis, Ernest E.: *See*—
Barker, Harold C., Lewis, and Happoldt. 2,770,608.

Libbey-Owens-Ford Glass Co.: *See*—
Gaiser, Romey A. 2,770,558.

Liberty Products Corp.: *See*—
Ochse, William. 2,770,173.

Lien, Arthur P.: *See*—
McCauley, David A., and Lien. 2,770,662.

Lindberg, Arthur F., to Teletypesetter Corp. Control unit for composing machines. 2,770,350, 11–13–56, Cl. 199—18.

Lindblom, Karl A. H., to Rodentin Aktiebolag. Process for the production of a bait for killing rodents, moles, and noxious animals. 2,770,067, 11–13–56, Cl. 43—124.

Lindeberg, Robert G., to Minnesota Mining & Mfg. Co. Container-feeder. 2,770,406, 12–13–56, Cl. 229—17.

Lindesmith, John L., to Clary Corp. Read-out and radix conversion apparatus for electronic computing apparatus. 2,770,415, 11–13–56, Cl. 235—61.

Linhardt, Charles, Jr., deceased; Mercantile Trust Co. of Baltimore, executor, to The Automatic Lite Co. Outlet box support. 2,770,436, 11–13–56, Cl. 248—57.

Linhof, Valentin: *See*—
Karpf, Nikolaus. 2,770,178.

Linton, Thomas B., to Kwikset Locks, Inc. Dead latch structure. 2,770,480, 12–13–56, Cl. 292—169.

Lisciani, Constantino, to The Protectoseal Co. Safety container. 2,770,890, 11–13–56, Cl. 220—88.

Lisenc, Georges: *See*—
Passet, Robert. 2,770,167.

Little, Hoyt: *See*—
Miller, William B., and Little. 2,770,554.

Livas, Giorgio. Plastic material bottle-seal. 2,770,383, 11–13–56, Cl. 215—55.

Long, Ray S., and R. H. Bailes, to the United States of America as represented by the United States Atomic Energy Commission. Recovery of uranium from phosphoric acid and phosphate solutions by ion exchange. 2,770,520, 11–13–56, Cl. 23—14.5.

Longstreth, Murrey O., and D. W. Ryan, to The Dow Chemical Co. Film stretching device. 2,770,007, 11–13–56, Cl. 18—1.

Lorentzen Hardware Mf'g. Corp.: *See*—
Bond, Scott R. 2,770,296.

Losey, Arthur M., to Gyrodyne Co. of America, Inc. Transmission, particularly for helicopter rotors. 2,770,149, 11–13–56, Cl. 74—665.

Louis Allis Co., The: *See*—
Wilson, Jack T., and Byers. 2,770,316.

Low, Irmentraut: *See*—
Kuhn, Richard, and Low. 2,770,618.

Lowdermilk, Ford R., and E. A. Bruce, to The Pennsylvania Salt Mfg. Co. Process for the manufacture of benzene hexachloride. 2,770,658, 11–13–56, Cl. 260—648.

Loween, Oscar L. Vanity case. 2,770,887, 11–13–56, Cl. 220—18.

Lucas, Kenneth: *See*—
Annable, Weldon G., Lucas, and Haines. 2,770,579.

Lufcy, Carroll W., to the United States of America as represented by the Secretary of the Navy. Vacuum tube controlled magnetic amplifier. 2,770,770, 11–13–56, Cl. 323—89.

Luke, Oren V.: *See*—
Horlenko, Theodore, Marcotte, and Luke. 2,770,661.
Mitchell, Robert L., and Luke. 2,770,637.

Lundburg, Frank J., to International Telephone and Telegraph Corp. Antennas. 2,770,800, 11–13–56, Cl. 343—757.

Luning, George A.: *See*—
Wilson, Lawrence A., Kamo, and Luning. 2,770,459.

Lunsford, James T. Door handling devices. 2,770,484, 11–13–56, Cl. 294—74.

Lushas, Franz R.: *See*—
Peteraitis, Hans H., and Zimmermann. 2,770,026.

Lynch, Charles S., to Phillips Petroleum Co. Production of synthetic resins by reaction of diolefin polymers with SO2. 2,770,603, 11–13–56, Cl. 260—29.7.

Lynch, William B.: *See*—
Jensen, Weldon H. 2,770,182.

Lyon, Floyd A.: *See*—
Halahan, John, Aronson, and Lyon. 2,770,458.

Lyon, George A. Method of coining and cupping metal. 2,770,034, 11–13–56. Cl. 29—534.

Lyons, J. & Co. Ltd.: *See*—
Clayson, Donald H. F. 2,770,575.

Maag Gear-Wheel and Machine Co., Ltd.: *See*—
Ernst, Daniel. 2,770,048.

MacCracken, Calvin D., to Jet-Heet, Inc. Air conditioning apparatus. 2,770,445, 11–13–56, Cl. 257—9.

Machlett Laboratories, Inc.: *See*—
Zarth, William A. 2,770,033.

MacKay, Kenneth H. Self-suspending disposable service box. 2,770,411, 11–13–56. Cl. 229—43.

MacLean, Alexander F.: *See*—
Smith, Eldred T., and MacLean. 2,770,585.

MacPhillamy, Harold B., to Ciba Pharmaceutical Products, Inc. Deserpidinol and salts thereof. 2,770,627, 11–13–56, Cl. 260—286.

Madland, Gabriel, to The Youngstown Steel Door Co. Sides for railway freight cars. 2,770,199, 11–13–56, Cl. 105—409.

Magarinos, Joseph, and F. C. Hoffman, to Courier-Citizen Co. Collator. 2,770,456, 11–13–56, Cl. 270—58.

Magic Seal, Inc.: *See*—
Rand, Henry J. 2,770,443.

Malone, Charles J. Telephone handset holder. 2,770,682, 11–13–56. Cl. 179—150.

Manfredi, Robert E., to General Electric Co. Fluid cooling arrangement for electric discharge devices. 2,770,745, 11–13–56, Cl. 313—44.

Mankiewicz, Chester V.: *See*—
Crowell, Arnold B., Reitfort, and Mankiewicz. 2,770,185.

Manley, Inc.: *See*—
Hodge, Walter D. 2,770,502.

Mansfield Sanitary Pottery, Inc.: *See*—
Smith, Harry F. 2,770,250.

Mantell, Russell M.: *See*—
Passino, Herbert J., Teeters, and Mantell. 2,770,660.

Marants, Israel H., to Columbia Cable & Electric Corp. Continuous flow spraying system. 2,770,212, 11–13–56, Cl. 118—51.

Marcotte, Frank B.: *See*—
Horlenko, Theodore, Marcotte, and Luke. 2,770,661.

Marcy, Henry T., to International Business Machines Corp. Display apparatus. 2,770,061, 11–13–56, Cl. 40—52.

Margrey, Frank R. Pulley guide. 2,770,142, 11–13–56, Cl. 74—240.

Marks, Max J.: *See*—
Schwartz, Martin W., and Marks. 2,770,717.

Marsh, Roger: *See*—
Kopf, Rowland J., and Marsh. 2,770,194.

Martenet, Simon J. Process for producing a mixed fertiliser. 2,770,539, 11–13–56, Cl. 71—36.

Martin, Tom E.: *See*—
Kahmann, Anthony R., and Martin. 2,770,533.

Martin, William F. Artificial fishing lure. 2,770,063, 11–13–56, Cl. 43—42.02.

Martinson, Edwin O., to Koehring Co. Boom. 2,770,372, 11–13–56. Cl. 212—144.

Martynse, Arthur: *See*—
Rogal, Edward H., and Martynse. 2,770,009.

Marx, Walter S., Jr., to Printing Arts Research Laboratories, Inc. Method and material for making overlay masks. 2,770,534, 11–13–56, Cl. 41—41.

Marxer, Adrian, to Ciba Pharmaceutical Products, Inc. 2,5-bis-ethyleneimino-hydroquinone and process for preparing same. 2,770,617, 11–13–56, Cl. 260—239.

Mason, John C. Device for removing articles from and inserting articles into pipelines. 2,770,332, 11–13–56, Cl. 29—203.

Massey-Harris-Ferguson (Sales) Ltd.: *See*—
Skerven, Theo. 2,770,249.

Matthews, Kenneth A.: *See*—
White, Charles de B., and Matthews. 2,770,762.

Matthews, Kenneth A., to International Standard Electric Corp. Electric crystal rectifiers. 2,770,763, 11–13–56, Cl. 317—234.

Matthe, Charles F., to Bell Telephone Laboratories, Inc. Non-intermittent projector for motion pictures. 2,770,163, 11–13–56, Cl. 88—16.8.

Mattson, Eddie P. Feed separating and feeding mechanism. 2,770,499, 11–13–56, Cl. 242—222.

Mawbey, Lawrence, to United Shoe Machinery Corp. Leather grading machine. 2,770,647, 11–13–56, Cl. 33—147.

Maynard, John T.: *See*—
Alderson, Witty L., Jr., and Maynard. 2,770,257.

Maynard, John T., to E. I. du Pont de Nemours and Co. Methods forming group metal ternary sulfides and their preparation. 2,770,528, 11–13–56, Cl. 23—134.

Mazzei, Joseph F.: *See*—
Peyton, Edward S. 2,770,288.

McAdie, Colin H., and C. K. Hooper, to Westinghouse Electric Corp. Load control with single control tube. 2,770,764, 11–13–56, Cl. 313—307.

McCallum, Robert A., to Goodman Mfg. Co. Suspension for vehicles such as shuttle cars. 2,770,377, 11–13–56, Cl. 214—83.24.

McCarthy, Timothy F., ⅜ to Goodman Mfg. Co. Scraper loader apparatus for mines. 2,770,378, 11–13–56, Cl. 214—83.

McCarthy, Vincent J., to The Salem Tool Co. Boring and breaker head for slack coal. 2,770,449, 11–13–56, Cl. 262—9.

McCauley, David A., and A. P. Lien, to Standard Oil Co. HF—BF₃ treating of secondary alkyltoluenes. 2,770,662, 11–13–56, Cl. 260—668.

McCreary, Harold J.: *See*—
Johnston, Leith, McCreary, and Stiles. 2,770,675.

McCulloch Motors: *See*—
Ryde, John L. 2,770,362.

McDonald, David W., and K. M. Taylor, to Monsanto Chemical Co. Purification of acrylonitrile. 2,770,645, 11–13–56, Cl. 260—465.9.

McDonnell & Miller, Inc.: *See*—
Kimlecik, Leopold J. 2,770,695.

McGill Mfg. Co., Inc.: *See*—
Smith, Richard J. 2,770,506.

McGrath, Earle J.: *See*—
Verrinder, Ernest A., and McGrath. 2,770,373.

McGraw Electric Co.: *See*—
Fjellstadt, Thorsten A. 2,770,702.

McGurk, Alfred N. Apparatus for observing fuel in fuel pressure systems of motor vehicles. 2,770,206, 11–13–56, Cl. 116—117.

McKeever, Charles H., and J. W. Nemec, to Rohm & Haas Co. Preparation of benzamitrile. 2,770,641, 11–13–56, Cl. 260—465.

McKendrey, Leo. Hospital chair. 2,770,289, 11–13–56, Cl. 155—45.

McNally, James A. Pneumatic mounting system. 2,770,433, 11–13–56, Cl. 248—22.

McNally, James A. Pneumatic mounting system. 2,770,434, 11–13–56, Cl. 248—22.

McNamara, Martin W., ½ to M. W. McNamara, Jr. Dumping hopper for lawn mowers and the like. 2,770,088, 11–13–56, Cl. 56—209.

McNamara, Martin W., Jr.: *See*—
McNamara, Martin W. 2,770,088.

McRae, Wayne A.: *See*—
Jude, Walter, and McRae. 2,770,776.

Mead, Howard C., to General Motors Corp. Plastic shield for flush-mounted headlamp. 2,770,714, 11–13–56, Cl. 240—8.1.

Mehltretter, Charles L., to the United States of America as represented by the Secretary of Agriculture. Electrolytic production of alkali salts of iodic acid. 2,770,589, 11–13–56, Cl. 204—95.

Mencacci, Samuel A., to Food Machinery and Chemical Corp. Bean sulfurer. 2,770,274, 11–13–56, Cl. 146—86.

Mercantile Trust Co. of Baltimore: *See*—
Linhardt, Charles, Jr. 2,770,436.

Mercier, Jacques H.: *See*—
Mercier, Jean and J. H. 2,770,297.

Mercier, Jean and J. H., to G. M. E. Corp. Hydraulically actuated articulated members. 2,770,297, 11–13–56, Cl. 160—188.

Mercier, Jean. Pressure switch. 2,770,694, 11–13–56, Cl. 200—83.

Merker, Robert L., to Dow Corning Corp. Hydroxyester substituted siloxanes. 2,770,631, 11–13–56, Cl. 260—448.2.

Merker, Robert L., to Dow Corning Corp. Carboxyester substituted siloxanes. 2,770,632, 11–13–56, Cl. 260—448.2.

Mestre, Luis, to The Mosler Safe Co. Depositing machines. 2,770,516, 11–13–56, Cl. 346—22.

Metal Hydrides Inc.: *See*—
Lander, Horace N. 2,770,526.

Metzger, Henry L., to Fort Orange Paper Co. Non-returnable bottle carrier. 2,770,391, 11–13–56, Cl. 220—112.

Michalsky, Peter. Press fastener. 2,770,023, 11–13–56, Cl. 24—153.

Michigan Tool Co.: *See*—
Monerieff, Alexander D. F. 2,770,171.

Miller, Emery P., to Ransburg Electro-Coating Corp. Apparatus for coating. 2,770,210, 11–13–56, Cl. 118—7.

Miller, Frederick B., to Goodman Mfg. Co. Takeup device for articulated conveyors and combining means therefor. 2,770,363, 11–13–56, Cl. 198—109.

Miller, Frederick B., to Goodman Mfg. Co. Extensible rotary cutter bar for boring type miner. 2,770,448, 11–13–56, Cl. 262—7.

Miller, Harold F. Collapsible tent frame. 2,770,243, 11–13–56, Cl. 135—4.

Miller, Harry, to Sperry Rand Corp. System for measuring the acceleration of a dirigible craft. 2,770,483, 11–13–56, Cl. 244—1.

Miller, Jos: *See*—
Battaglia, Eugene P., and Miller. 2,770,463.

Miller, Joseph P.: *See*—
Dilworth, Richard M., and Miller. 2,770,200.

Miller, Stuart P., to Allied Chemical & Dye Corp. Recovery of maleic anhydride. 2,770,630, 11–13–56, Cl. 260—346.8.

Miller, William B., R. H. Shaw, and H. Little, to Calanese Corp. of America. Viscose solution, a process for making it and a filament formed from it. 2,770,584, 11–13–56, Cl. 106—165.

Mine Safety Appliances Co.: *See*—
Brechetti, Raymond E. 2,770,321.

Minneapolis-Honeywell Regulator Co.: *See*—
Demay, Peter P. 2,770,442.
Exner, Frank M. 2,770,700.
Schuck, Oscar H., and Cassel. 2,770,429.
Vogel, Clarence E. 2,770,698.

Minnesota Mining & Mfg. Co.: *See*—
Lindeberg, Robert G. 2,770,466.

Mishcon, Lester: *See*—
Mishcon, Sam and L., and Aguinsk. 2,770,117.

Mishcon, Sam and L., and H. Aguinsk, to Supreme Knitting Machine Co. Inc. Yarn rack for circular knitting machine. 2,770,117, 11–13–56, Cl. 66—126.

Mitchell, Charles, and E. F. Buchman, to General American Transportation Corp. Molded plastic containers and methods of making the same. 2,770,396, 11–13–56, Cl. 220—4.

Mitchell, Lester F., and E. J. Janke, to Addressograph-Multigraph Corp. Sheet receiving tray for rotary printing machine. 2,770,192, 11–13–56, Cl. 101—240.

Mitchell, Robert L., and O. V. Lake, to Calanese Corp. of America. Production of oxygenated hydrocarbons. 2,770,637, 11–13–56, Cl. 260—451.

Mittendrein, Michael, and H. Göbel, to AVE Transportmittel holding A. G. Undercarriage for vehicles designed to run over uneven ground and, in particular, up and down stairs. 2,770,464, 11–13–56, Cl. 280—6.26.

Moen, Reid, to General Mills, Inc. Separator. 2,770,360, 11–13–56, Cl. 209—139.

Moesker, Gerard, to Hartford National Bank and Trust Co., as trustee. Tightening member for filaments. 2,770,753, 11–13–56, Cl. 313—278.

Moller, Kasper F., to Western Electric Co., Inc. Device for orienting and feeding articles. 2,770,352, 11–13–56, Cl. 198—34.

Möllers, Josef, to Hartford National Bank and Trust Co., as trustee. Device for the manufacture of ceramic mouldings. 2,770,025, 11–13–56, Cl. 25—37.

Monerieff, Alexander D. F., to Michigan Tool Co. Gear cutting device. 2,770,171, 11–13–56, Cl. 90—1.6.

Mönkemeyer, Karl, to Chemische Werke Huls Aktiengesellschaft. Process for the production of branched carbon chain aldehydes. 2,770,658, 11–13–56, Cl. 260—603.

Monsanto Chemical Co.: *See*—
Gorton, Bert S., and Williams. 2,770,622.
Hardy, Edgar E., and Reatz. 2,770,610.
Journeay, Glen E. 2,770,640.
McDonald, David W., and Taylor. 2,770,645.
Owens, Marvin L., Jr. 2,770,644.
Slocombe, Robert J., Hardy, and Saunders. 2,770,639.
Stanton, Walter H. 2,770,650.

Montgomery, Robert S., to The Dow Chemical Co. Preparation of beta-hydroxy-beta-phenyl-propionitrile and cinnamonitrile. 2,770,642, 11–13–56, Cl. 260—465.

Moody, Arthur M. G., to The Trane Co. Cooling water compressor unit of refrigerating apparatus. 2,770,106, 11–27–56, Cl. 62—117.8.

Moore, Charles E., and H. W. Stieglitz, to Thomson Welder Co. Electric flash-butt-welding machines. 2,770,709, 11–13–56, Cl. 219—97.

Moore, George A. Heavy and light duty container structure and method of making same. 2,770,400, 11–13–56, Cl. 229—23.

Moore, Maurice B. Electric bait getter. 2,770,075, 11–13–56, Cl. 47—1.3.

Morello, Victor S.: *See*—
Horsley, Lee H., Morello, and Poffenberger. 2,770,664.

Morse, Samuel A. Magazine socket wrenches. 2,770,157, 11–13–56, Cl. 81—125.

Morgan Development Laboratories, Inc.: *See*—
Morgan, Porter S. 2,770,155.

Morgan, Porter S., to Morgan Development Laboratories, Inc. Ball and helical race for mechanical movements. 2,770,155, 11–13–56, Cl. 81—36.

Morris, Joseph L. Means and method for producing knitted fabrics. 2,770,116, 11–13–56, Cl. 66—118.

Morrison, Robert L., to Silver Engineering Works, Inc., a division of the Silver Corp. Method and apparatus for drying treatment of solids in the fluidized or gas entrained state. 2,770,052, 11–13–56, Cl. 34—10.

Morrison, Willard L., to Union Stock Yards and Transit Co. of Chicago. Method of manufacturing and installing insulated staves for tank lining. 2,770,378, 11–13–56, Cl. 144—309.

Morrison, Willard L., to Chicago Stock Yards Company Co. Distributor fan compostor. 2,770,354, 11–13–56, Cl. 198—128.

Morrow, Malcolm. Standing and directive flood lighting system for vehicles. 2,770,697, 11–13–56, Cl. 200—33.

Moses, Harry, to the United States of America as represented by the United States Atomic Energy Commission. Electronic pressure differential wind direction indicator. 2,770,125, 11–13–56, Cl. 73—188.

Mosler Safe Co., The: *See*—

Lafey, Carroll W. 2,770,770.
Ribiet, Henry B. 2,770,774.

Neal, Stephen A. Circulating and rotating retrievable whipstock. 2,770,444, 11–13–56, Cl. 255—1.6.

Negus, Robert W., to Arnold O. Beckman, Inc. Dosimeter charging unit. 2,770,765, 11–13–56, Cl. 320—1.

Neighbour, Leonard B., and O. P. Lance, to Deere & Co. Hoisting apparatus for elevating and dumping vehicles. 2,770,375, 11–13–56, Cl. 214—46.34.

Nelles, Maurice, to Borg-Warner Corp. Flexible coupling. 2,770,113, 11–13–56, Cl. 64—12.

Nelson, Maurice O., to The Farmwell Co., Inc. Portable applicator for liquid fertilizers, weed killers, and the like. 2,770,494, 11–13–56, Cl. 299—43.

Nelson, Robert A., to General Electric Co. Winding arrangement using a tertiary winding. 2,770,767, 11–13–56, Cl. 323—43.5.

Nemec, Joseph W.: *See*—
McKeever, Charles H., and Nemec. 2,770,641.

Neo-Ray Products, Inc.: *See*—
Zingone, Anthony E. 2,770,438.

Nesset, Maurice M., and C. R. Broman, to Baxter Laboratories, Inc. Parenteral administration of liquids. 2,770,234, 11–13–56, Cl. 128—214.

Nesset, Maurice M., and C. R. Broman, to Baxter Laboratories, Inc. Parenteral administration of liquids. 2,770,235, 11–13–56, Cl. 128—214.

Nicholson, Albright M., and S. B. Elliott, to Ferro Corp. Solubilised 8-hydroxyquinoline and method of producing same. 2,770,626, 11–13–56, Cl. 260—270.

Niciaus, William L., to Wilpet Tool & Mfg. Co. Indicating device. 2,770,209, 11–13–56, Cl. 116—136.

Nitzsche, Siegfried, and R. Riedle, to Wacker Chemie G. m. b. H. Halogenated polymers stabilized with a hexaorganodistannoxane. 2,770,611, 11–13–56, Cl. 260—45.75.

Nolan, John J., to International Business Machines Corp. Dick strip printer. 2,770,188, 11–13–56, Cl. 101—93.

Nordberg Mfg. Co.: *See*—
Gruender, Oscar C. 2,770,423.

Nordholt, Louis E., and M. Wilholte, to Temco, Inc. Fuel burning wall space heater. 2,770,228, 11–13–56, Cl. 126—116.

Nordisk Insulinlaboratorium: *See*—
Eldon, Knud-Erik H. 2,770,572.

Nordlin, Henry G., and P. M. Koerner, to International Telephone and Telegraph Corp. Sizing of thermoplastic cable cores. 2,770,014, 11–13–56, Cl. 18—48.

Nordquist, Ronald E. J., to American Can Co. Conveyor mechanism for dividing single line of articles into double line. 2,770,349, 11–13–56, Cl. 198—31.

Northcutt, Roy C., and J. N. Staggs, to Borg-Warner Corp. Grinding apparatus. 2,770,061, 11–13–56, Cl. 51—103.

Northern Pump Co.: *See*—
Scheurich, John S. 2,770,703.

Norton Co.: *See*—
Uelts, Herbert F. G. 2,770,029.

Norton, Lowell E., to Radio Corp. of America. Frequency stabilization of oscillators. 2,770,733, 11–13–56, Cl. 250—36.

Novick, Abraham, to F. L. Smithe Machine Co., Inc. Method and apparatus for making open side envelopes. 2,770,176, 11–13–56, Cl. 93—62.

Ober, Howard C. Overload release friction coupling. 2,770,115, 11–13–56, Cl. 64—30.

O'Brien, Gerard J. Cake cutter and server. 2,770,035, 11–13–56, Cl. 30—114.

Ochse, William, to Liberty Products Corp. Mechanisms for controlling the angularity of milling machine cutters. 2,770,173, 11–13–56, Cl. 90—13.

Oglesby, Elisabeth L.: *See*—
Hagemeyer, Hugh J., Jr., and Oglesby. 2,770,607.

Ohlinger, Leo A.: *See*—
Wigner, Eugene P., Ohlinger, Young, and Weinberg. 2,770,591.

Olshei, John R., and H. C. Hueber, to Trico Products Corp. Windshield washer system. 2,770,017, 11–13–56, Cl. 20—40.5.

Okada, Shinzo, and T. Eguchi, ⅝ to Kurashiki Rayon Co., Ltd., and ⅜ to Air Reduction Co., Inc. Method of recovering fatty acid and alkali by the electrolysis of an aqueous solution of an alkali metal salt of a fatty acid. 2,770,588, 11–13–56, Cl. 204—72.

Oliva, Felix. Stem caliper. 2,770,045, 11–13–56, Cl. 33—143.

Olmsted, Elisabeth P., R. R. Francis, and I. G. Ross. Correction of the condition of strabismus in human vision. 2,770,164, 11–13–56, Cl. 88—20.

Longstreth, Murrey O., and Ryan. 2,770,007.

Ryckman, George E., to The Homer Laughlin China Co. Cup handle stroking machine. 2,770,214, 11–13–56, Cl. 118—242.

Ryde, John L., to McCulloch Motors Corp. Liquid delivering device. 2,770,363, 11–13–56, Cl. 210—46.

Rylock Co., Ltd.: *See*—
Rust, David J., and Jensen. 2,770,334.

Sacc-Lowell Shops: *See*—
Gwaltney, Eugene C. 2,700,093.

Sacre, Leo D., to Motorola, Inc. Coupling mechanism. 2,770,137, 11–13–56, Cl. 74—10.33.

St. Regis Paper Co.: *See*—
Lane, Gardiner. 2,770,406.

Salvin, Victor S.: *See*—
Conciatori, Anthony B., and Salvin. 2,770,518.

Sanders, Tillmon J. Electrically actuated burglar alarm and circuit closer therefor. 2,770,690, 11–13–56, Cl. 200—61.61.

Sauerman, Edward E. Device for dispensing measured quantities of coffee. 2,770,398, 11–13–56, Cl. 222—181.

Saunders, James H.: *See*—
Slocombe, Robert J., Hardy, and Saunders. 2,770,639.

Saurenman, Dean F., to Schlumberger Well Surveying Corp. Borehole apparatus operated by the well fluid. 2,770,308, 11–13–56, Cl. 166—65.

Saxton, Millard F.: *See*—
Comey, Charles S., Saxton, and Stuerzl. 2,770,003.

Schenley Industries, Inc.: *See*—
Schraufstätter, Ernst, and Bock. 2,770,619.

Scheurich, John S., to Northern Pump Co. Transducer. 2,770,703, 11–13–56, Cl. 201—63.

Schieffelin & Co.: *See*—
Treves, Gino R. 2,770,646.
Treves, Gino R. 2,770,647.

Schinske, William G., to Ideal Industries, Inc. Adjustable bite wire strippers. 2,770,154, 11–13–56, Cl. 81—9.5.

Schlesinger, Kurt, and V. Graziano, to Motorola, Inc. Deflection system. 2,700,748, 11–13–56, Cl. 313—78.

Schluchter, Alfred W., to General Motors Corp. Bearing. 2,700,031, 11–13–56, Cl. 29—197.

Schlumberger Well Surveying Corp.: *See*—
Krasnow, Shelley. 2,770,736.
Saurenman, Dean F. 2,770,308.
Schuster, Nick A. 2,770,771.

Schmidt, Gustav: *See*—
Korkowski, Eberhard, and Schmidt. 2,770,098.

Schmidt, Lewis W. Beet impelling device. 2,770,273, 11–13–56, Cl. 146—85.

Schnider, Otto.: *See*—
Frombera, Konrad, Gruessner, and Schnider. 2,770,569.

Schock, Alfred, to Alexander Smith, Inc. Spraying apparatus for web material. 2,770,216, 11–13–56, Cl. 118—323.

Schollenberger, Charles S., to The B. F. Goodrich Co. Elastomeric diisocyanate-modified polyesters. 2,770,612, 11–13–56, Cl. 260—75.

Schraufstätter, Ernst, and M. Bock, to Schenley Industries, Inc. Substituted 8-quinolinols. 2,770,619, 11–13–56, Cl. 260—240.

Schreffler, Robert Z. Aircraft construction. 2,770,427, 11–13–56, Cl. 244—2.

Schuck, Oscar H., and B. H. Ciscel, to Minneapolis-Honeywell Regulator Co. Automatic control systems. 2,770,429, 11–13–56, Cl. 244—77.

Schults, Ignatius C. Outlet box. 2,770,385, 11–13–56, Cl. 220—3.6.

Schurman, Jack V., to Colgate-Palmolive Co. Preparation of hydroxybenzoic esters by alcoholysis. 2,770,648, 11–13–56, Cl. 260—474.

Schuster, Nick A., to Schlumberger Well Surveying Corp. Well logging methods and apparatus. 2,770,771, 11–13–56, Cl. 324—1.

Schutte, Charles E. Semi-spherical compensating washer. 2,770,161, 11–13–56, Cl. 85—50.

Schuylkill Products Co., Inc.: *See*—
Bassett, Cecil E., and Bradfield. 2,770,374.

Schwartz, Martin W., and M. J. Marks. Electrical lighting fixture. 2,770,717, 11–13–56, Cl. 240—78.

Schwenninger, Earnest N., and J. H. Hoffman, to Celanese Corp. of America. Recording tensiometer. 2,770,127, 11–13–56, Cl. 73—143.

Scott, Harry E. Hold-down bar. 2,770,471, 11–13–56, Cl. 280—179.

Sears, Wesley E. Vehicle headlight. 2,770,713, 11–13–56, Cl. 240—7.1.

Seaton, Max Y., and R. D. Pike, K. B. Ray and The Stamford Trust Co., executors of said R. D. Pike, deceased, said Seaton assor. to Food Machinery and Chemical Corp. Production of pure sodium carbonate from Wyoming Trona. 2,770,524, 11–13–56, Cl. 23—63.

Sebac Nouvelle S. A.: *See*—
Coanda, Henri. 2,770,501.

Sebardt, Wilhelm, to International Ytong-Stabalite Co. Ltd. Portioning device for viscous masses. 2,770,395, 11–13–56, Cl. 222—28.

Seda, Edward C. Agricultural implement wheel scraper assembly. 2,770,469, 11–13–56, Cl. 280—158.

Sedlacek, Frank. Meter reading card container. 2,770,473, 11–13–56, Cl. 281—44.

Seegmiller, Walter R., to General Electric Co. Push-pull magnetic amplifier. 2,770,769, 11–13–56, Cl. 323—89.

Segesman, Louis E., to The Hoover Co. Suction cleaner having agitator drive in air stream and unobstructed fan inlet. 2,700,000, 11–13–56, Cl. 15—333.

Seibert, John W., to Borg-Warner Corp. Window structure. 2,700,018, 11–13–56, Cl. 20—52.2.

Seligman, Eustace: *See*—
Cohn, Edwin J. 2,770,616.

Seneca Falls Machine Co.: *See*—
Dinsmore, Arthur S. 2,770,141.

Serduke, James T., to the United States of America as represented by the United States Atomic Energy Commission. Reactor circulating system. 2,770,590, 11–13–56, Cl. 204—193.

Settineri, Thomas J., Sr., to Shapiro & Son Curtain Corp. Universal tufting machines. 2,770,205, 11–13–56, Cl. 112—79.

Sewell, Frederick R., to Percy Jones (Twinlock) Ltd. Loose leaf filing trays or binders. 2,770,238, 11–13–56, Cl. 129—16.

Seybold, Frederick W., to E. P. Lawson Co., Inc. Back gauge-planetary gear-brake disconnect for hydraulic drive. 2,770,301, 11–13–56, Cl. 164—39.

Shafer, Joseph R., and A. Waxman, to Hagan Corp. Multiple cam load devices for pressure regulators. 2,770,246, 11–13–56, Cl. 137—85.

Shalvoy, John C., and P. O. Rawson, Jr., to General Electric Co. Mobile vacuum cleaner having a hose adapted to be used as a pushing or pulling means therefor. 2,769,996, 11–13–56, Cl. 15—323.

Shapiro & Son Curtain Corp.: *See*—
Settineri, Thomas J., Sr. 2,770,205.

Sharwen, Theo, to Massey-Harris-Ferguson (Sales) Ltd. Control means for selective operation of valves. 2,770,249, 11–13–56, Cl. 137—333.

Sheahan, Robert E., to General Electric Co. Electric cord arrangement for vacuum cleaners. 2,769,997, 11–13–56, Cl. 15—324.

Sheahan, Robert E., to General Electric Co. Suction cleaner hose and handle arrangement. 2,769,999, 11–13–56, Cl. 15—327.

Sheard, William G., to General Container Corp. Carton. 2,770,357, 11–13–56, Cl. 206—7.

Sheffield Corp., The: *See*—
Laemmel, Charles H. 2,769,991.

Shell Development Co.: *See*—
Bergstrom, Roland F., Hodgson, and Hook. 2,770,530.

Shen, Yuin C., and H. D. Adkins, to the United States of America as represented by the Secretary of the Air Force. Hermetically sealed torque transmission system. 2,770,139, 11–13–56, Cl. 74—18.1.

Sherred, John A., to Monsanto Chemical Co. Process for the preparation of 2-amino-4,6-diphenoxy-s-triazine. 2,770,621, 11–13–56, Cl. 260—249.5.

Shivers, Paul F., to Robertshaw-Fulton Controls Co. Thermostatic control device. 2,770,699, 11–13–56, Cl. 200—138.

Shontz, Loran A., Jr.: *See*—
Andrews, Boley A., and Shontz. 2,770,343.

Sieglitz, Adolf, L. L. Berlin, and H. Hamal, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Sensitising dyestuffs. 2,770,620, 11–13–56, Cl. 260—240.4.

Sierra Electronic Corp.: *See*—
Turner, Thomas F. 2,770,779.

Sievers, Eldred D., to Unit Mfg. Co. Filter cartridge. 2,770,426, 11–13–56, Cl. 242—123.

Silver Engineering Works, Inc., a division of the Silver Corp.: *See*—
Morrison, Robert L. 2,770,052.

Silverman, Daniel, to Stanolind Oil and Gas Co. Seismic wave generation. 2,770,312, 11–13–56, Cl. 181—.5.

Simjian, Luther G., to The Reflectone Corp. Photographic system. 2,770,719, 11–13–56, Cl. 250—59.

Simpson, Duncan W.: *See*—
Stern, Robert G., and Simpson. 2,770,054.

Singleton, Richard H., to National Research Corp. Method of producing titanium. 2,770,541, 11–13–56, Cl. 75—84.5.

Skirvin, Chester C., to Trimble, Inc. Dressing table screen guard supporting means for infant's bath stand. 2,769,983, 11–13–56, Cl. 4—177.

Skirvin, Chester C., to Trimble, Inc. Screen guard structure for metal dressing table of infant's bath stand. 2,769,984, 11–13–56, Cl. 4—177.

Skirvin, Chester C., to Trimble, Inc. Article pocket for infant's folding bath stand. 2,769,985, 11–13–56, Cl. 4—177.

Skirvin, Chester C., to Trimble, Inc. Dressing table supporting means for infant's bath stand. 2,769,986, 11–13–56, Cl. 4—177.

Skoglund, Bertil J.: *See*—
Doering, Charles and H. 2,770,039.

Skoglund, Bertil J., to C. and H. Doering. Automatic feed synchronising mechanism for substances preparatory to processing. 2,770,038, 11–13–56, Cl. 31—8.

Skolnik, Marvin, to The Weldon Tool Co. Vacuum pump. 2,770,414, 11–13–56, Cl. 230—149.

Slaght, William W., to Cleveland Steel Products Corp. Universal joint assembly. 2,770,114, 11–13–56, Cl. 64—17.

Sloan Valve Co.: *See*—
Filliung, Jacques J., and Campbell. 2,770,498.
Filliung, Jacques J., and Swarts. 2,770,497.

Slocombe, Robert J., E. E. Hardy, and J. H. Saunders, to Monsanto Chemical Co. Method of producing aliphatic and alicyclic carbonates. 2,770,639, 11–13–56, Cl. 260—463.

Smith, Alexander, Inc.: *See*—
Runton, Leslie A., and Bejeuhr. 2,770,283.
Schock, Alfred. 2,770,216.

Smith, Allen E., A. W. Feldman, and G. M. Stone, to United States Rubber Co. N-1-naphthylphthalamic acid herbicidal compositions. 2,770,537, 11–13–56, Cl. 71—2.4.

Smith, Baynard R., to Steatite Research Corp. Multiple solder-seal bushing. 2,770,669, 11–13–56, Cl. 174—152.

Smith, Carlisle F., to J. I. Case Co. Baling machine. 2,770,184, 11–13–56, Cl. 100—19.

Smith, Eldred T., and A. F. Maclean, to Celanese Corp. of America. Purification of acids containing 2 to 6 carbon atoms. 2,770,585, 11–13–56, Cl. 202—59.

Smith, Harry F., to Mansfield Sanitary Pottery, Inc. Inlet valve for flush tanks. 2,770,250, 11–13–56, Cl. 137—426.

Smith, Keith L., to Union Carbide and Carbon Corp. Soil conditioning with alkenyl succinic compounds. 2,770,077, 11–13–56, Cl. 47—58.

Smith, Richard J., to McGill Mfg. Co., Inc. Cam follower bearing. 2,770,506, 11–13–56, Cl. 308—187.1.

Smith, Robert F., to Chrysler Corp. Brake shoe adjuster and release mechanism. 2,770,333, 11–13–56, Cl. 188—216.

Smith, Victor W., to C. V. Hill & Co., Inc. Refrigerated display case. 2,770,101, 11–13–56, Cl. 62—4.

Smith Welding Equipment Corp.: *See*—
Falk, Tage. 2,770,231.
Falk, Tage. 2,770,232.

Smith, Wesley A., to Tilt-A-Door Corp. Improved mounting construction for overhead door latch. 2,770,005, 11–13–56, Cl. 16—146.

Smithe, F. L., Machine Co., Inc.: *See*—
Novick, Abraham. 2,770,176.

Smits, Wytse B., to Smitswonk N. V. Low tension surface discharge spark plug. 2,770,750, 11–13–56, Cl. 313—131.

Snow, John E., to Acme Precision Products, Inc. Aircraft barrier. 2,770,431, 11–13–56, Cl. 244—110.

Socony Mobil Oil Co., Inc.: *See*—
Bourguet, Jean M. 2,770,503.

Tenney, William L. Space heater. 2,770,226, 11–13–56, Cl. 123—142.5.

Tessaro, Nicholas. Supplemental lens-positioning means. 2,770,168, 11–13–56, Cl. 88—41.

Testor, Nils F.: *See*—
Bast, Nathan G. 2,770,072.

Textron Inc.: *See*—
Anderson, Albert E. 2,770,036.

Thal, Harry A. Sofa bed. 2,769,967, 11–13–56, Cl. 5—37.

Tholstrup, Henry L., to International Business Machines Corp. Relay storage unit. 2,770,304, 11–13–56, Cl. 164—113.

Thomas, Chester L. Adjustable motorised chairs. 2,770,233, 11–13–56, Cl. 128—33.

Thomas, David L.: *See*—
Clavier, Andre G., and Thomas. 2,770,783.

Thomas, Robert E., to the United States of America as represented by the United States Atomic Energy Commission. Limited amplifier. 2,770,684, 11–13–56, Cl. 179—171.

Thompson, Billy V. Carpet gripper molding. 2,770,002, 11–13–56, Cl. 16—7.

Thompson, James S., to Coal Industry (Patents) Ltd. Scraper buckets. 2,770,058, 11–13–56, Cl. 37—147.

Thompson Products, Inc.: *See*—
Fairweather, Stephen H. 2,770,726.
Jones, Ernest A. 2,770,801.

Thompson, Ralph B., to Universal Oil Products Co. Stabilisation of organic compounds. 2,770,545, 11–13–56, Cl. 99—163.

Thompson, Ralph B., to Universal Oil Products Co. Metal deactivators. 2,770,546, 11–13–56, Cl. 99—163.

Thomson Welder Co.: *See*—
Moore, Charles D., and Stieglitz. 2,770,709.

Tilt-A-Door Corp.: *See*—
Smith, Wesley A. 2,770,005.

Tischer, Ernst M. Liquid filters. 2,770,368, 11–13–56, Cl. 210—164.

Tonkowich, William, to Waterman Pen Co., Inc. Fountain pen. 2,770,221, 11–13–56, Cl. 120—50.

Toohe, Richard C., to E. I. du Pont de Nemours and Co. Ferro-magnetic cobalt and nickel manganese oxides having the ilmenite-type crystal structure. 2,770,528, 11–13–56, Cl. 23—58.

Trane Co., The: *See*—
Moody, Arthur M. G. 2,770,106.

Trapp, Walter B., to The Dow Chemical Co. Catalytic regeneration of phenylacetaldehyde from its trimer. 2,770,654, 11–13–56, Cl. 260—599.

Treves, Gino B., to Schieffelin & Co. Quaternary ammonium compounds of basic esters of 2-aryl-2-(1-hydroxycyclohexyl) ethanolic acids. 2,770,646, 11–13–56, Cl. 260—473.

Treves, Gino B., to Schieffelin & Co. Quaternary ammonium compounds of basic esters of 2-aryl-2-(1-hydroxycyclopentyl) ethanolic acids. 2,770,647, 11–13–56, Cl. 260—473.

Triangle Specialties Inc.: *See*—
Rosenzweig, Philip. 2,770,200.

Trico Products Corp.: *See*—
Oishei, John R., and Hueber. 2,770,017.

Triggs, Kenneth F. Odor and smoke consumer. 2,770,318, 11–13–56, Cl. 183—6.

Trimble, Inc.: *See*—
Skirvin, Chester C. 2,769,983.
Skirvin, Chester C. 2,769,984.
Skirvin, Chester C. 2,769,985.
Skirvin, Chester C. 2,769,986.

Tru Colour Film Ltd.: *See*—
Burt, Gordon H. 2,770,542.

Tubiolo, Justin L. Liquid detergent dispenser. 2,770,242, 11–13–56, Cl. 134—48.

Turnbull, William G., Jr.: *See*—
Dalton, John F., Fischer, and Turnbull. 2,770,692.

Turner, Richard G., to Crompton & Knowles Loom Works. Loom operating with stationary weft supply. 2,770,261, 11–13–56, Cl. 139—126.

Turner, Thomas F., to Sierra Electronic Corp. Directional coupler. 2,770,779, 11–13–56, Cl. 333—10.

Turtle, Rupert C., to Arens Controls Ltd. Drive control and transmission mechanism. 2,770,454, 11–13–56, Cl. 268—21.

Ueltz, Herbert F. G., to Norton Co. Composite electrical resistor. 2,770,029, 11–13–56, Cl. 29—182.2.

Ulanet, Herman. Thermostatic switch. 2,770,698, 11–13–56, Cl. 200—138.

Ulvad, Bernhard. Music study device. 2,770,160, 11–13–56, Cl. 84—470.

Underwood Corp.: *See*—
Sundstrand, Oscar J., and Swanson. 2,770,344.
Swanson, Oscar W. 2 770,187.

Union Carbide and Carbon Corp.: *See*—
Burkart, Walter E. 2,770,710.
Smith, Keith L. 2,770,077.

Union Ice Co., The: *See*—
Rear, James C. 2,770,111.

Union Stock Yards and Transit Co. of Chicago: *See*—
Morrison, Willard L. 2,770,272.

Unit Mfg. Co.: *See*—
Sievers, Eldred D. 2,770,426.

United-Carr Fastener Corp.: *See*—
Becker, Philip D. 2 770,435.

United Kingdom Atomic Energy Authority: *See*—
Watt, Dudley A. 2,770,196.

United Shoe Machinery Corp.: *See*—
Mawbey, Lawrence. 2,770,047.

United Specialties Co.: *See*—
Drennes, John J. 2,770,320.

United States Atomic Energy Commission, United States of America as represented by the: *See*—
Balles, Richard H., and Grinstead. 2,770,522.
Good, Myron L. 2,770,755.
Klein, Rudolph J. 2,770,754.
Long, Ray S., and Balles. 2,770,520.
Moses, Harry. 2,770,128.
Serduke, James T. 2,770,590.
Spiegler, Louis. 2,770,521.
Thomas, Robert E. 2,770,684.
Wigner, Eugene P., Ohlinger, Young, and Weinberg. 2,770,591.

U. S. Industries, Inc.: *See*—
Johansen, Einar K. 2,770,342.

United States Rubber Co.: *See*—
Smith, Allen E., Feldman, and Stone. 2,770,537.

Universal Oil Products Co.: *See*—
Grote, Henry W. 2,770,663.
Haensel, Vladimir. 2,770,578.
Thompson, Ralph B. 2,770,545.
Thompson, Ralph B. 2,770,546.

Universal Vendor Co.: *See*—
Gale, Ronald. 2,770,393.

Urtel, Rudolf, to International Standard Electric Corp. Frequency control circuit. 2,770,730, 11–13–56, Cl. 250—36.

Utley, George D., and S. Hirsch. Surgical needle and method for blood transfusion or intravenous feeding. 2,770,236, 11–13–56, Cl. 128—221.

Utsumi, Isamu, and K. Harada, to Gobei Tanabe & Co., Ltd. Preparation of new thiamine salts. 2,770,624, 11–13–56, Cl. 260—256.6.

Vance, John J., and E. Chu Yen, to American Cyanamid Co. Soft gelatin capsule provided with internal barrier. 2,770,571, 11–13–56, Cl. 167—83.

Vance, Paul A., to General Electric Co. Static electrical pulsation apparatus. 2,770,738, 11–13–56, Cl. 307—88.

Van Gelder, Gonewijn: *See*—
Verveet, Wilhelmus L., van Gelder, and Waarlé. 2,770,136.

Veburg, John C.: *See*—
Kistner, Harold J., and Veburg. 2,770,189.

Vendo Co., The: *See*—
Andrews, Boley A., and Shonts. 2,770,343.
Hedges, Charles S. 2,770,418.

Vernig, Graham R., to Food Machinery and Chemical Corp. Dispensing apparatus for powdered materials. 2,770,396, 11–13–56, Cl. 222—70.

Verrinder, Ernest A., and E. J. McGrath, to Food Machinery and Chemical Corp. Machine for stacking boxes, cases, and the like. 2,770,373, 11–13–56, Cl. 214—6.

Verveet, Wilhelmus L., G. van Gelder, and G. H. Waarlé, to Hartford National Bank and Trust Co., as trustee. Shaft positioning mechanism. 2,770,136, 11–13–56, Cl. 74—10.2.

Vevirit, James V., and A. Gingo, to J. A. Wilson Lighting & Display Ltd. Means for connecting adjoining units of louvered grid lighting fixtures. 2,770,336, 11–13–56, Cl. 189—84.

Vierling, Donald E. Liquid fertilizers. 2,770,538, 11–13–56, Cl. 71—29.

Vierling, Donald E. Liquid fertilizers. 2,770,540, 11–13–56, Cl. 71—43.

Vogel, Clarence E., to Minneapolis-Honeywell Regulator Co. Automatic steering mechanism. 2,770,428, 11–13–56, Cl. 244—77.

Vögtle, Friedrich and J. Method and device of heating spraying agents. 2,770,706, 11–13–56, Cl. 219—39.

Vögtle, Johann: *See*—
Vögtle, Friedrich and J. 2,770,706.

Voigtlander, A. G.: *See*—
Faulhaber, Fritz. 2,770,177.

Vore, Milton P., and H. M. Kroft, to Westinghouse Electric Corp. Vibration pickup. 2,770,741, 11–13–56, Cl. 310—8.7.

Vrieselaar, Arthur D. Photographic exposure device. 2,770,165, 11–13–56, Cl. 88—24.

Waarlé, Godfried H.: *See*—
Verveet, Wilhelmus L., van Gelder, and Waarlé. 2 770,136.

Wacker Chemie G. m. b. H.: *See*—
Nitzsche, Siegfried, and Riedle. 2,770,611.

Walker, Scott W., to Stanolind Oil and Gas Co. Method for gasification of solid fuels. 2,770,536, 11–13–56, Cl. 48—206.

Walker, William C. Cooling systems for engines that utilize heat. 2,770,097, 11–13–56, Cl. 60—39.55.

Walker, Willie J. Fishing apparatus. 2,770,065, 11–13–56, Cl. 43—89.

Wallach, Bernard H., to Kearfott Co., Inc. Servo system and servomotor with built-in damping action. 2,770,743, 11–13–56, Cl. 310—74.

Wallgren, August G. F. Double row roller bearing. 2,770,509, 11–13–56, Cl. 308—214.

Wallin, Curtiss C.: *See*—
Honeycutt, Earl M., and Wallin. 2,770,580.

Walter, Karl A.: *See*—
Garvey, Louis P., Walter, and Ballard. 2,770,489.

Walton, Richard R., to Walton Washing Machine Corp. Washing or scrubbing device with oscillating scrubbing member having a vertical component of motion. 2,770,118, 11–13–56, Cl. 68—28.

Walton, Richard R., to Walton Washing Machine Corp. Washing device with means for injecting air bubbles in the washing liquid. 2,770,119, 11–13–56, Cl. 68—28.

Walton, Richard R., to Walton Washing Machine Corp. Washing device with rotary scrubber. 2,770,120, 11–13–56, Cl. 68—28.

Walton, Richard R., to Walton Washing Machine Corp. Washing device, including jet means for circulating the articles being washed. 2,770,123, 11–13–56, Cl. 68—184.

Walton Washing Machine Corp.: *See*—
Walton, Richard R. 2,770,118.
Walton, Richard R. 2,770,119.
Walton, Richard R. 2,770,120.
Walton, Richard R. 2,770,123.

Warnecke, Robert, and O. Dohler, to Compagnie Generale de Telegraphie Sans Fil. Symmetrical interdigital line for travelling wave tubes. 2,770,780, 11–13–56, Cl. 333—31.

Waterman Pen Co., Inc.: *See*—
Tonkowich, William. 2,770,221.

Watt, Dudley A., to United Kingdom Atomic Energy Authority. Electromagnetic interaction pump. 2,770,196, 11–13–56, Cl. 103—1.

Waxman, Aaron: *See*—
Shafer, Joseph R., and Waxman. 2,770,246.

Way, Roy C. Hydraulic lift for the saw boom of tractor operated saws. 2,770,266, 11–13–56, Cl. 143—43.

Wayman, Robert W., to Borg-Warner Corp. Transmission. 2,770,148, 11–13–56, Cl. 74—472.

Wayman, Robert W., to Borg-Warner Corp. Brake mechanism. 2,770,326, 11–13–56, Cl. 188—69.

Wedemeyer, Karlfried, and D. Delfs, to Farbenfabriken Bayer Aktiengesellschaft. Insectidal compositions of esters of thiomophosphoric acid stabilized by organic sulfates or sulfonates. 2,770,567, 11–13–56, Cl. 167—22.

Weichselbaum, Theodore E., to A. S. Aloe Co. Method of preparing bilirubin standardized reagents. 2,770,601, 11–13–56, Cl. 252—408.

Weichselbaum, Theodore E., to A. S. Aloe Co. Method of preparing protein standardized reagents. 2,770,602, 11–13–56, Cl. 252—408.

Weidenheimer, Joseph F., and F. M. Callahan, to American Cyanamid Co. Soft gelatin encapsulation. 2,770,553, 11–13–56, Cl. 106—136.

Weinberg, Alvin M.: *See*—
Wigner, Eugene P., Ohlinger, and Young, and Weinberg. 2,770,591.

Weinecke, Laurence A.: *See*—
Bonnanzwahl, Albert F., and Weinecke. 2,770,130.

Welch, Nicholas A. to The American Hardware Corp. Door lock. 2,770,124, 11–13–56, Cl. 70—146.

Weldon Tool Co., The: *See*—
Sholnik, Marvin. 2,770,414.

Weller, James O., to E. F. Pohl. Self-leveling seat structure. 2,770,236, 11–13–56, Cl. 155—5.

Welsch, Otis D. Vacuum flotation and liquid purification apparatus and process. 2,770,365, 11–13–56, Cl. 210—53.

Western Electric Co., Inc.: *See*—
Hammill, Edward B. 2,770,174.
Meller, Kasper F. 2,770,352.

Western Union Telegraph Co., The: *See*—
Zabriskie, Douglas M. 2,770,517.

Westinghouse Air Brake Co.: *See*—
Agnew, Edward J. 2,770,775.

Westinghouse Electric Corp.: *See*—
Atti, Eros. 2,770,557.
McAdie, Colin H., and Hopper. 2,770,764.
Penney, James H. 2,770,338.
Vore, Milton P., and Kroft. 2,770,741.

Weyenberg, Donald R., to Dow Corning Corp. Method of producing vinylchlorosilanes. 2,770,634, 11–13–56, Cl. 260—448.2.

White, Charles de B., and K. A. Matthews, to International Standard Electric Corp. Crystal triodes. 2,770,762, 11–13–56, Cl. 317—235.

White, William E., to Bendix Aviation Corp. Brake assembly. 2,770,327, 11–13–56, Cl. 188—78.

White, William E., and J. R. Clark, to said J. R. Clark and T. Somerville, as trustees. Pallets and containers for transporting brick and the like. 2,770,359, 11–13–56, Cl. 206—65.

Whitehead, William, to Celanese Corp. of America. Packaging nitrogen-containing explosives. 2,770,195, 11–13–56, Cl. 102—97.

Whitehill, Albert J. Dirt guards. 2,770,309, 11–13–56, Cl. 166—65.

Whitesell, Harry. Grinding and polishing and the like. 2,770,082, 11–13–56, Cl. 51—141.

Whitin Machine Works: *See*—
Dudley, John S. 2,770,016.
Wood, Earl S. 2,770,092.

Whittle, William F. Hobby horse. 2,770,290, 11–13–56, Cl. 155—50.

Whitwell, Oren E. Magnetic memo holders. 2,770,472, 11–13–56, Cl. 281—15.

Wichmann, Wilhelm. Measuring instrument. 2,770,046, 11–13–56, Cl. 33—143.

Wigner, Eugene P., L. A. Ohlinger, G. J. Young, and A. M. Weinberg, to the United States of America as represented by the United Sttaes Atomic Energy Commission. Heavy water moderated neutronic reactor. 2,770,591, 11–13–56, Cl. 204—193.

Wilckens, Elbe A., to Crown Cork & Seal Co., Inc. Tube handling apparatus. 2,770,083, 11–13–56, Cl. 53—76.

Wilhoite, Murray: *See*—
Nordholt, Louis E., and Wilhoite. 2,770,228.

Wilkens, Ernst H. Hide-stripping devices. 2,770,006, 11–13–56, Cl. 17—21.

Williams, Byron L.: *See*—
Gorton, Bert S., and Williams. 2,770,622.

Williams, R. N., Paper Co.: *See*—
Williams, Richard N. 2,770,405.

Williams, Richard N., to R. N. Williams Paper Co. Shirt collar support. 2,770,405, 11–13–56, Cl. 223—83.

Williamson, Marshall I. Hollow-walled boxes. 2,770,410, 11–13–56, Cl. 229—34.

Willingham, Elijah N. Vehicle sway stabilizer. 2,770,468, 11–13–56, Cl. 280—112.

Wilpet Tool & Mfg. Co.: *See*—
Niciana, William L. 2,770,209.

Wilson, Earl. Automobile drier. 2,770,496, 11–13–56, Cl. 299—58.

Wilson, George A., to Fabreeka Products Co. Railway-tie pad. 2,770,421, 11–13–56, Cl. 238—283.

Wilson, J. A., Lighting & Display Ltd.: *See*—
Yevirir, James V., and Gingo. 2,770,336.

Wilson, Jack T., and R. J. Byers, to The Louis Allis Co. Apparatus for collecting air contaminants. 2,770,316, 11–13–56, Cl. 183—2.

Wilson, Lawrence A., B. V. Kamp, and G. A. Luning, to International Business Machines Corp. Stepping device for card feeding machines. 2,770,459, 11–13–56, Cl. 271—57.

Wilson, Wayne E. Golf ball repaint fixture. 2,770,218, 11–13–56, Cl. 118—503.

Wimpfheimer, Harry E. Apparatus for pre-positioning printing plates. 2,770,049, 11–13–56, Cl. 33—184.5.

Winkler, Albert H., to Bendix Aviation Corp. Automotive vehicle control mechanism. 2,770,146, 11–13–56, Cl. 74—472.

Winkler, Albert H., to Bendix Aviation Corp. Starter switch. 2,770,691, 11–13–56, Cl. 200—61.9.

Winkler, Joseph, to American Collo Corp. Tobacco smoke filter and method. 2,770,241, 11–13–56, Cl. 131—208.

Winkler, Richard, and K. Dunnebier, to Berkley Machine Co. Apparatus for applying cuts in envelope blanks and the like. 2,770,303, 11–13–56, Cl. 164—64.

Wood, Earl S., to Whitin Machine Works. Brake for spinning or twisting spindle. 2,770,092, 11–13–56, Cl. 57—88.

Wood, Walter F., to The State of Iowa, for the use and benefit of the State University of Iowa, an educational institution of the State of Iowa. Device and method for measuring surface areas. 2,770,044, 11–13–56, Cl. 33—121.

Woodford, George H. Bedclothes anchor. 2,769,989, 11–13–56, Cl. 5—320.

Woods, John E., to Standard-Thomson Corp. Pilot-controlled hydraulic valve. 2,770,440, 11–13–56, Cl. 251—28.

Worbrock, Marvin T., to General Motors Corp. Clutch assembly. 2,770,341, 11–13–56, Cl. 192—68.

Worley, George A.: *See*—
Stafford, Neil S., and Worley. 2,770,439.

Yarrick, Charles J., to I-T-E Circuit Breaker Co. Escutcheon design for circuit breakers. 2,770,701, 11–13–56, Cl. 200—167.

Yeandle, William W., N. A. Carter, and J. T. Purnell, to Deere & Co. Apparatus for producing urea prills. 2,770,008, 11–13–56, Cl. 18—2.4.

Young, Gale J.: *See*—
Wigner, Eugene P., Ohlinger, and Young, and Weinberg. 2,770,591.

Youngstown Steel Door Co., The: *See*—
Blomberg, Harry. 2,770,198.
Madland, Gabriel. 2,770,199.

Zabriskie, Douglas M., to The Western Union Telegraph Co. Facsimile scanning mechanism. 2,770,517, 11–13–56, Cl. 346—74.

Zallea, James P. Expansion joint and apparatus for and method of making same. 2,770,259, 11–13–56, Cl. 138—52.

Zalm, Pieter: *See*—
Bril, Alfred, Klaseas, and Zalm. 2,770,749.

Zant, Fred: *See*—
Jones, David W., and Zant. 2,770,074.

Zarth, William A., to Machlett Laboratories, Inc. Method of soldering a thin beryllium member to a metal part. 2,770,033, 11–13–56, Cl. 29—488.

Zenith Radio Corp.: *See*—
Druz, Walter S. 2,770,672.
Ellett, Alexander. 2,770,671.
Ellett, Alexander. 2,770,803.

Zerbe, Howard E. Awning and canopy structures. 2,770,020, 11–13–56, Cl. 20—57.5.

Zilliken, Friedrich: *See*—
Gubrgy, Paul, and Zilliken. 2,770,573.

Zimmermann, Erich O.: *See*—
Petersille, Hans H., and Zimmermann. 2,770,026.

Zingone, Anthony E., to Neo-Ray Products, Inc. Connector structure. 2,770,438, 11–13–56, Cl. 248—317.

Zinn, Donald V. Motor vehicle body of the self-unloading type. 2,770,376, 11–13–56, Cl. 214—83.32.

# CLASSIFICATION OF PATENTS

## ISSUED NOVEMBER 13, 1956

NOTE.—First number—class, second number—subclass, third number—patent number

| | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1— | 187: | 2,769,978 | 34— | 10: | 2,770,052 | 73— | 428 | 2,770,135 | 117— | 33.5: | 2,770,557 | 155— | 50: | 2,770,200 | 196— | 52: | 2,770,563 |

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington 25, D. C., to whom all subscriptions should be made payable and all communications addressed. Subscription price, $10.50 per annum, foreign mailing $2.60 additional; single copies, 20 cents each.

# MARKS PUBLISHED FOR OPPOSITION

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.

As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.

## CLASS 1

### RAW OR PARTLY PREPARED MATERIALS

SN 691,474. Honeymead Products Company, Mankato, Minn. Filed July 18, 1955.

**LAMISOY**

For Defatted Soy Flour Used for General Industrial Purposes.
First use Apr. 22, 1955.

SN 693,131. Carl Freudenberg Kommanditgesellschaft auf Aktien, Weinheim an der Bergstrasse, Germany. Filed Aug. 16, 1955.

**HARRA**

Priority claimed under Sec. 44(d) on German application No. F 5581, filed Feb. 16, 1955; Reg. No. 679,282, dated July 19, 1955.
For Synthetic Leather and Synthetic Guts, Made Out of Synthetic Fiber Materials.

SN 697,831. E. H. Pratt, d. b. a. Kel-Min Distributing Co., Kansas City, Mo., to Kelp Minerals, Inc., Kansas City, Mo. Filed Nov. 7, 1955.

**KEL-MIN**

For Raw Ground Marine Vegetation Sold as Such for Use as an Ingredient in Fertilizers and in Livestock and Poultry Feed.
First use Oct. 24, 1955.

SN 698,274. Elkins-Ewall Rubber Co., Inc., Philadelphia, Pa. Filed Nov. 15, 1955.

**TRANSILFOAM**

For Synthetic Sponge-Like Material for Use as a Cushioning Agent.
First use Oct. 7, 1955.

SN 699,020. United Rubber & Chemical Company, Charleston, W. Va. Filed Nov. 28, 1955.

SYNTHETIC BAYTOWN RUBBER

No claim is made to the words "Synthetic Rubber" apart from the mark as shown.
For Synthetic Rubber.
First use Oct. 27, 1955.

SN 699,504. Ketchikan Pulp Company, Ketchikan, Alaska. Filed Dec. 6, 1955.

**TONGACELL**

For Cellulose Pulp in Either Bulk or Sheet Form.
First use Oct. 19, 1955.

SN 699,506. Alfred Klugmann, Inc., New York, N. Y. Filed Dec. 6, 1955.

ALKUSMAND

For Bristles and Hair Tufts.
First use September 1955.

SN 1,477. Scranton Lace Company, Scranton, Pa. Filed Jan. 25, 1956.

**LAMIPLEX**

For Sheet Materials for Laminating—Namely, Vinyl-P. V. C., Vinyl Acetate, Mylar, Cellulose Acetate, Cellulose Butyrate Acetate; and Woven Materials—Namely, Cotton, Rayon, Nylon, Fortisand, Paper, Burlap, and Woven Glass.
First use June 26, 1955.

SN 3,519. Copolymer Rubber & Chemical Corporation, Baton Rouge, La. Filed Feb. 28, 1956.

CRCC

For Bulk Synthetic Rubber.
First use Apr. 24, 1955.

SN 3,520. Copolymer Rubber & Chemical Corporation, Baton Rouge, La. Filed Feb. 28, 1956.

CRCC

For Bulk Synthetic Rubber.
First use Apr. 24, 1955.

SN 4,841. Rayonier Incorporated, New York, N. Y. Filed Mar. 19, 1956.

**GEORGIANIER**

Owner of Reg. Nos. 275,076, 311,937, and others.
For Cellulose Pulp.
First use Feb. 7, 1956.

SN 6,063. The Stamford Rubber Supply Company, Stamford, Conn. Filed Apr. 9, 1956.

**FACTEX**

Owner of Reg. No. 321,475.
For Rubber Substitutes—Namely, Vulcanized Fatty Oils and Vulcanized Fatty Acids.
First use on or before Apr. 23, 1940.

SN 6,168. Grocery Store Products Co., West Chester, Pa. Filed Apr. 11, 1956.

**GREEN HILL**

Owner of Reg. No. 538,420.
For Potting Soil.
First use Mar. 22, 1956.

SN 7,876. Superior Tanning Company, Chicago, Ill. Filed May 7, 1956.

**KAYBEE**

For Leather Made From Cattlehides and Horsehides.
First use in 1934.

SN 8,250. Superior Tanning Company, Chicago, Ill. Filed May 14, 1956.

**MAJESTIC**

For Leather Made From Cattlehides and Horsehides.
First use 1936.

SN 8,382. Wm. T. Burnett & Co., Incorporated, Baltimore, Md. Filed May 16, 1956.

COMFORT THROUGH SCIENCE

For Polyurethane Foam.
First use Nov. 19, 1954.

SN 8,566. General Reduction Company, Chicago, Ill. Filed May 18, 1956. Sec. 2(f).

**PIKES PEAK**

Owner of Reg. No. 536,157.
For Clay, Used Primarily as a Chemical Carrier, Diluent, Coagulant, Absorbent, Conditioner, Filler Material, and Bleach.
First use 1908.

## CLASS 2

### RECEPTACLES

SN 11,449. Standard Oil Company of California, San Francisco, Calif. Filed July 13, 1956.

Owner of Reg. Nos. 356,100, 533,798, and others.
For Small Boxes for Holding Invoices; Metal Containers for Chemical Compounds of High Volatility; and Fiberboard Cartons.
First use June 15, 1956, on invoice holders.

## CLASS 3

### BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

SN 12,412. Charles Doppelt & Co., Inc., Chicago, Ill. Filed July 19, 1956.

**PIC-A-PURSE**

For Wallets.
First use July 5, 1956.

## CLASS 4

### ABRASIVES AND POLISHING MATERIALS

SN 691,929. Rosina A. Byrum, d. b. a. R. J. Byrum Products, Grand Forks, N. Dak. Filed July 20, 1955.

Home Tone YOUR FURNITURE WITH WASH-GLO

For Chemical Compound, in Liquid Form, With a Fine Oil Base, Used as a Furniture Polish, for Application With a Cotton Cloth.
First use May 12, 1955.

SN 11,446. Standard Oil Company of California, San Francisco, Calif. Filed July 13, 1956.

Owner of Reg. Nos. 356,109, 533,798, and others.
For Floor Waxes.
First use May 29, 1956.

CLASS 5

SN 682,128. Columbia Cement Co. Inc., Brooklyn, N. Y. Filed Feb. 23, 1955.

**Kwikstik**

For Adhesive Foam Cements.
First use November 1951.

SN 698,299. Norton Company, Worcester, Mass. Filed Nov. 15, 1955. Sec. 2(f) as to "Norton."

**NORTON**

For Adhesives—Namely, Protein Base Adhesives, Rubber Base Adhesives, Resin Base Adhesives, and Inorganic Base Adhesives, and Adhesive Tapes.
First use on or about Apr. 17, 1954.

SN 2,815. Raybestos-Manhattan, Inc., Passaic, N. J. Filed Feb. 16, 1956.

**RAY-BOND**

Owner of Reg. No. 438,541.
For Liquid Thermo-Setting and Thermo-Plastic Adhesive Compositions and Solvent Cements, and Primers Therefor.
First use Jan. 10, 1956.

SN 12,852. Standard Oil Company of California, San Francisco, Calif. Filed Aug. 14, 1956.

Owner of Reg. Nos. 356,109, 533,798, and others.
For Adhesive Binders Used in the Manufacture of Paper and Fibreboard Products.
First use June 11, 1956.

CLASS 6

CHEMICALS AND CHEMICAL COMPOSITIONS

SN 683,418. Mutual Products Co., Minneapolis, Minn. Filed Mar. 14, 1955.

The words "Surekill Brand" are disclaimed apart from the mark. The drawing is lined for red.
For Insecticide Sprays in Liquid Form and in Dry Granular Form.
First use Mar. 2, 1955.

SN 687,799. National Lead Company, New York, N. Y. Filed May 18, 1955.

**CLARITE**

For Organic or Metallo-Organic Material for Use in Stabilization of Clear Vinyl and Vinylidene Chloride Polymers and Copolymers.
First use Feb. 6, 1953.

SN 692,139. Hidalgo Chemical Company, Tulsa, Okla. Filed July 29, 1955.

**HI-SOL**

For Chemicals of the Type Produced by the Fischer-Tropsch Synthesis, for Example, Methanol, Ethanol, Acetone, Propyl Alcohols, Butyl Alcohols, Acetic Acid, Propionic Acid, and Ethyl Acetate for Industrial Use.
First use June 16, 1955, on acetone.

SN 692,141. Hidalgo Chemical Company, Tulsa, Okla. Filed July 29, 1955.

**HIDALGO**

For Chemicals of the Type Produced by the Fischer-Tropsch Synthesis, for Example, Methanol, Ethanol, Acetone, Propyl Alcohols, Butyl Alcohols, Acetic Acid, Propionic Acid, and Ethyl Acetate for Industrial Use.
First use June 16, 1955.

SN 693,845. Guy Laboratories, Inc., Laboratories, Harrison, N. Y. Filed Aug.

**GERMATIZE**

For Sanitising Agent for Rendering Cottons, Woolens, and Textiles Sterile and To Eliminate Static Electricity in Textiles.
First use Aug. 11, 1955.

SN 694,539. Taylor Chemical Company, Aberdeen, N. C. Filed Sept. 12, 1955. Sec. 2(f).

**SUPER KILL**

Owner of Reg. No. 341,274.
For Agricultural Pesticides.
First use January 1935.

SN 694,856. Chemical Research, Inc., Detroit, Mich. Filed Sept. 19, 1955.

**FUMI-SOIL**

For Soil Fumigant Capsule.
First use May 9, 1947.

SN 694,973. Curtis-Squire, Incorporated, Minneapolis, Minn. Filed Sept. 20, 1955.

**Squire Junior**

For Germicidal Preparation for Use on Baby Diapers To Prevent Odor and Diaper Rash.
First use on or about Jan. 1, 1949.

SN 695,013. Panogen, Inc., Ringwood, Ill. Filed Sept. 20, 1955.

**PANORAM**

For Seed Disinfectant and Protectant.
First use Dec. 29, 1954.

SN 695,014. Panogen, Inc., Ringwood, Ill. Filed Sept. 20, 1955.

**PANODRIN**

For Compositions for Disinfecting and Protecting Seeds and Controlling Plant Diseases.
First use Mar. 9, 1955.

SN 695,901. E. I. du Pont de Nemours and Company, Wilmington, Del. Filed Oct. 5, 1955.

**PANALON**

Owner of Reg. No. 572,028.
For Composition Containing Resins or Polymer-Forming Materials for Use in Treating Fibrous Materials Such as Paper, Leather, or Textiles for the Purpose of Improving Their Appearance, Crease Resistance or Dimensional Stability.
First use May 20, 1955.

SN 699,338. National Starch Products Inc., New York, N. Y. Filed Dec. 2, 1955.

**CATO**

For Chemically Treated Starch, Sold in Dry Form, for Use as a Headbox or Beater Additive in the Manufacture of Paper.
First use Sept. 15, 1955.

SN 699,900. General American Transportation Corporation, Chicago, Ill. Filed Dec. 13, 1955.

**KANIGEN**

Owner of Reg. Nos. 256,044 and 612,040.
For Chemical Plating Solution.
First use Oct. 28, 1955.

SN 700,926. N. V. Hollandsche Melksuikerfabriek, Uitgeest, Netherlands. Filed Nov. 16, 1955.

**HMS**

Owner of Dutch Reg. No. 13,661, dated Apr. 17, 1899.
For Lactose, as a Chemical Product.

SN 1,678. General Aniline & Film Corporation, New York, N. Y. Filed Jan. 30, 1956.

**KATAPOL**

Owner of Reg. No. 400,253.
For Cationic Emulsifying Scouring Agent for Treatment of Textile Fiber and Emulsifying Mineral Oils.
First use Oct. 30, 1941.

SN 1,679. General Aniline & Film Corporation, New York, N. Y. Filed Jan. 30, 1956.

**KATAPONE**

Owner of Reg. No. 400,253.
For Quaternary Ammonium Chloride Compound for Inhibiting Metal Corrosion.
First use June 6, 1955.

SN 5,937. Oakite Products, Inc., New York, N. Y. Filed Apr. 6, 1956.

**RINSITE**

For Chemical Preparation To Be Used as a Final Rinse, After Cleaning, of Metal Surfaces for the Purpose of Accelerating the Dry-Down, Leaving a Water-Break Free Surface, and Preventing Water Spotting and Rapid Oxidation.
First use Jan. 10, 1956.

SN 6,007. Fred E. Hummel, d. b. a. Drilling Fluid Service and Materials, Ventura, Calif. Filed Apr. 9, 1956.

**AGUASAL**

For Drilling Fluid Additive.
First use Feb. 14, 1954.

SN 6,963. Miller Products Company, Portland, Oreg. Filed Apr. 12, 1956.

## SPRADUSTO

For Combination Foliage Insecticide-Fungicide Wettable Dust.
First use September 1945.

SN 6,749. Proxite Products, Inc., Brooklyn, N. Y. Filed Apr. 19, 1956.

## BONNIE

Owner of Reg. No. 562,280.
For Bleach, Ammonia, Plastic Starch, and Disinfectant.
First use Apr. 15, 1956, on disinfectant.

### CLASS 9

### EXPLOSIVES, FIREARMS, EQUIPMENTS, AND PROJECTILES

SN 10,432. Horning-Cooper, Incorporated, Monrovia, Calif. Filed June 18, 1956.

## WASP

For Wireless Atmospheric Sounding Projectile or Rocket.
First use Jan. 25, 1956.

SN 10,517. Cody Manufacturing Corp., Springfield, Mass. Filed June 19, 1956.

## THUNDERBIRD

For Pistols and Revolvers.
First use June 4, 1956.

### CLASS 10

### FERTILIZERS

SN 695,831. Mid-South Chemical Corporation, Memphis, Tenn. Filed Oct. 4, 1955.

The letter "N" is disclaimed apart from the mark as shown.
For Ammonia Fertilizers.
First use on or about July 16, 1955.

SN 10,863. Federal Chemical Company, Louisville, Ky. Filed June 25, 1956.

## EVER-DRILL

For Fertilizer.
First use June 13, 1956.

SN 10,897. Maxicrop Limited, Holdenby, Northampton, England. Filed June 25, 1956.

## MAXICROP

Owner of British Reg. No. 731,101, dated June 10, 1954.
For Fertilizers.

SN 11,063. The Colorado Fuel and Iron Corporation, Denver, Colo. Filed June 27, 1956.

## DAPUR

Owner of Reg. No. 626,747.
For Fertilizing Compound.
First use Apr. 15, 1955.

SN 11,064. The Colorado Fuel and Iron Corporation, Denver, Colo. Filed June 27, 1956.

## DAPAL

Owner of Reg. No. 626,747.
For Fertilizing Compound.
First use May 15, 1956.

### CLASS 11

### INKS AND INKING MATERIALS

SN 685,509. Manifold Supplies Company, New York, N. Y. Filed Apr. 15, 1955.

## BLACK PEARL

For Carbon Paper, Typewriter Ribbons, and Inked Ribbons.
First use Mar. 15, 1955.

### CLASS 12

### CONSTRUCTION MATERIALS

SN 693,642. Yetter Homes, Inc., Savannah, Ga. Filed Aug. 24, 1955.

## Jamico-Dor

For Ventilated Doors Particularly Suited for Closets.
First use May 1955.

SN 697,316. Pennington Manufacturing Company, Addison, Ill. Filed Oct. 28, 1955.

## THE CRIB THAT CORN DESIGNED

For Corn Cribs.
First use Oct. 12, 1955.

SN 697,409. Pleatwood Doors, Inc., Snohomish, Wash. Filed Oct. 31, 1955.

## PLEATWOOD

For Folding Doors and Panels.
First use Mar. 8, 1955.

SN 699,235. Ingram-Richardson Manufacturing Company, Beaver Falls, Pa. Filed Dec. 1, 1955.

## PORCELPANELS

For Insulated and Non-Insulated Panels—Namely, Porcelain Enameled Steel and/or Aluminum Panels for Exterior Wall Panels and Interior Wall Panels, Porcelain Enameled Chalkboards, Toilet Partitions, Bathroom Enclosures, Bathroom Wainscoting, and Elevator Cabs.
First use July 1954.

SN 699,503. Johns-Manville Corporation, New York, N. Y. Filed Dec. 7, 1955.

## ROCK-SHAKES

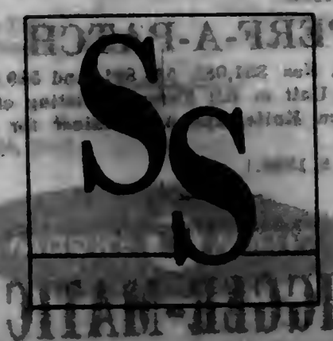
For Asbestos-Cement Shingles.
First use Oct. 28, 1955.

SN 699,723. Hannapel Door & Plywood Company, Chicago, Ill. Filed Dec. 9, 1955.

No claim is made to the wording "Approved Millwork" and "Finest Quality" apart from the mark as shown.
For Millwork.
First use Jan. 24, 1952.

SN 700,245. Michigan Moulding Company, Oak Park, Mich. Filed Dec. 19, 1955.

## SASH KING

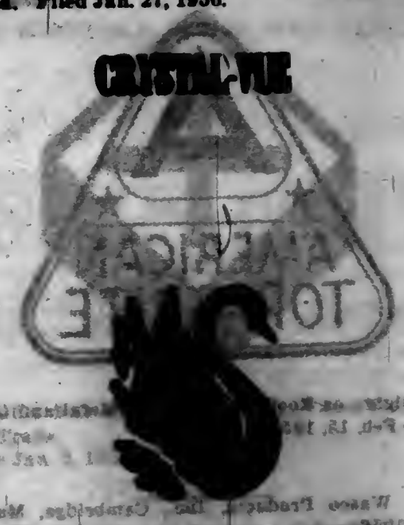


For Aluminum Weatherstrips, Moldings, Parts and Accessories for Use With Removable Window Sash.
First use Dec. 1, 1955.

SN 420. Lilco Manufacturing Company, New Cassel, N. Y. Filed Jan. 10, 1956.

## LILCO

For Aluminum Windows and Doors.
First use Dec. 10, 1955.



SN 1,517. General Plywood Corporation, Louisville, Ky. Filed Jan. 26, 1956.

For Wooden Doors for Home Building.
First use Dec. 28, 1955.

SN 1,571. Crystal-Vue Sliding Door Manufacturing Company, Miami, Fla. Filed Jan. 27, 1956.

## CRYSTAL-VUE

For Sliding Glass Doors for Enclosing Porches, Patios, Showers, Tubs, and Other Living Areas.
First use June 15, 1955.

SN 1,583. Great West Lubricants, Inc., Fort Worth, Tex. Filed Jan. 27, 1956.

## RAWHIDE

For Asbestos Roof Coating, Plastic Cement, Aluminum Fibered Roof Coating, Sealing Compound, Fly Cement, and Boiler Wall Cement.
First use Mar. 5, 1955.

SN 2,381. Wm. A. Reynolds & Co., Inc., Cleveland, Ohio. Filed Feb. 9, 1956.

## WARFLEX

Owner of Reg. No. 525,122.
For Caulking Tape.
First use Jan. 17, 1955.

SN 3,195. Samuel H. Keane, Philadelphia, Pa. Filed Feb. 23, 1956.

## WINDOW-SCOPE

For Combination Awning, Storm, Screen, and Shade Panel Windows, and Jalousie Windows and Awnings of Aluminum, Glass, and Other Materials.
First use Dec. 28, 1955.

SN 4,555. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## insul-fil

For Insulation Mixture Composed Essentially of Expanded Perlite Coated and Mixed With a High Softening Point Hydrocarbon To Enclose Conduits and the Like.
First use on or about Mar. 5, 1956.

SN 4,556. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE

For Adhesives.
First use Feb. 1, 1956.

SN 4,557. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-WELD

For Adhesives.
First use Feb. 1, 1956.

SN 4,558. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-SEAL

For Adhesives.
First use Feb. 1, 1956.

SN 4,559. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-BOND

For Adhesives.
First use Feb. 1, 1956.

SN 4,560. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-GRIP

For Adhesives.
First use Feb. 1, 1956.

SN 4,561. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-TAPE

For Adhesives.
First use Feb. 1, 1956.

SN 4,562. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-SEAM

For Adhesives.
First use Feb. 1, 1956.

SN 4,563. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-FOAM

For Adhesives.
First use Feb. 1, 1956.

SN 4,564. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-FLEX

For Adhesives.
First use Feb. 1, 1956.

SN 4,565. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-SET

For Adhesives.
First use Feb. 1, 1956.

SN 4,566. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-FIX

For Adhesives.
First use Feb. 1, 1956.

SN 4,567. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-PLASTIC

For Adhesives.
First use Feb. 1, 1956.

SN 4,568. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-PATCH

For Adhesives.
First use Feb. 1, 1956.

SN 4,569. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-GLAZE

For Adhesives.
First use Feb. 1, 1956.

SN 4,570. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-CAULK

For Adhesives.
First use Feb. 1, 1956.

SN 4,571. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-PAINT

For Adhesives.
First use Feb. 1, 1956.

SN 4,572. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-WOOD

For Adhesives.
First use Feb. 1, 1956.

SN 4,573. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-TILE

For Adhesives.
First use Feb. 1, 1956.

SN 4,574. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-CEMENT

For Adhesives.
First use Feb. 1, 1956.

SN 4,575. Miracle Adhesives Corporation, New York, N. Y. Filed Mar. 14, 1956.

## MIRACLE-MASTIC

For Adhesives.
First use Feb. 1, 1956.

SN 4,753. American 3-Way-Luxfer Prism Co., Chicago, Ill. Filed Mar. 19, 1956.

For Toplights or Roofscape Units of Metal and Glass.
First use Feb. 15, 1954.

SN 4,867. Wasco Products, Inc., Cambridge, Mass. Filed Mar. 19, 1956.

**WASCOSEAL**

Owner of Reg. Nos. 335,851 and 531,595.
For Permanent, Plastic Vapor Barrier Flashing.
First use Jan. 16, 1956.

SN 4,935. Birmingham Industries, Inc., Miami, Fla. Filed Mar. 21, 1956.

The words "Fold-Down" and "All Aluminum" are disclaimed apart from the mark as shown.
For Metal Awnings.
First use Mar. 1, 1956.

SN 5,092. Fordyce Wood Products, Inc., Fordyce, Ark. Filed Mar. 23, 1956.

**TRIM - N - ALL**

For Millwork—Namely, Jambs and Moldings.
First use at least as early as November 1955.

SN 5,093. Fordyce Wood Products, Inc., Fordyce, Ark. Filed Mar. 23, 1956.

**ROSEMARY**

For Millwork—Namely, Jambs and Moldings.
First use at least as early as November 1955.

SN 5,288. Farbenfabriken Bayer Aktiengesellschaft, Leverkusen-Bayerwerk, Germany. Filed Mar. 27, 1956.

**MOLTOPREN**

Owner of German Reg. No. 656,314, dated Apr. 14, 1954.
For Linings Formed of Foam- and Light-Artificial Substances for Acoustic and Thermal Insulation Purposes.

SN 5,305. The Celotex Corporation, Chicago, Ill. Filed Mar. 29, 1956. Sec. 2(f).

**TRIPLE SEALED**

For Saturated, Fiber Based Roofing Products—Namely, Asphalt Shingles; Asphalt Sidings; and Both Mineral Surfaced and Smooth Surfaced Roll Roofings.
First use Sept. 1, 1938.

SN 6,571. U. S. Industries, Inc., New York, N. Y. Filed Apr. 17, 1956.

For Mortar Lined and Covered Pipe and Pipe Joints.
First use Feb. 29, 1956.

SN 6,572. U. S. Industries, Inc., New York, N. Y. Filed Apr. 17, 1956.

For Mortar Lined and Covered Pipe and Pipe Joints.
First use Feb. 29, 1956.

SN 6,707. The Flintkote Company, New York, N. Y. Filed Apr. 19, 1956.

**FLINTWOOD**

For Asbestos-Cement Siding.
First use on or about May 17, 1951.

SN 6,709. The Flintkote Company, New York, N. Y. Filed Apr. 19, 1956.

**STICK-TAB**

For Caulking and Sealing Cement.
First use on or about Jan. 6, 1950.

SN 6,771. United States Gypsum Company, Chicago, Ill. Filed Apr. 19, 1956.

**PERF-A-PATCH**

Owner of Reg. Nos. 351,062, 533,891, and 599,611.
For Patching Unit in Kit Form Consisting of a Cement, Tape, Application Knife, and a Container for Mixing the Materials.
First use Mar. 8, 1955.

SN 6,807. Inventors Sales Corporation, Salt Lake City, Utah. Filed Apr. 20, 1956.

**TRIGGER-MATIC**

For Thresholds.
First use Jan. 7, 1955.

SN 11,418. Standard Oil Company of California, San Francisco, Calif. Filed July 13, 1956.

Owner of Reg. Nos. 356,109, 533,795, and others.
For Asphalt Mastic Roof Surfacing or Underlayment Compositions.
First use June 6, 1946.

SN 12,855. Standard Oil Company of California, San Francisco, Calif. Filed Aug. 14, 1956.

Owner of Reg. Nos. 356,109, 533,795, and others.
For Bituminous Construction and Surfacing Compositions—Namely, Asphalt, Asphaltic Binders, Asphaltic Emulsions, Pavement Materials, and Bituminous Compounds and Emulsions Miscible in Water.
First use June 11, 1956.

**CLASS 13**

**HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES**

SN 696,154. Manufacturers Corporation of Mansfield, Ohio, Mansfield, Ohio. Filed Oct. 26, 1955.

**COPPER-LINE**

For Plastic Pipe.
First use June 15, 1954.

SN 697,178. A. R. Moore Company, Inc., Waupaca, Wis. Filed Oct. 26, 1955.

For Gasket Door Operators.
First use June 28, 1955.

TM 712 O. G.—5

SN 706. Ekco-Alcoa Containers Inc., River Grove, Ill. Filed Jan. 16, 1956.

For Metallic Foil Products—Namely, Pans, Plates, Dishes, Cups, and Trays.
First use Jan. 3, 1956.

SN 5,020. The B & T Metals Company, Columbus, Ohio. Filed Mar. 22, 1956.

**GRIPTAC**

For Metal Edging and Binding Strips for Securing Carpets to Floors.
First use Feb. 1, 1954.

SN 8,910. Dalmine S. p. A., Milan, Italy. Filed Apr. 30, 1956.

Owner of Italian Reg. No. 99,025, dated Nov. 18, 1950.
For Metals and Metal Castings and Forgings—Namely, Tubes and Piping.

SN 8,943. Weldon C. Erwin, d. b. a. W. C. Erwin Company, Southgate, Calif. Filed May 24, 1956.

**VIBRA-SHOWER**

For Shower Head.
First use Feb. 27, 1950.

SN 10,063. Skyline Plastic Pipe, Inc., Titusville, Pa. Filed May 31, 1956.

**BI-LINE**

For Pipe and Pipe Fittings Made of Plastic Materials.
First use on or about Sept. 1, 1954.

## CLASS 14

### METALS AND METAL CASTINGS AND FORGINGS

SN 696,227. Fansteel Co. Inc., Detroit, Mich. Filed Oct. 11, 1955.

FICO

For Titanium [illegible] Particles, and Pulverized or Finely Divided [illegible] Particles for Use as a Secondary Metal in Smelting Processes.
First use Oct. 6, 1953.

## CLASS 15

### OILS AND GREASES

SN 12,194. Paul K. Horstman, d. b. a. Paul K. Horstman, Fort Wayne, Ind. Filed July 16, 1956.

Stix

For Petroleum and Synthetic Lubricants and Oleaginous Materials—Namely, Grease, Transmission Oils, and Transmission Fluid.
First use April 3, 1940.

SN 12,751. Socony Mobil Oil Company, Inc., New York, N. Y. Filed July 24, 1956.

VISREX

For Rough Machinery Lubricating Oils and Compounds.
First use at least as early as May 28, 1956.

SN 13,008. Arius Laboratories, Inc., New York, N. Y. Filed July 30, 1956.

VISAR

For Additives for Lubricating Oil, Petroleum, and Hydraulic Fluids.
First use July 21, 1952.

## CLASS 16

### PROTECTIVE AND DECORATIVE COATINGS

SN 7,685. Linmar, Inc., Cambridge, Mass. Filed May 4, 1956.

WAW-KING

For Wood Finish.
First use Apr. 2, 1956.

SN 7,974. Benjamin Foster Company, Philadelphia, Pa. Filed May 9, 1956.

INSULFAS

For Fire Retardant Insulating Coatings for Metal Surfaces.
First use Feb. 9, 1955.

SN 12,856. Standard Oil Company of California, San Francisco, Calif. Filed Aug. 14, 1956.

Owner of Reg. Nos. 356,169, 563,795, and others.
For Waterproofing and Protective Coatings for Concrete, Steel, Wood, Plaster, Masonry, and Surfaces in General, and Paint Driers.
First use June 11, 1956.

## CLASS 18

### MEDICINES AND PHARMACEUTICAL PREPARATIONS

SN 652,100. Chase Chemical Company, Newark, N. J. Filed Aug. 21, 1953.

HISTAPHEN

For Analgetic, Antipyretic, and Antiallergic Preparation for the Relief of Colds, Headaches, Allergies, and Minor Menstrual Pains.
First use December 1949.

SN 674,983. Mattox and Moore, Inc., Indianapolis, Ind. Filed Oct. 18, 1954.

M & M 511

For Veterinary Composition Containing Procaine Penicillin-G and Dihydrostreptomycin.
First use Mar. 9, 1954.

SN 682,172. National Drug Distributors, Mineola, N. Y. Filed Feb. 23, 1955.

For Vitamins, Hormones, and Pharmaceutical Preparations for Use Orally, Locally, or by Means of Injection, and Sterile Sponges, Hypodermic Syringes, and Hypodermic Needles.
First use May 4, 1954.

SN 534. C. H. Boehringer Sohn, Ingelheim am Rhein, Germany. Filed Jan. 12, 1956.

VALMORIN

Owner of German Reg. No. 684,888, dated Oct. 29, 1954.
For Sedative and Hypnotic Preparations.

SN 535. C. H. Boehringer Sohn, Ingelheim am Rhein, Germany. Filed Jan. 12, 1956.

VEGETOPAN

Owner of German Reg. No. 683,970, dated Feb. 6, 1954.
For Preparation for the Treatment of Autonomic Nervous (Vegetative) Dystonia.

SN 1,411. Dr. Karl Thomae GMBH, Biberach an der Riss, Germany. Filed Jan. 24, 1956.

BELCALOID

Owner of German Reg. No. 674,739, dated Apr. 29, 1955.
For Medicinal Preparation for the Treatment of Autonomic Nervous Dystonia.

SN 2,482. Alex B. Del Buono, d. b. a. Dell & Holtz, Plainfield, N. J. Filed Feb. 2, 1956.

SAGAR

For Medicated Ointment for Skin Irritations, Itching, Chafing, and Burns.
First use May 1, 1955.

SN 5,663. Chas. Pfizer & Co., Inc., Brooklyn, N. Y. Filed Apr. 5, 1956.

TERRA-STREP

Owner of Reg. No. 585,114.
For Antibiotic Preparation.
First use Mar. 23, 1956.

SN 6,269. Louis A. Paparelli, d. b. a. San Antonio Drug Store, Albuquerque, N. Mex. Filed Apr. 13, 1956.

LINIMENTO VOLATICO

The word "Liniments" is the Spanish word for "Liniment" and such is disclaimed apart from the mark as shown. "Volatico" is a coined Spanish word and has no English translation.
For Liniment for the Relief of Muscular Aches and Pains Resulting From Over-Exertion and Fatigue.
First use in October 1952.

SN 7,042. Schenley Laboratories, Inc., New York, N. Y. Filed Apr. 24, 1956.

Rutaminal-RQ

Owner of Reg. Nos. 509,933 and 512,405.
For Cardio-Vascular Adjuvant.
First use Dec. 27, 1955.

SN 7,460. Bristol Laboratories Inc., New York, N. Y. Filed May 2, 1956.

DIASEPT

For Antibiotic Pharmaceutical Preparation.
First use Dec. 20, 1955.

SN 7,521. Arthur H. Meyerhoff, d. b. a. Tryzol Products Company, Chicago, Ill. Filed May 3, 1956.

TRYZOL

For Preparation Used for Warming Poultry and Animals.
First use Mar. 15, 1956.

## CLASS 19

### VEHICLES

SN 4,564. Phil's Way, Inc., Youngstown, Ohio. Filed Mar. 14, 1956.

SAFTRAC

The drawing is lined to indicate the color red, although the mark is not limited to such color.
For Vehicles—Namely, Tractor Drawn Trailers for Hauling Freight.
First use in or about January 1947.

SN 4,565. Phil's Way, Inc., Youngstown, Ohio. Filed Mar. 14, 1956.

PHILS-WAY

For Vehicles—Namely, Tractor Drawn Trailers for Hauling Freight.
First use in or about January 1947.

SN 6,457. North American Aviation, Inc., Los Angeles, Calif. Filed Apr. 16, 1956.

Navaho

The drawing is lined for red and gray.
For Unmanned Aircraft.
First use Apr. 7, 1956.

SN 8,193. Coachcraft, Ltd., Hollywood, Calif. Filed May 14, 1956.

COACHCRAFT

Owner of Reg. No. 616,116.
For Non-Electrical Automobile Accessories, and Particularly: Headrests for Automobile Seats, Reclining-Type Hardware for Automobile Seats, Top of Car Luggage Carriers, and Spare Wheel Assemblies (Continental Kits).
First use August 1948 on top of car luggage carriers.

SN 8,194. Coachcraft, Ltd., Hollywood, Calif. Filed May 14, 1956.

Coachcraft

The drawing is lined for blue, but the mark is not limited as to color. Owner of Reg. No. 616,116.
For Non-Electrical Automobile Accessories, and Particularly: Headrests for Automobile Seats, Reclining-Type Hard-

ware for Automobile Seats, Top of Car Luggage Carriers, and Spare Wheel Assemblies (Continental Kits).
First use January 1956.

SN 8,257. The Neilson Wheel Company, Milwaukee, Wis. Filed May 14, 1956.

CRACKER BOX DERBY

For Vehicle Wheels and Wheel Mounting Brackets and Axles.
First use on or about Apr. 13, 1956, on wheel kits comprising wheels, mounting brackets, and axles.

## CLASS 21

## ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

SN 677,984. Radeico Manufacturing Company, Cleveland, Ohio. Filed Dec. 8, 1954.

DRAGNET

For Television Antennas.
First use June 24, 1954.

SN 692,959. Sparks-Withington Company, Jackson, Mich. Filed Aug. 12, 1955.

SPARTON COLORMATIC

For Television Receivers.
First use May 16, 1955.

SN 4,328. International Business Machines Corporation, New York, N. Y. Filed Mar. 12, 1956.

IBM

Owner of Reg. Nos. 529,943, 616,548, and others.
For Magnetic Recording Tape, Tape Reels, Tape Reel Containers, Magnetic Tape Markers, Magnetic Tape File Protection Rings.
First use Aug. 5, 1955.

SN 5,500. Happ Corporation, Detroit, Mich. Filed Mar. 27, 1956. Sec. 2(f).

Perfection

The drawing is lined for red. Owner of Reg. Nos. 618,223, 184,730, and 184,706.
For Electric Ranges, Electric Water Heaters, and Electric Radiant Heaters.
First use on or about July 28, 1914.

SN 6,684. Avco Manufacturing Corporation, Connersville, Ind. Filed Apr. 19, 1956.

For Electrically Operated Garbage Disposers and Electrically Operated Dishwashers.
First use Jan. 26, 1956.

SN 6,701. Duro-Test Corporation, North Bergen, N. J. Filed Apr. 19, 1956.

VIS-A-RAY

The word "Ray" is disclaimed apart from the mark as shown. Owner of Reg. No. 535,209.
For Incandescent and Fluorescent Lamps.
First use Apr. 27, 1948.

SN 6,880. Waikiki Equipment Company, Honolulu, Territory of Hawaii. Filed Apr. 20, 1956.

FATHOMLITE

For Waterproof Flashlight Covers.
First use Oct. 28, 1955.

SN 6,976. Acra Electric Corporation, Franklin Park, Ill. Filed Apr. 24, 1956.

ACRAWATT

For Electric Heating Elements.
First use Apr. 19, 1940.

SN 6,982. Chas. D. Briddell, Inc., Crisfield, Md. Filed Apr. 24, 1956.

Carvel Hall

Owner of Reg. Nos. 521,685, 619,459, and 632,659.
For Electric Knife Sharpeners.
First use January 1955.

SN 6,986. Cornell-Dubilier Electric Corporation, South Plainfield, N. J. Filed Apr. 24, 1956.

DYKANOL

For Electrical Condensers.
First use Apr. 19, 1935.

SN 6,987. Cornell-Dubilier Electric Corporation, South Plainfield, N. J. Filed Apr. 24, 1956.

BEAVER

For Electrolytic Condensers.
First use Jan. 17, 1938.

SN 6,988. Cornell-Dubilier Electric Corporation, South Plainfield, N. J. Filed Apr. 24, 1956.

SERVICE-MIKE

For Electrolytic Condensers.
First use Sept. 28, 1939.

SN 7,149. Ark-Les Switch Corporation, Watertown, Mass. Filed Apr. 26, 1956. Sec. 2(f).

ARK-LES

Owner of Reg. No. 507,640.
For Terminals of Metal and Terminal Boards of Metal and Plastic.
First use May 1, 1950.

SN 7,180. Duro-Test Corporation, North Bergen, N. J. Filed Apr. 26, 1956.

ARC-ESCENT

For Electric Lamps.
First use Apr. 4, 1956.

SN 7,188. In-Sink-Erator Manufacturing Company, Racine, Wis. Filed Apr. 26, 1956.

Garb-away

For Garbage Disposal Units.
First use Mar. 21, 1956.

SN 7,482. Brumberger Co. Inc., Brooklyn, N. Y. Filed May 2, 1956.

Selectro-Com

For Electronic Inter-Communication Systems.
First use Mar. 1, 1956.

SN 7,636. Signal-Stat Corporation, Brooklyn, N. Y. Filed May 3, 1956.

CYCLOSTAT

For Directional Signal Lamps and Clearance Lamps, and Parts Thereof.
First use Oct. 7, 1955.

SN 7,825. Oakton Engineering Corporation, Evanston, Ill. Filed May 7, 1956.

robotape

For Automatically Operated Tape Reproducer and Controlling Device.
First use Feb. 9, 1956.

SN 7,838. Philco Corporation, Philadelphia, Pa. Filed May 7, 1956.

Audipage

For Magnetic Paging Apparatus.
First use Apr. 11, 1956.

SN 8,074. Chris P. Hoefer, d. b. a. J. D. D. Lubricants Company, Sioux City, Iowa. Filed May 10, 1956.

J-D-D

The lining on the drawing designates the color green.
Owner of Reg. No. 440,026.
For Storage Batteries.
First use July 1, 1952.

SN 8,393. Electro Silv-A-Ring Corporation, Chicago, Ill. Filed May 16, 1956.

POLYCUBE

For Plastic Louver for Lighting Fixtures.
First use Jan. 1, 1955.

SN 8,433. Ohmite Manufacturing Company, Skokie, Ill. Filed May 16, 1956.

"TAN-O-MITE"

For Capacitors.
First use Feb. 1, 1956.

SN 8,852. Infra Electronic Corporation, Roseland, N. J. Filed May 23, 1956.

DIRECTOR

For Dictation Machines.
First use Apr. 19, 1956.
Subj. to Intf. with SN 9,065.

SN 8,912. Allis-Chalmers Manufacturing Company, Milwaukee, Wis. Filed May 24, 1956.

SYNDUCTION

For Electric Motors.
First use Sept. 20, 1954.

SN 9,047. Multnomah Battery Manufacturing Co., Portland, Oreg. Filed May 25, 1956.

MULTNOMAH Quality BATTERIES

The drawing is lined to indicate the color yellow. The words "Quality" and "Batteries" are disclaimed from the mark as shown.
For Electric Batteries.
First use Jan. 2, 1956.

SN 9,055. Roto-Chef, Inc., Dallas, Tex. Filed May 25, 1956.

Roto-Chef

For Electric Barbecue Grills.
First use Mar. 20, 1956.

SN 9,056. Royal Electric, Inc., Xenia, Ohio. Filed May 25, 1956.

ROTOSOL

For Solenoid Motors.
First use May 2, 1956.

SN 9,317. Edwin L. Wiegand Company, Pittsburgh, Pa. Filed May 29, 1956.

THE NAME IN ELECTRIC HEAT

The drawing is lined for the color red, but it is not intended that the mark be limited to any color. Owner of Reg. No. 246,652.
For Electric Heating Apparatus and Parts Thereof.
First use Feb. 1, 1956.

SN 9,368. Littelfuse, Inc., Des Plaines, Ill. Filed May 31, 1956. Sec. 2(f).

SLO-BLO

For Time Delay Fuses.
First use 1938.

## CLASS 22

## GAMES, TOYS, AND SPORTING GOODS

SN 7,469. John C. Backe, Gaylord, Mich. Filed May 2, 1956.

SONIZED ACTION

For Fish Lure.
First use May 1, 1956.

SN 7,683. Johnson-Machulda, Fergus Falls, Minn. Filed May 4, 1956.

SKIM

For Game Including Pins and Striker.
First use Apr. 19, 1956.

SN 7,793. Globe Rubber Products Corp., Philadelphia, Pa. Filed May 7, 1956.

SEA DRAGON

For Swimming Accessories—Namely, Goggles, Masks, Snorkel Masks, Swim Fins, Snorkels, Ear Plugs and Nose Clips; and Beach Games—Namely, Horseshoe Sets.
First use Apr. 16, 1956.

SN 7,883. Universal Bowling & Golf Corporation, Chicago, Ill. Filed May 7, 1956.

CHARMED CIRCLE

For Golf Balls.
First use on or about Oct. 31, 1955.

SN 7,884. Universal Bowling & Golf Corporation, Chicago, Ill. Filed May 7, 1956.

WORTHMORE

For Golf Balls.
First use on or about Oct. 31, 1955.

SN 7,949. Sears, Roebuck and Co., Chicago, Ill. Filed May 8, 1956.

SPIN-HED

For Fishing Lines.
First use on or about Jan. 2, 1955.

SN 8,052. Burke Golf Equipment Corporation, Newark, Ohio. Filed May 10, 1956.

THUNDERBIRD

For Golf Clubs.
First use Apr. 18, 1956.
Subj. to Intf. with SN 9,575.

SN 8,101. Viking Sports Products, Inc., Westwood, N. J. Filed May 10, 1956.

Flite-n-Float

For Golf Balls.
First use May 2, 1955.

## CLASS 23

## CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

SN 681,898. John Ahlin and Sons, Incorporated, Bridgeport, Conn. Filed Feb. 18, 1955.

"KIDDYKUT"

For Scissors.
First use Nov. 29, 1954.

SN 682,577. Zip Products Co., Los Altos, Calif. Filed Mar. 1, 1955.

Zip

Owner of Reg. No. 526,101.
For Staple Removers.
First use December 1952.

SN 690,094. The Foley-Irish Corporation, Brooklyn, N. Y. Filed July 5, 1955. Sec. 2(f).

The words "Silver Washer & Drier" are disclaimed apart from the mark as shown. Owner of Reg. No. 525,818.
For Washing Machines for Silverware.
First use June 1, 1937.

SN 691,843. Durex Hardware Manufacturing Corp., New York, N. Y. Filed July 25, 1955.

durex

For Wrenches, Trowels, Pliers, Ratchet Braces, Glass Cutters, Screwdrivers, Pruning Shears, Files, Hammers, Reamers, Steel Tapes, Rulers, Levels, Planes, Vises, Nutdrivers, and Saws.
First use Sept. 22, 1953.

SN 695,461. J. Wiss & Sons Co., Newark, N. J. Filed Sept. 27, 1955.

METALMASTER

For Compound Action Snips, Aviation Type.
First use February 1936.

SN 696,823. Leeder Manufacturing Co., Inc., Keyport, N. J. Filed Oct. 4, 1955.

LEEDER

For Fire Extinguishers.
First use July 24, 1953.

SN 699,471. Bristol Repetition Limited, Bristol, England. Filed Dec. 6, 1955.

COMPASS

Owner of British Reg. No. 732,346, dated July 20, 1954.
For Lathes, Capstan and Turret Lathes, Automatic Lathes (Horizontal and Vertical), Milling Machines, Boring Machines, Drilling Machines, Tapping Machines, Grinding Machines of All Classes, Multi-Operation Machines, Other Special Purpose Machines, Machines and Machine-Tools for Automation Processes.

SN 1,142. Gelis Bentolila, Paris, France. Filed Jan. 20, 1956.

DYNAMATIC

Owner of French Reg. No. 451,249, dated May 27, 1955 (Seine); Natl. Inst. No. 57,470.
For Hand Knitting Machines.

SN 1,380. Midland Products Co., Midland Park, N. J. Filed Jan. 24, 1956.

IRONMASTER

For Machines for Bending and Cutting Metallic Rods, Bars, and Pipes.
First use Mar. 28, 1955.

SN 1,722. Reed Roller Bit Company, Houston, Tex. Filed Jan. 30, 1956.

R

For Roller Type Earth Drilling Bits; Scrape Type Earth Drilling Bits; Bit Break Out Plates for Receiving and Holding Earth Drilling Bits While Connecting and Disconnecting Them From Drill Stems; Steel Facing for Earth Drilling Bits; Earth Drilling Core Bits and Wire Line Retractable Core Barrels Therefor, Both Protruding and Non-Protruding Types; Drill Collars; Drilling Substitutes Such as Threaded Coupling Joints or Members; Earth Bore Hole Reamers; Earth Drilling Pilot Bits; Earth Drilling Core Bits and Non-Retractable Core Barrels for Use Therewith; Earth Drilling Basket Bits Adapted To Trap and Remove Lost Non-Drillable Parts From an Earth Bore Hole; and Parts Therefor.
First use 1927.

SN 3,109. Minnesota Mining and Manufacturing Company, St. Paul, Minn. Filed Feb. 21, 1956.

3M BRAND

For Machine for Treating Moldy Material Used in Printing.
First use Mar. 28, 1955.

SN 3,928. Archie W. Beeman, d. b. a. Eagle Claw Tool Company, Odessa, Tex. Filed Mar. 6, 1956.

EAGLE CLAW

For Well Drilling Tong Dies.
First use Mar. 20, 1955.

SN 5,146. Allen Electric and Equipment Company, Kalamazoo, Mich. Filed Mar. 26, 1956.

ADJUST-A-KIT

For Tool Kit Comprising Hand Tools for Servicing and Adjusting Distributors and Regulators of Internal Combustion Engines and for Setting Spark Plug Gaps.
First use Mar. 5, 1956.

SN 5,374. Allen Electric and Equipment Company, Kalamazoo, Mich. Filed Mar. 29, 1956.

ARMTRU

For Lathe for Servicing Automotive Electrical Equipment.
First use Mar. 7, 1956.

SN 5,474. Vaill Brothers Corporation, Chicago, Ill. Filed Mar. 29, 1956.

E-Z 45

Owner of Reg. No. 613,050.
For Detachable Blade Barber Shears.
First use Aug. 1, 1955.

SN 5,584. Bingham Brothers Company, New York, N. Y. Filed Apr. 2, 1956.

NU-CLEAR

For Printers' and Lithographers' Rollers.
First use Feb. 16, 1956.

SN 7,600. International Standard Trading Corporation, New York, N. Y.

For Pneumatic Tube Dispatch Systems and Accessories Therefor.
First use Jan. 8, 1953.

SN 7,819. J. Curry Mendes Corp., Canton, Mass. Filed May 7, 1956.

FORM KING

For Collators.
First use Oct. 16, 1955.

SN 8,133. Huesmann Refrigerator Co., St. Louis, Mo. Filed May 11, 1956.

AUTO-FLO

For Automatic Checkout Devices for Stores, Especially Food Stores.
First use Apr. 20, 1956.

SN 8,511. Spencer-Kennedy Laboratories, Inc., Boston, Mass. Filed May 17, 1956.

SKL

For Radio and Television Equipment and Parts Thereof.
First use Jan. 31, 1956.

SN 8,630. Choker Machinery Corporation, Philadelphia, Pa. Filed May 21, 1956.

CHOKER

For Apparatus for Restricting the Vascular Tract of a Ham or the Like Preliminarily to Injecting the Same With Curing Liquid.
First use in November 1955.

SN 8,676. Manex Machinery Corporation, New York, N. Y. Filed May 21, 1956.

MANEX

For Machine Tools—Namely, High Speed Electrical Vertical Milling Machines and Rotary Milling Tables and Parts and Accessories Therefor.
First use on or about June 1, 1952, on high speed vertical milling machines.

SN 8,782. Gertrude Lee, d. b. a. Lee Products Company, Carl Junction, Mo. Filed May 22, 1956.

Ranchmaster

For Power-Driven Lawnmowers and Small Tractors.
First use Mar. 12, 1956.

SN 4,822. Coal Bit Company, Prestonsburg, Ky. Filed May 23, 1956.

HILLBILLY BITS

For Coal Cutting Machine Bits.
First use July 15, 1955.

SN 9,065. Underwood Corporation, New York, N. Y. Filed May 25, 1956.

DIRECTOR

For Typewriters and Parts Thereof.
First use Apr. 9, 1956.
Subj. to Intf. with SN 8,868.

SN 9,146. Hill Novelties Mfg. Corp., New York, N. Y. Filed May 28, 1956.

TIDAX JUPITER

For Knives, Pocket Knives, Combination Knife and Screw Driver.
First use January 1956.

SN 11,452. Standard Oil Company of California, San Francisco, Calif. Filed July 18, 1956.

Owner of Reg. Nos. 564,109, 630,265, and others.
For Embossing and Printing Machines and Auxiliary Devices for Introducing a Priming Fuel, Other Than the Normal Running Engine Fuel, Into Internal Combustion Engines.
First use June 2, 1950, on auxiliary devices.

CLASS 26

MEASURING AND SCIENTIFIC APPLIANCES

SN 636,314. Jarrell-Ash Company, Newtonville, Mass. Filed Apr. 26, 1955.

OY-OY ARITHMOMETER

For Instrument for Counting Blood Cells.
First use Feb. 28, 1955.

SN 688,889. Avia[illegible] Woodside, N. Y. Filed June 6, 1955.

For Voltage Reference Sources.
First use Mar. 30, 1955.

SN 691,127. The General Fireproofing Company, Youngstown, Ohio. Filed July 12, 1955.

Draftamatic

Owner of Reg. No. 216,941.
For Drafting Tables.
First use May 2, 1955.

SN 692,919. George H. Gardiner, Brooklyn, N. Y. Filed Aug. 12, 1955.

STA FAST

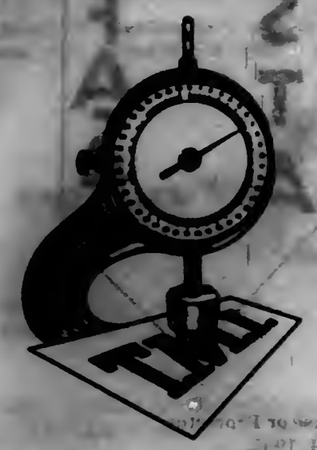
For Eyeglass Case or Protector.
First use May 14, 1955.

SN 694,642. Davenport Manufacturing Co., Chicago, Ill. Filed Sept. 14, 1955.

For High-Voltage Electrical Testing Equipment, Resistance-Measurement Instruments, Laboratory-Standard Electrical Metering Instruments, A.-C. Current Transformers, and Energy-Discharge Lighting Equipment for Photography.
First use Aug. 25, 1955.

SN 700,395. Universum-Film A. G., Berlin-Tempelhof, Germany. Filed Dec. 21, 1955.

UNIVERSUM



Owner of German Reg. No. 321,035, dated Apr. 15, 1919.
For Cinematographical Goods, Devices and Apparatus and Parts of the Apparatus, Projection Apparatus and Projection Screens, Unexposed Films and Plates, Photographic Apparatus and Unexposed Photographic Papers and Photographic Plates, and Photographic Utensils.

SN 709,266. Universum-Film Akt.-Ges., Berlin-Tempelhof, Germany. Filed Dec. 21, 1955.

Owner of German Reg. No. 322,767, dated Oct. 20, 1924.
For Cinematographs and Parts Thereof, Projection Apparatus, Projection Screens, and Unexposed Films and Plates.

SN 925. Testing Machines, Inc., New York, N. Y. Filed Jan. 17, 1956.

No claim is made to the representation of the goods apart from the mark as shown.
For Precision Testing and Measuring Machines and Instruments for Testing and Measuring Paper, Textiles, Metals, Plastics, Rubber, and Other Materials.
First use October 1951.

SN 1,889. Motometer, M. G., Stuttgart, Germany. Filed Feb. 1, 1956.

MOTEST

For Recording Compression Testers for Testing Pressures in Engine Cylinders.
First use on or about Feb. 1, 1954.

SN 2,832. Telefonbau und Normalzeit G. m. b. H., Frankfurt am Main, Germany. Filed Feb. 16, 1956.

POSTALIA

For Postage Meters and Postal Metering Machines.
First use Apr. 9, 1940.

SN 3,910. Carl Zeiss, Oberkochen, Wurttemberg, Germany. Filed Mar. 5, 1956.

Kipronar

Owner of German Reg. No. 429,281, dated Feb. 16, 1951.
For Optical Instruments and Their Component Parts—Namely, Projection Apparatus and Objectives.

SN 3,911. Carl Zeiss, Oberkochen, Wurttemberg, Germany. Filed Mar. 5, 1956.

Hypar

Owner of German Reg. No. 842,686, dated Aug. 14, 1953.
For Optical Systems for Photographic Cameras, Reproduction Cameras and Equipment Used in Connection Therewith.

SN 4,413. American Safety Razor Corporation, New York, N. Y. Filed Mar. 13, 1956.

SHARPOMETER

For Blade Testing Device.
First use on or about Dec. 23, 1955.

SN 4,789. Electrodata Corporation, Pasadena, Calif. Filed Mar. 19, 1956.

DATATRON

For Electronic Data Processing Machines.
First use Dec. 21, 1954.

SN 6,058. Societe Industrielle de Lunetterie, Paris, France. Filed Apr. 9, 1956.

GRAND PRIX

Priority claimed under Sec. 44(d) on French Reg. No. 454,552, dated Dec. 15, 1955 (Seine); Natl. Inst. No. 65,831.
For Spectacles—Namely, Eye Glasses, Sun Glasses, Frames for Spectacles Made of Metal, Plastic, and Other Suitable Substances, and Combined Frames for Spectacles, Lenses for Spectacles.

SN 6,059. Societe Industrielle de Lunetterie, Paris, France. Filed Apr. 9, 1956.

SORBONNE

Priority claimed under Sec. 44(d) on French Reg. No. 453,597, dated Oct. 28, 1955 (Seine); Natl. Inst. No. 63,679.
For Spectacles—Namely, Eye Glasses, Sun Glasses, Frames for Spectacles Made of Metal, Plastic, and Other Suitable Substances, and Combined Frames for Spectacles, Lenses for Spectacles.

SN 6,426. Helipot Corporation, South Pasadena, Calif. Filed Apr. 16, 1956.

YO-YO

For Potentiometers.
First use Feb. 29, 1956.

SN 6,549. Peerless Camera Stores, Inc., New York, N. Y. Filed Apr. 17, 1956.

For Strobescopic Apparatus for Photographic Purposes and Parts Thereof.
First use Dec. 27, 1955.

SN 12,855. Standard Oil Company of California, San Francisco, Calif. Filed Aug. 14, 1956.

Owner of Reg. Nos. 354,109, 533,798, and others.
For Instrument for Measuring Odor in Gas.
First use Aug. 1, 1956.

SN 13,503. Wollensak Optical Company, Rochester, N. Y. Filed Aug. 28, 1956.

FASTAIR

Owner of Reg. Nos. 402,334 and 532,841.
For Photographic Cameras and Parts Thereof.
First use on or about Aug. 17, 1956.

CLASS 28

JEWELRY AND PRECIOUS-METAL WARE

SN 695,265. Axel Bros., Inc., Long Island City, N. Y. Filed Sept. 26, 1955.

Columbia

Owner of Reg. No. 676,457.
For Finger Rings.
First use January 1932.
Subj. to Inst. with Reg. No. 617,828.

SN 9,445. Coro Inc., New York, N. Y. Filed June 1, 1956.

"QUIK-TRIK"

For Earrings.
First use May 22, 1956.

CLASS 31

FILTERS AND REFRIGERATORS

SN 671. Faraday Engineering Company, York, Pa. Filed Jan. 13, 1956.

FARAVAC

For Filters.
First use July 28, 1955.

SN 1,143. Borg-Warner Corporation, Chicago, Ill. Filed Jan. 20, 1956.

FOOD-STOR

The word "Food" is disclaimed apart from the mark as shown.
For Refrigerators and Parts Thereof for Replacement and Repair.
First use Oct. 30, 1955.

SN 1,149. Borg-Warner Corporation, Chicago, Ill. Filed Jan. 20, 1956.

Tri-Level

For Refrigerators and Parts Thereof for Replacement and Repair.
First use Oct. 30, 1955.

SN 3,680. Marquette Appliances, Inc., Minneapolis, Minn. Filed May 21, 1956.

MARQUETTE

Owner of Reg. No. 426,892.
For Freezer Machinery and Cabinets, Refrigerators, and Water Coolers.
First use April 1945.

SN 8,893. Dole Refrigerating Company, Chicago, Ill. Filed May 22, 1956.

FREZE-CEL

For Refrigeration Units.
First use Dec. 28, 1955.

CLASS 32

FURNITURE AND UPHOLSTERY

SN 640,269. Decorative Cabinet Corp., New York, N. Y. Filed May 4, 1953.

E-Z-DO

For Furniture—Namely, Cabinets, Wardrobes, Chests, Trays, Table Tops, Collapsible Tables, Folding Floor Screens.

# PATENTS

## NOTICES

### Adjudicated Patents

(D. C. Wis.) Tautz Patent No. 2,040,718 (143—132), for a trunnion. Claims 1 to 4, 10, and 11 *Held* invalid and not infringed. *Rockwell Manufacturing Company* v. *Yates-American Machine Company*, 143 F. Supp. 96; 110 USPQ 188.

(D. C. N. Y.) Drew Patent No. 2,177,627 (117—72), for adhesive sheets having a backing with a nonfibrous surface and a coating of normally tacky and pressure-sensitive adhesive united thereto, *Held* valid and infringed. *Technical Tape Corporation* v. *Minnesota Mining and Manufacturing Company*, 143 F. Supp. 429; — USPQ —.

(D. C. N. C.) Dewees Patent No. 2,322,350 (8—137), for a process for reconditioning yarn cones. Claims 1 and 5 *Held* invalid and not infringed. *Alvin G. Dewees* v. *George L. Whisenant, doing business as Whisenant Cone Company*, 142 F. Supp. 205; — USPQ —.

(C. A. Mo.) Steffan Patent No. 2,538,925 (189—46), for a door jamb. Claim 2 *Held* not infringed. *Steffan et al.* v. *Len A. Maune Company et al.*, 234 F.2d 750; 110 USPQ 7.

(D. C. Ind.) Krisman Patent No. 2,628,796 (248—43), for an antenna mounting base, *Held* valid but not infringed. *Krisman* v. *Bouchard, doing business as Radio Distributing Company et al.*, 142 F. Supp. 269; 110 USPQ 111.

(C. A. Mo.) Steffan Patent No. 2,661,084 (189—46), for a door frame. Claim 4 *Held* invalid. *Steffan et al.* v. *Len A. Maune Company et al.*, 234 F.2d 750; 110 USPQ 7.

(D. C. N. J.) Porter Patent No. 2,668,328 (18—58), for a method of casting patterned plastic sheets, *Held* invalid. *U. S. Chemical Corporation et al.* v. *Plastic Glass Corporation*, 142 F. Supp. 840; 110 USPQ 18.

(D. C. N. J.) Cusick Patent No. 2,698,009 (66—169), for a fluted fabric and method of making the same, *Held* invalid. *Vanity Fair Mills, Inc.* v. *Cusick et al.*, 143 F. Supp. 452; 110 USPQ 222.

(D. C. N. Y.) Gould Design Patent No. 164,922 (D92—1), for a textile fabric, *Held* invalid. *Trojan Textile Corp.* v. *Crown Fabrics Corp.*, 143 F. Supp. 48; 110 USPQ 231.

(D. C. N. Y.) Peck Design Patent No. 174,054 (D20—2), for an ornamental design for a panty girdle, *Held* invalid. *The H. W. Gossard Co. et al.* v. *The Nestform Co., Inc., et al.*, 143 F. Supp. 139; — USPQ —.

### Adverse Decisions in Interferences

In the designated interferences involving the indicated claims of the following patents final decisions have been rendered that the respective patentees were not the first inventors with respect to the claims listed.

Pat. 2,596,920, W. M. Smith, W. D. Luening, and S. C. Lane, Synthesis of oxygenated organic compounds, decided June 21, 1956, Interference No. 87,118, claims 16 and 19.

Pat. 2,606,826, L. Jacolev and L. P. Gaucher, Conversion of hydrocarbonaceous material into synthesis gas, decided July 11, 1956, Interference No. 87,197, claim 5.

Pat. 2,621,238, W. Palmer, Phase shift timer, decided Oct. 19, 1956, Interference No. 87,146, claims 1, 3, and 6.

Pat. 2,621,704, N. Langer, Heat sealing device, decided May 28, 1956, Interference No. 87,250, claims 3, 4, 5, 10, and 11.

Pat. 2,636,001, G. V. Browning and G. M. Webb, Grease preparation, decided Oct. 12, 1956, Interference No. 87,785, claims 1, 2, 3, 4, 5, 7, 8, 9, 10, 12, 16, and 17.

Pat. 2,648,804, O. L. Steigerwalt, H. I. Oshry, Multiple element circuit components, decided June 15, 1956, Interference No. 87,134, claim 1.

Pat. 2,668,140, K. G. Arabian, Preparation of paraffin waxes, decided Oct. 17, 1956, Interference No. 87,588, claims 1 and 2.

Pat. 2,691,940, F. R. McFarland, Transmission, decided Oct. 17, 1956, Interference No. 87,780, claim 1.

### Disclaimer

2,684,398.—*Kenith G. Strunk*, East Orange, N. J. CONDUIT FERRULE. Patent dated July 20, 1954. Disclaimer filed Oct. 26, 1956, by the inventor; the assignee, *Breese Corporations, Inc.*, consenting.

Hereby enters this disclaimer to claims 3 and 4 of said patent.

### Classification Order No. 265

The following transfers are hereby ordered to take effect on Thursday, November 1, 1956:

From Division 60 to Division 31
Class 260, Chemistry, Carbon Compounds, Subs. 80 through 94.9
From Division 50 to Division 60
Class 260, Chemistry, Carbon Compounds, Subs. 18 through 27

M. C. ROSA,
Oct. 30, 1956. *Director, Patent Examining Operation.*

### Patents Available for Licensing or Sale

2,712,896. Centrifugal Separating Device. Luigi Boldrin, 8 Via M. Giustiniani—Marghera, Venice, Italy. Correspondence to Michael S. Striker, 511 Fifth Ave., New York 17, N. Y.

2,749,698. Ring Traveller (Made of a Laminated Formaldehyd Condensation Product). Joh. Jacob Rieter & Co. Ltd., Winterthur, Switzerland.

2,750,773. Thread-Feeding Attachment for Knitting Frames. Paul Virchaux, Vigner 3, Saint-Blaise, Switzerland.

2,760,514. Ash Tray With Extinguisher. Roy C. Guthrie, 1737 S. Barrington, Los Angeles, Calif.

### New Applications Received During September 1956

| | |
|---|---|
| Patents | 5,343 |
| Designs | 336 |
| Plants | 11 |
| Reissues | 10 |
| Total | 5,700 |

### Issue

| | | | |
|---|---|---|---|
| Patents | 804 | No. 2,770,804 to No. | 2,771,607, incl. |
| Designs | 43 | No. 179,233 to No. | 179,275, incl. |
| Plants | 2 | No. 1,528 to No. | 1,529, incl. |
| Reissues | 1 | No. 24,239 | |
| Total | 850 | | |

## CONDITION OF PATENT APPLICATIONS AS OF SEPTEMBER 28, 1956

2,709,526. De-Sheller for Hard Boiled Eggs. P. J. Peritano, 42 Stephenson St., West Seneca 24, N. Y., and J. Palmieri, 116 Woodside Ave., Buffalo, N. Y.

2,766,070. Automatic Water Sprinkler Control Valve. Alexander C. Park, 2224 Eastern Ave., Sacramento 21, Calif.

2,766,077. Adjustable Railroad Journal Bearing Liner. Walter J. Walstad, 821 West 2nd St., Flint 3, Mich.

Design Pat. 178,868. Snow Scoop. C. H. Cook, 726 Crestview Drive, Youngstown 12, Ohio.

---

Arnold Silverman offers the following two patents. Inquiries concerning the patents should be directed to Arnold Silverman, 222 East 56th St., New York, N. Y.

2,540,644. Device for Mixing Materials.

2,712,316. Cigarette Ejector Holder.

---

### Patents Removed From Register

The following three patents are hereby withdrawn from the Register of Patents Available for Licensing or Sale. They were listed by General Electric Company in the Register section of the OFFICIAL GAZETTE, the first and second in the issue of Dec. 18, 1951, and the third in the issue of Jan. 18, 1955.

2,493,601. Fuse Link.

2,503,911. Protective Device.

2,685,013. Circuit Interrupting Device.

## CONDITION OF PATENT APPLICATIONS AS OF SEPTEMBER 28, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217,262 |
| Total number of pending Design applications | 6,321 |
| Total number of applications awaiting action (excluding Designs) | 120,204 |
| Total number of Design applications awaiting action | 2,772 |
| Date of oldest new application | Apr. 29, 1955 |
| Date of oldest amended application | May 18, 1954 |

ROSA, M. C., Director, Patent Examining Operation

| PATENT EXAMINING GROUPS, AND SUPERVISORY EXAMINERS | DIVISIONS |
|---|---|
| I. STONE, I. G., CHEMICAL AND RELATED ARTS | 6, 31, 36, 42, 46, 50, 55, 59, 60, 63, 64. |
| II. STRACHAN, C. W., COMMUNICATIONS, RADIANT ENERGY AND ELECTRICAL ARTS | 16, 23, 25, 37, 43, 44, 45, 51, 54, 69, 70. |
| III. YUNG KWAI, B., MECHANICAL MANUFACTURING, MACHINE ELEMENTS AND DESIGNS | 2, 12, 13, 14, 21, 24, 57, 58, 61, Designs. |
| IV. FREEHOF, H. B., MATERIAL HANDLING AND TREATING, OPTICS, RAILWAYS AND AMUSEMENT DEVICES. | 7, 11, 17, 27, 34, 35, 39, 53, 62. |
| V. HULL, J. S., STATIC STRUCTURES AND INSTRUMENTS OF PRECISION | 8, 20, 29, 33, 38, 40, 41, 52, 66. |
| VI. MURPHY, T. F., AGRICULTURE, TRANSPORTATION, PUMPS AND MOTORS | 1, 4, 5, 9, 10, 15, 22, 26, 45, 47. |
| VII. KAUFFMAN, H. E., HEATING AND COOLING, PLASTIC SHAPING AND COATING, SEPARATION AND MIXING, BODY TREATMENT AND CARE. | 3, 15, 19, 28, 30, 32, 49, 55, 67. |
| CL. GORECKI, G. A., ARTS UNDERGOING RECLASSIFICATION AS LISTED UNDER CLASSIFICATION DIVISIONS. | I, II, III, IV, V. |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application: New | Oldest Application: Amended |
|---|---|---|
| 1. (VI) GOLDBERG, A. J., Brakes; Excavating; Planting; Plant Husbandry; Scattering Unloaders | 10-21-55 | 11-9-54 |
| 2. (III) HERRMANN, D., Fishing, Trapping and Vermin Destroying; Presses; Tobacco; Textile Wringers | 12-23-55 | 6-7-55 |
| 3. (VII) LE ROY, C. A., Metal Founding and Treatment; Metallurgy (Process and Apparatus); Alloys | 1-23-56 | 11-9-54 |
| 4. (VI) FALLER, E. A., Hoists; Power Driven Conveyors; Handling Apparatus; Elevators; Feeding of Indefinite Lengths | 12-28-55 | 1-20-55 |
| 5. (VI) ROBINSON, C. W., Harvesters; Potato Diggers; Stalk Pullers and Choppers; Stone Gatherers; Threshing; Knotters; Animal Husbandry; Bee Culture; Dairy; Butchering; Vegetable and Meat Cutters and Comminutors; Fences; Gates | 12-12-55 | 5-3-55 |
| 6. (I) SURLE, H., Carbon Chemistry (part), e. g. Natural Resins, Proteins, Heterocyclic Amides, Amines, General Organic Processes | 7-1-55 | 3-10-55 |
| 7. (IV) GONSALVES, J. E., Optics, Photographic Apparatus | 12-9-55 | 1-3-55 |
| 8. (V) LEWIS, R. O., Beds; Chairs and Seats; Cabinets; Tables; Miscellaneous Furniture | 7-14-55 | 9-22-54 |
| 9. (VI) BRANSON, J. H., Pumps; Fans; Turbines | 12-30-55 | 12-14-54 |
| 10. (VI) BOYD, S., Firearms; Ordnance; Ammunition; Explosive Charge Making | 9-21-55 | 1-17-55 |
| 11. (IV) BENHAM, E. V., Boots, Shoes and Leggings; Shoe and Leather Manufacture; Button, Eyelet and Rivet Setting; Nailing, Stapling and Clip Clenching; Card, Picture and Sign Exhibiting; Cutlery; Cleaning and Liquid Treatment of Solids | 2-3-56 | 4-6-55 |
| 12. (III) SPINTMAN, S., Machine Elements; Engine Starters; Interrelated Clutch and Motor Controls | 10-10-55 | 7-12-54 |
| 13. (III) BEALL, T. E., Gear Cutting; Electric Lamp and Tube Manufacture; Needle and Pin Making; Metal Working (part), e. g. Special Work, Forging, Plastic Working, Drawing, Sawing, Milling, Planing, Turning | 12-5-55 | 10-4-54 |
| 14. (III) MANIAN, J. C., Metal Working (part), e. g. Sheet Metal, Wire Bending, Miscellaneous Processes, Assembly and Disassembly Apparatus; Wire Fabrics; Air Brakes | 9-20-55 | 9-17-54 |
| 15. (VII) BRINDISI, M. V., Plastics; Plastic Block and Earthenware Apparatus; Glass | 1-9-56 | 9-22-54 |
| 16. (II) LOVEWELL, N. N., Television; Telephony; Recorders | 9-26-55 | 7-30-54 |
| 17. (IV) LEIGHEY, R. A. (HOFFMAN, R. J., acting), Paper Manufactures; Packaging; Typewriters; Printing; Type Casting and Setting; Sheet Material Association or Folding; Sheet or Web Feeding | 11-14-55 | 1-7-55 |
| 18. (VI) BLUM, A., Power Plants; Fluid Transmissions; Servomotor Systems; Jet Motors; Combustion Turbines; Speed Responsive Devices | 11-16-55 | 11-20-54 |
| 19. (VII) PATRICK, P. L., Stoves and Furnaces; Boilers; Concentrating Evaporators; Fluid Fuel Burners | 12-14-55 | 4-25-55 |
| 20. (V) BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Safes; Bank Protection; Bread, Pastry and Confection Making; Tents and Canopies; Umbrellas; Canes; Undertaking | 1-10-56 | 1-3-55 |
| 21. (III) MADER, R. C., Textiles | 12-6-55 | 1-12-55 |
| 22. (VI) MARLAND, M. L., Aeronautics; Boats; Buoys; Ships; Marine Propulsion; Propellers; Windmills; Fluid Diaphragms and Bellows; Boring and Drilling | 11-25-55 | 11-9-54 |
| 23. (II) ANDRUS, L. M., Cash and Fare Registers; Calculators and Counters; Education | 8-8-55 | 5-18-54 |
| 24. (III) DRACOPOULOS, P. T. (HICKEY, T. J., acting), Apparel (except Corsets and Brassieres); Apparel Apparatus; Sewing Machines; Textiles, Ironing or Smoothing; Clutches and Power-Stop Control | 1-9-56 | 10-14-54 |
| 25. (VII) NEVIUS, R. D., Coating—Processes, Miscellaneous Products and Apparatus; Distillation; Wood Treating Apparatus | 10-27-55 | 1-3-55 |
| 26. (II) YOUNG, R. R., Electricity—Generation, Motive Power, Transmission Systems, Voltage and Phase Control Systems, Furnaces, Battery Charging and Discharging, Arc Lamps, Prime Mover Dynamo Plants; Elevators (part), e. g. Miscellaneous Electric Control Mechanism | 1-31-56 | 7-26-55 |
| 27. (IV) JAMES, S., Brushing, Scrubbing and General Cleaning; Brush, Broom and Mop Making | 1-9-56 | 3-11-55 |
| 28. (VI) BRAUNER, R. H., Internal Combustion Engines; Expansible Chamber Motors; Fluid Servomotors; Spring, Weight and Animal Powered Motors; Cylinders; Pistons; Drive Shafts; Flexible-Shaft Couplings; Chucks or Sockets; Cleats, Skid, Guide and Way Conveyors; Fluid Current Conveyors; Pressure Modulating Relays; Pneumatic Dispatch Store Service; Wheel Substitutes | 10-10-55 | 1-10-55 |
| 29. (V) HABECKER, L. B., Tools; Woodworking; Basket, Barrel and Wheel Making; Rubber Tire Removing Tools; Washing Machines; Baggage; Cloth, Leather and Rubber Receptacles; Package and Article Carriers | 11-22-55 | 3-21-55 |
| 30. (VII) O'LEARY, R. A., Refrigeration; Heating Systems; Automatic Temperature and Humidity Regulation, Thermostats, Electricity; Incinerating Burners; Miscellaneous Heating | 4-9-56 | 5-9-55 |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application | |
|---|---|---|
| | New | Amended |
| 31. (I) HUTCHISON, E. W., Carbon Chemistry (part), e. g. Urea Adducts, Silicon Containing Carbon Compounds, Hydrogenation of Carbon Oxides, Partial Oxidation of Non-Aromatic Hydrocarbon Mixtures, Hydrocarbons, Halogenated Hydrocarbons | 9-9-55 | 5-17-55 |
| 32. (VII) BERMAN, H., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitation; Self Proportioning Fluid Systems; Liquid Level Responsive Systems; Fire Extinguishers | 1-9-56 | 6-13-55 |
| 33. (V) MUSHAKE, W. L., Bridges; Hydraulic and Earth Engineering; Building Structures; Roads and Pavements | 12-13-55 | 9-14-54 |
| 34. (IV) SAPERSTEIN, S., Railways—Draft Appliances, Switches and Signals, Surface Track, Rolling Stock, Track Sanders; Electricity, Transmission to Vehicles; Dumping Vehicles; Vehicle Fenders; Hand and Hoist Line Implements | 11-22-55 | 9-13-54 |
| 35. (IV) BROMLEY, E. D., Dispensing; Fluent Material Handling, Filling; Toilet, Kitchen and Table Articles | 1-18-56 | 8-16-55 |
| 36. (V) McFADYEN, A. D., Measuring and Testing | 9-26-55 | 9-6-55 |
| 37. (II) LEVY, M. L., Electricity—Switches, Welding, Heating | 10-14-55 | 2-11-55 |
| 38. (I) MARMELSTEIN, N., Carbon Chemistry (part), e. g., Azo, Carbocyclic or Acyclic Compounds (part), e. g. Anthrones, Triarylmethanes, Esters, Acids, Ketones, Aldehydes, Ethers, Phenols, Alcohols | 1-5-56 | 6-6-55 |
| 39. (IV) WEIL, I., Fluid-Pressure Regulators; Valves; Fluid Handling (except Pressure Modulating Relays, Self-Proportioning Systems, Float Valves, Diaphragms and Bellows) | 1-3-56 | 10-1-54 |
| 40. (V) DRUMMOND, E. J., Receptacles—Metallic, Paper, Wooden, Glass; Special Receptacles and Packages | 1-9-56 | 8-1-55 |
| 41. (V) GURLEY, R. B., Coin Controlled Apparatus; Dispensing Cabinets; Coin Handling; Mail, Fare or Other Collection Boxes or Chutes; Buckles, Buttons and Clasps; Racks; Fire Escapes; Ladders; Scaffords | 7-20-55 | 9-3-54 |
| 42. (II) MARANS, H., Electric Signaling; Signals and Indicators; Telegraphy; Electrical Connectors | 4-29-55 | 10-19-54 |
| 43. (I) ARNOLD, D., Medicines, Poisons, Cosmetics; Sugar and Starch; Skins, and Leathers; Preserving, Sterilizing and Disinfecting (except Wood Treatment Apparatus) | 9-29-55 | 1-26-55 |
| 44. (II) EVANS, N. H., Antennas; Automatic Pilots; Directive Radio Systems; Mass Spectrometers; Nuclear Batteries; Nuclear Resonant Devices; Neutron Detecting and Measuring; Radar, Sonar; Torpedoes | 6-2-55 | 6-18-54 |
| 45. (VI) MANIAN, J. A., Wheels, Tires and Axles; Railway Wheels and Axles; Lubrication; Bearings and Guides; Belt and Sprocket Gearing; Spring Devices; Animal Draft Appliances | 10-26-55 | 2-9-55 |
| 46. (I) WILES, W. G., Actinide Series (e. g., fissionable) Compounds; Sintered Metal Stock; Explosives; Power Plants (part); Metallurgy (part); Surgery (part); Radioactive Medicines; Irradiation Chemistry; Carbon Chemistry (part) | 7-26-55 | 1-10-55 |
| 47. (VI) KANOF, W. J., Mining, Quarrying, and Ice Harvesting; Motor Vehicles; Land Vehicles | 1-10-56 | 7-20-55 |
| 48. (II) BERNSTEIN, S., Electricity—Conversion Systems, Protective Systems; Measuring and Testing (except Meters); Spark Plugs and Ignition Systems, Switchboards, Relays, Magnets, Inductors, Transformers, Condensers, Transistors, Barrier Layer Rectifiers | 8-12-55 | 9-13-54 |
| 49. (VII) BENDETT, B., Drying and Gas or Vapor Contact with Solids; Ventilation; Wells; Earth Boring | 9-1-55 | 2-21-55 |
| 50. (I) BENGEL, W. G., Carbon Chemistry (part), e. g. Synthetic Resin Compositions, Synthetic Rubber Compositions, Natural Rubber | 12-30-55 | 9-7-54 |
| 51. (II) YAFFEE, S., Radio Transmitters, Receivers and Tuners; Modulators; Piezoelectric Devices; Music | 12-29-55 | 8-24-54 |
| 52. (V) NEFF, F. R., Supports Joint Packing; Valved Pipe Joints or Couplings; Rod Joints or Couplings; Tool Handle Fastenings; Pipes and Tubular Conduits; Shaft Packing | 10-24-55 | 11-15-54 |
| 53. (IV) REYNOLDS, E. R., (NINAS, G. A., acting), Label Pasting and Paper Hanging; Books and Book Making; Manifolding; Printed Matter; Stationery; Paper Files and Binders; Flexible or Portable Closures or Partitions; Doors, Windows, Awnings and Shutters; Harness; Whip Apparatus | 12-2-55 | 3-30-55 |
| 54. (II) NILSON, R. G., Electric Lamps; Electronic Tubes; Miscellaneous Discharge Devices; Lamp, Cathode Ray and Gas Discharge Device Circuits; Ray Energy (e. g. X-Ray, Ultraviolet, Radioactive) Applications | 10-24-55 | 10-4-54 |
| 55. (VII) KLINE, J. R., Surgery; Dentistry; Artificial Body Members; Separating and Sorting Solids; Centrifugal Bowl Separators; Comminutors | 7-28-55 | 11-15-54 |
| 56. (I) SPECK, J. R., Abrading Compositions; Batteries; Coating or Plastic Compositions; Electrical and Wave Energy Chemistry | 12-22-55 | 9-13-55 |
| 57. (III) MILLER, A. B., Bolt, Nut, Rivet, Nail, Screw, Chain and Horseshoe Making; Driven and Screw Fastenings; Nut and Bolt Locks; Jewelry; Pipe Joints or Couplings | 3-19-56 | 2-2-55 |
| 58. (III) BRONAUGH, F. H., Rolls and Rollers; Making Metal Tools and Implements; Stone Working; Abrading Processes and Apparatus; Food Apparatus; Closure Operators; Baths, Closets, Sinks and Spittons | 10-17-55 | 11-4-54 |
| 59. (I) HENKIN, B., Inorganic Chemistry; Fertilizers; Gas, Heating and Illuminating | 9-30-55 | 1-24-55 |
| 60. (I) MANGAN, P. E., Carbon Chemistry (part), e. g., Synthetic Resins, Synthetic Rubber; Photographic Processes and Products | 8-2-55 | 9-30-54 |
| 61. (III) MORSE (Miss), E. L., Winding and Reeling; Pushing and Pulling; Horology; Time Controlling Apparatus; Railway Mail Delivery | 12-6-55 | 3-4-55 |
| 62. (IV) SHAPIRO, A., Games; Toys; Amusements and Exercising Devices; Mechanical Guns and Projectors; Illumination | 1-9-56 | 7-5-55 |

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during November 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1953*.

Patents ..... Numbers 2,178,536 to 2,181,557, inclusive
Plant Patent ..... Numbers 346 to 348, inclusive

# PATENT SUITS

Notices under 35 U. S. C. 290; Patent Act of 1952

2,285,840, S. A. Scherbatskoy, Well survey method and apparatus; 2,289,926, J. Neufeld, same; Re. 24,226, 2,303,693, R. E. Fearon, Well surveying method and apparatus; 2,349,712, same, Well logging method and device; 2,626,994, J. Neufeld, Spectrometer, included by amended complaint filed Oct. 9, 1956, D. C., S. D. Tex. (Houston), Doc. 9617, *Well Surveys, Inc.* v. *McCullough Tool Co.*

2,289,926. (See 2,285,840.)

2,303,693. (See 2,285,840.)

2,349,712. (See 2,285,840.)

2,477,443, S. Friedman, Fur conditioning machine, filed Apr. 19, 1956, D. C. N. J. (Newark), Doc. 353/56, *Reliable Machine Works, Inc.* v. *Glenview Metal Products Co.* Stipulation and order of dismissal Sept. 28, 1956.

2,494,397, R. J. Lusk, Electric generating system; 2,534,895, B. O. Austin et al., Auxiliary power system for aircraft; 2,599,365, J. D. Miner, Jr. et al., Control and protection of electric power system; 2,627,602, same, Electrical power system for aircraft, filed Oct. 12, 1956, Ct. Cls., Doc. 440/56, *Westinghouse Electric Corp.* v. *The United States.*

2,534,895. (See 2,494,397.)

2,568,567, M. Perlman, Humidifier; 2,709,427, same, Humidifier for air heating furnaces; 2,709,428, same, Humidifiers having supporting arms for evaporator plates; 2,709,429, same, Humidifiers having basket means for pan and plates, filed Oct. 17, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c1716, *Auto Flo Corp.* v. *M. Brucker, Inc.*

2,599,365. (See 2,494,397.)

2,627,602. (See 2,494,397.)

2,626,994. (See 2,285,840.)

2,627,999, R. C. Sharp, Method of making a prepared sweet potato flour mix and product, filed Oct. 3, 1956, D. C., N. D. Calif. (San Francisco), Doc. 30873, *Ruth C. Sharp* v. *Stiefvater's.*

2,709,427. (See 2,568,567.)

2,709,428. (See 2,568,567.)

2,709,429. (See 2,568,567.)

2,718,674, C. E. Hinds, Siding panel, filed Sept. 26, 1956, D. C., N. D. Ind. (South Bend), Doc. 2123, *Bird & Son, Inc.* v. *Mastic Asphalt Corp.*

2,741,221, Weiskopf and Ferrari, Automatic immersion apparatus, filed Apr. 30, 1956, D. C., E. D. N. Y. (Brooklyn), Doc. 16507, *Technicon International, Ltd.* et al. v. *American Hospital Supply Corp.* Case discontinued Oct. 16, 1956.

Re. 23,416, C. W. Kinnear, Drill, filed Apr. 6, 1953, D. C., E. D. Tex. (Beaumont), Doc. 2363, *Kinnear-Wood Corp.* v. *Humble Oil and Refining Co.* Judgment for defendant; patent held invalid and not infringed Oct. 10, 1956.

Re. 24,226. (See 2,285,840.)

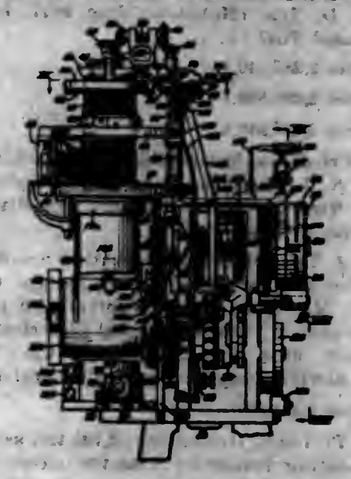
Des. 168,974, J. H. Spaulding, Fluorescent lighting fixture, filed Oct. 11, 1956, D. C., N. D. Ill. (Chicago), Doc. 56c1694, *Whiteway Mfg. Co.* v. *Guardian Light Co., Inc.*

# REISSUES

## NOVEMBER 20, 1956

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.

### 24,239



### AUTOMATIC STITCH LENGTH CONTROL MECHANISM FOR KNITTING MACHINES

Vernon Thomas Stack, Winston-Salem, N. C., assignor, by mesne assignments, to Wilkes Hosiery Mills Company, North Wilkesboro, N. C., a corporation of North Carolina

Original No. 2,685,786, dated August 10, 1954, Serial No. 332,900, January 23, 1953. Application for reissue October 5, 1955, Serial No. 539,818

34 Claims. (Cl. 66—55)

*27. In automatic stitch length control mechanism for a knitting machine having independent needles and sinkers cooperative with the needles in forming fabric loops from yarn fed to the needles, regulating means for varying the operative relationship between the needles and the sinkers during the knitting of successive portions of the fabric for increase or decrease in the size of the loops to shape the fabric, said regulating means including detector means responsive to the size of the fabric loops produced; and means responsive to the detector means and influential upon the regulating means to vary the operative relationship between the needles and the sinkers as may be*

*necessary for loop control within the successive portions so formed.*

# PLANT PATENTS

## GRANTED NOVEMBER 20, 1956

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

### 1,528

### ROSE PLANT

Paul B. Begonia, San Jose, Calif., assignor to Germain's, Inc., Los Angeles, Calif., a corporation of California

Application December 5, 1955, Serial No. 551,187

1 Claim. (Cl. 47—61)

A new and distinct variety of rose plant of the climbing hybrid tea class, substantially as herein shown and described, characterized particularly as to novelty by being substantially identical with its parent variety "Chrysler Imperial" (Plant Patent No. 1167), but essentially being distinguished therefrom by its vigorous and climbing habit of growth.

### 1,529

### ROSE PLANT

Eugene S. Boerner, Newark, N. Y., assignor, by mesne assignments, to C. W. Stuart & Co., Newark, N. Y., a corporation of New York

Application January 4, 1956, Serial No. 557,423

1 Claim. (Cl. 47—61)

A new and distinct variety of rose plant of the everblooming large-flowered climber class, substantially as herein shown and described, characterized particularly as to novelty by its continuity of bloom, its habit of bearing flowers in large clusters on long and vigorous stems, the semi-double form of its flowers in which the central petals are recurved and hide the stamens and pistils and thereby give the flowers a double appearance, and the distinctive Tyrian Rose general color tonality of the flowers which does not fade, even in hot weather, until the petals fall.

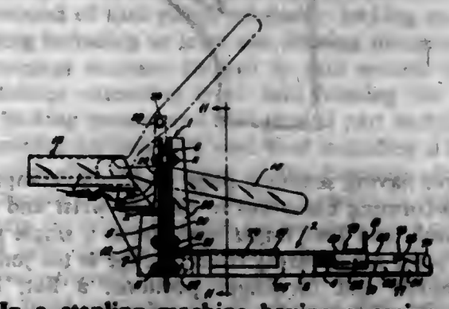
# PATENTS

## GRANTED NOVEMBER 20, 1956

## GENERAL AND MECHANICAL

### ERRATUM

For Class 1—44.5 see: Patent No. 2,771,607



### 2,770,804

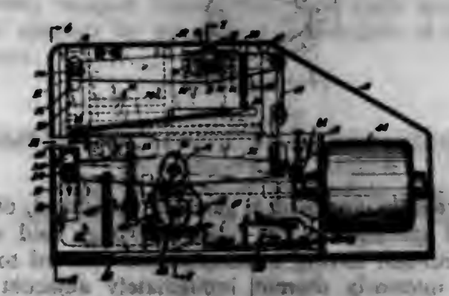
### STAPLING MACHINE

Werner Schaffrath, Carson, Nev.

Application June 23, 1954, Serial No. 438,679

10 Claims. (Cl. 1—49)

1. In a stapling machine having a casing with movable anvils therein, each of said anvils having a relatively narrow throat portion, a relatively long lower cutting edge, and an inner clinching surface, means mounting said anvils for downward movement from said casing for first cutting and penetrating the material to be stapled with said lower cutting edges and then moving said throat portions of said anvils inwardly along the cuts so formed into final clinching position, and means for forcing a staple from said casing through said material, said inner clinching surfaces of said anvils guiding and bending said staple into clinched position.



### 2,770,805

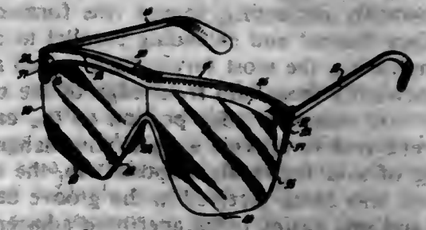
### STAPLING MACHINES

Philip Elser, Rudolf Sommerfeld, and Theodore Anthony, Pittsburgh, Pa.

Application February 25, 1955, Serial No. 490,586

4 Claims. (Cl. 1—101)

1. A power driven stapling machine comprising a base, a frame on said base, upper and lower drive members on separate shafts, said shafts being intermediate the ends of the drive members and rotatable and reciprocable in slots in the frame, adjustable connecting means connecting one end of each drive member to one end of the other drive member, separate resilient means on the frame acting on each drive member to force the other unconnected ends of the two drive members apart, a staple driver mounted on one of said unconnected ends, cooperating anvil means on the other unconnected end, cam means rotatably mounted in the frame and engaging one of the drive members at its shaft whereby upon complete rotation of the cam means the shaft is raised and lowered and the staple driver and anvil are brought together and then separated thereby setting a staple placed between them, electrically actuated power means on the base operatively connected to the cam for rotating the cam, a movable abutment adjacent the staple driver and anvil means for contacting a group of papers to be stapled and contactor means for introducing an electrical current to the power means when a group of papers to be stapled is brought into contact with the abutment and current interrupting means for interrupting the current when the cam means has made a complete rotation.



### 2,770,806

### PARTIAL FRAME TYPE SPECTACLES HAVING REMOVABLE SHIELD SECTION

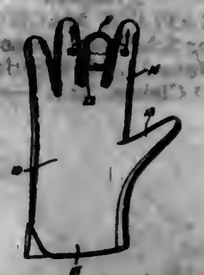
William C. Moeller, Kansas City, Mo., assignor to Parmalee Plastics Company, Kansas City, Mo., a corporation of Missouri

Application September 7, 1954, Serial No. 454,376

1 Claim. (Cl. 2—12)

In a spectacle assembly, an elongated, relatively flexible, transparent eye shield having a nose-receiving notch in the normally lowermost, longitudinal edge thereof and a web-receiving notch of major, substantially circularly segmental configuration in each end edge thereof respectively, said web-receiving notches being disposed between the longitudinal edges of the shield, each end edge being convexly curved between said web-receiving notch thereof and the normally uppermost, longitudinal edge of the shield; and a resilient, inverted U-shaped frame having an elongated, bight portion substantially coextensive in length with said uppermost edge of the shield and a pair of depending leg portions, said frame being provided with a continuous, inwardly-facing groove intermediate its thickness, that part of said groove disposed within said bight portion being substantially complemental to a marginal portion of the shield disposed along said uppermost edge of the latter, those parts of said groove disposed within said leg portions being substantially complemental to marginal portions of the shield disposed along corresponding end edges of the latter, there being an integral web of substantially circular cross-section and of diameter slightly greater than the distance across the open extremity of a corresponding web-receiving notch into which it is adapted to be snapably received extending transversely across said groove in each of said leg portions respectively, said webs being disposed for seating in said web-receiving notches when said uppermost edge and a portion of said end edges of the shield are substantially fully seated within said groove of the frame, the lowermost extremities of said leg portions being transversely bifurcated to provide guide notches adapted to slide along said curved portion of the end edges during assembly of the shield into the frame.

2,770,807
SAFETY GOGGLE
Norman J. Taylor, Kenmore, and Roy A. Bright, North Tonawanda, N. Y., assignors to Virginia I. Du Bois, Snyder, Lauriane T. Holzworth, Rita C. Sterne, and Eileen Silbert, Buffalo, and Florence E. Taylor, Kenmore, N. Y.
Application January 13, 1954, Serial No. 403,689
2 Claims. (Cl. 2—14)



1. A goggle comprising a lens formed of transparent sheet material of generally continuous rounded profile form being outwardly distended into a conical nose rest portion medially of the bottom edge thereof, the bottom marginal edge of said lens having a pair of downwardly projecting, integrally formed hook members located immediately adjacent to and on opposite sides of said nose rest portion, each hook member presenting a retaining slot having its open end adjacent said nose rest portion, and a unitary casing formed of elastic sheet material of generally C-shaped configuration having its rear edge shaped to generally conform to the facial features of the goggle wearer and having its forward portion embracing the periphery of said lens member, said casing having a pair of inwardly projecting, spaced ribs formed on the inner surface thereof and extending parallel to the front edge of the casing, the most forwardly disposed rib being spaced rearwardly from said front edge of the casing so that a forward marginal edge portion of the casing extends therebeyond to provide a rigidifying flange inhibiting flexing of said forwardly disposed rib, the marginal edge of said lens being received in the groove defined by said ribs, and said casing being apertured adjacent its opposite ends in the region between said ribs and receiving said hook portions of the lens, the casing portions immediately beyond such apertures and between said ribs being received in said retaining slots formed by said hook members, the opposite ends of the rear edge of said casing having outwardly projecting flanges formed integrally therewith to present smooth, flat surfaces where the casing contacts the wearer's face, and the terminal portion of each flange at its corresponding end of the casing extending back upon itself to present a generally U-shaped cross-sectional configuration embracing its corresponding hook member.

2,770,808
DEPOSITED RUBBER UNDERGARMENT WITH VARIEGATED SURFACES
Harry F. Bader, Harry J. Barth, and Paul E. Ambrose, Dover, Del.
Application February 13, 1953, Serial No. 336,836
1 Claim. (Cl. 2—37)

A shaped undergarment made of deposited latex forming a wall having a filamented inner and an outer mat surface, said filamented inner surface having filaments embedded in the inner surface of the wall so as to space said inner surface from the skin and permit perspiration to circulate therebetween and evaporate, said outer mat surface being a replica of the mat finish of the form on which the undergarment was deposited, whereby the generation of static electricity is limited.

2,770,809
GLOVE WITH SEAMLESS PALM AND BACK
Frank W. Howard, Idaho Falls, Idaho
Application September 23, 1954, Serial No. 457,928
2 Claims. (Cl. 2—169)

1. A glove having seamless palm and back, comprising a flat, palm-forming blank cut to provide wrist and palm proper, thumb, and four finger portions as a single piece, said blank being slit inwardly from its edge at the juncture between thumb and forefinger portions; a flat, back-forming blank cut to provide glove wrist and back proper and four finger portions as a single piece; a flat, thumb-insert blank cut to provide thumb back, longitudinal wrist, and tie-in tab portions as a single piece, and being inset between said palm-forming and said back-forming blanks to complete the thumb of the glove; fourchette-providing blanks of widespread V-formation inset between said palm-forming and said back-forming blanks, laterally of corresponding finger portions thereof, to complete the fingers of the glove; and seams joining the several blanks together about their contiguous marginal edges.

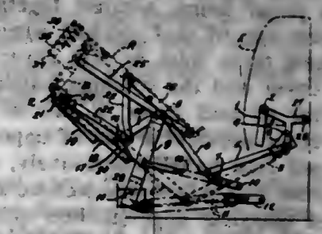
2,770,810
VENTILATING WAISTBAND
Joseph De Grazia, Washington, D. C.
Application June 9, 1954, Serial No. 435,650
3 Claims. (Cl. 2—236)
(Granted under Title 35, U. S. Code (1952), sec. 266)

3. The combination with a garment waistband, of first and second spaced belt slits formed through said waistband, a semi-belt having a tethered end secured to said waistband interiorly thereof immediately adjacent said first slit, securing means at least partially on said waistband beyond said second slit, said semi-belt having a free end, said semi-belt being shorter than that portion of said waistband lying between said tethered end and said securing means to provide a gathering in said portion of said waistband, said semi-belt at times extending to said securing means through said first slit so as to overlie and flatten said gathering, and means between said slits for readily releasably connecting at least one intermediate portion of said semi-belt to said waistband interiorly thereof when said semi-belt extends through said second slit to said securing means.

2,770,811
ARTIFICIAL LIMBS
Charles Philip Steeper, Rochampton, London, England
Application April 29, 1952, Serial No. 284,943
8 Claims. (Cl. 3—22)

1. In an elbow joint of the class described, in combination, a pair of co-operating parts, one part consisting of a first steel, a housing formed at one end of said first steel, a bearing formed in said housing for rotatively supporting the second of said parts, releasable locking means in said housing including at least one locking plunger adapted to interengage recesses formed in said second part, instrumentalities extending from said housing for controlling said locking means, and said second part including a steel, an annulus formed with said steel including a bearing surface engaging the bearing of the housing aforesaid, and the recesses mentioned being formed in said housing, wherein the releasable lock means includes a cam comprising a cam disc mounted on a driving disc and movable relatively thereto, said cam disc including a ratchet wheel, and a pawl mounted on the driving disc and adapted to engage said ratchet wheel to effect rotation of said cam disc under the control of said controlling instrumentalities.

2,770,812
BODY SUPPORTING AND BATHING DEVICE
Richard H. Whiteside, Corcoran, Calif.
Application June 7, 1954, Serial No. 434,693
12 Claims. (Cl. 4—145)



1. An article of furniture comprising an open frame of hollow tubular construction, body support means of sheet material tensioned within the frame, the frame having orifices therein for directing a spray of fluid over the body support means, and fluid inlet means in the frame adapted for connection to a source of fluid under pressure.

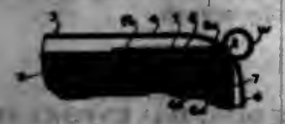
2,770,813
COMBINATION WARDROBE, UPENDING BED, AND DRESSING TABLE
Paul A. Mercillier, Milwaukee, Wis.
Application June 14, 1948, Serial No. 32,986
7 Claims. (Cl. 5—2)

1. A device of the character described comprising the combination with a cabinet having side walls having forward margins and a bottom projecting forwardly of said margins, of pintle receptacles located on the bottom forwardly of said margins and each provided with a transversely extending pintle, a bed having a head portion and provided with legs pivoted upon the respective pintles for movement between a stored position in said cabinet and a horizontal position for use, the head portion of the bed being vertically aligned with said legs whereby in the latter position the head portion is wholly forward of said margins, and doors pivotally connected by hinges with the cabinet contiguous to said forward margins of the side walls, said doors comprising box sections having side walls with edges to which said door hinges are mounted, said sections further comprising front panels offset from said hinges sufficiently to extend substantially flush with said bottom and to enclose said pintle receptacles when closed, the location of the pivotal connection of the doors with the cabinet being sufficiently rearwardly offset from said receptacles so that said doors leave the head portion of the bed substantially fully exposed when the doors are fully opened.

2,770,814
FOLDING DAVENPORT BEDS
Fred G. Schindler, Affton, Mo., assignor to Smith & Davis Manufacturing Company, St. Louis, Mo., a corporation of Missouri
Application September 14, 1953, Serial No. 379,975
7 Claims. (Cl. 5—13)

1. In a davenport bed, a folding structure, comprising, a series of articulated sections including a foot section and second and third sections provided with a mattress-receiving area movable with said sections to extended position and foldable to closed position with the mattress between said sections, a lever pivoted to said third section, a link connecting one end of said lever with said foot section, and means coacting with the other end of said lever when said sections are being closed to press the foot section down.

2,770,815
ARTICLE OF FURNITURE
Francis Jackson Keys, Pasadena, Calif.
Application September 6, 1952, Serial No. 308,264
5 Claims. (Cl. 5—37)

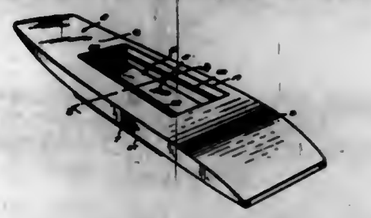


1. An article of furniture capable of serving as a divan and a bedstead, comprising a pair of spaced apart head boards, a base-member connecting the same, a seat-member and a back-member above the base-member extending through the space between the head boards, a pivotal connection on each head board located at the level of the upper sides of the seat member and the back-member common to the seat-member and the back-member connecting the same to the head-boards, said pivotal connections located adjacent to, and inwardly with respect to the rear edge of the base-member, and at a sufficient height above the base-member to enable the back-member to rest in a horizontal position above the upper side of the base member, and supported in that position by said pivotal connections and the portion of the upper side

of the base-member located to the rear of the axis of the pivotal connection, and disconnectible means including a coupling part on the seat-member and a coupling part on the back-member; and a single coupling part mounted on each head-board cooperating with each of said first named coupling parts to hold either the back-member or the seat-member in an inclined position.

---

**2,770,816**
**CUSHIONS AND METHOD OF MAKING THE SAME**
**Michael Reisner, Port Chester, N. Y.**
**Application September 6, 1955, Serial No. 532,434**
**9 Claims. (Cl. 5—355)**



1. A cushion having a foam elastomer core enclosed within a fabric cover, said cover comprising top and bottom face panels and an intermeditae border panel, edges of said face panels and correspondingly adjacent edges of said border panel being secured together by stitched seams, at least one of said stitched edges of said seams around at least three sides of said cover being disposed within said cover and the stitching passing therethrough to the interior of said cover, a pair of tapes disposed within said cover adjacent a pair of opposite edge seams of one of said face panels respectively, said tapes each having an inner face adhesively secured to said core and an outermost marginal edge stitched to a panel edge of the respectively adjacent seam, the outer faces of said tapes throughout their extent inwardly from said adjacent edge seams being free of attachment to said cover.

5. The method of making a cushion having a foam elastomer core and a fabric cover which comprises providing a plurality of fastening tape each having on one face an adhesive coating extending lengthwise thereof intermediate uncoated marginal edge zones and provided with a mask covering said adhesive, stitching an uncoated marginal edge zone of each said tape at a respectively adjacent seam connecting an edge of a face panel to a corresponding edge of the border panel of said cover by stitching passing through at least one of said cover edges and releasably securing the opposite uncoated marginal edge of said tape to the inner face of said fabric cover, said tape being positioned with its masked adhesive coating facing inwardly of said cover, thereafter inserting the core within the cover casing through an open mouth of said casing with the edge seams of the cover aligned with the corresponding edges of the core, detaching the masking strip so as to expose the adhesive coating on the tape and pressing the tape into intimate engagement with the core so as to adhesively secure the tape to the core, detaching the innermost marginal uncoated edge of the tape from the cover and closing the mouth of the cover through which the core has been inserted.

---

**2,770,817**
**WATER CRAFT**
**Warner Woodworth, Hollywood, and Arthur Orr, North Miami, Fla.**
**Application June 13, 1955, Serial No. 515,054**
**3 Claims. (Cl. 9—3)**

1. A water craft comprising a buoyant hull that is composed of a bottom and an elevated deck and with the bottom and the deck being formed each of single sections of material, the hull including a bow portion and a stern portion and with the deck being downwardly curved at the stern portion for connection with an upwardly curved portion of the bottom and whereby the terminal end of the stern terminates at the water-line of the craft, the bottom and the deck being connected along their longitudinal edges by side panels, the deck being provided with a rectangular opening intermediate its ends, a cock-pit forming frame disposed within the craft and underlying the opening of the deck and with

the frame being connected to the bottom and the deck in a water-tight manner, the said hull and the said cock-pit frame forming air chambers for the craft along its sides and fore and aft of the cock-pit frame, grab rails disposed within the frame and vent openings formed in the cock-pit frame whereby to vent the air chambers.

---

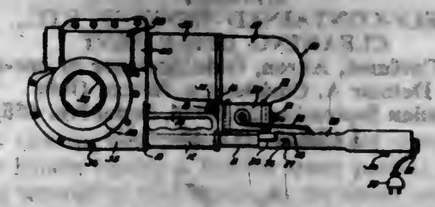
**2,770,818**
**METHOD OF FORGING A SLOTTED BOLT**
**Marvin Lee, Wilton, and Christian V. Pellier, Westport, Conn., assignors to Barnaby Engineering Co., Inc., a corporation of New York**
**Application May 2, 1955, Serial No. 505,239**
**2 Claims. (Cl. 10—27)**

1. The method of producing without scrap a slotted bolt provided with a head portion and two extending partially cylindrical threaded leg portions forming a slot therebetween, which comprises forming a continuous rod of suitable material having a uniform cross-sectional area corresponding to the exact cross-sectional area of one of the bolt portions, cutting off a length of the rod having the exact volume of the completed slotted bolt, applying pressure to the two ends of the cut-off piece, causing the metal to flow and be redistributed to form a longitudinally extending blank provided with two end portions having the exact cross-sectional area of the leg portions of the slotted bolt, and an intermediate portion of greater cross-section than the end portions; laterally swedging two sides of the entire length of the blank to provide a plurality of concave faces therein, the axes of which are perpendicular to the longitudinal axis of the blank, and simultaneously reshaping each of the leg portions to provide a partially cylindrical surface on one side and a flat surface on the other, all of said surfaces and faces being the original worked surfaces of the rod, thereafter bending the intermediate portion at the concave faces to form the slotted bolt, and finally threading the rounded partially cylindrical surfaces of the leg portions for receiving a nut.

---

**2,770,819**
**THREADING ATTACHMENT FOR MULTIPLE SPINDLE MACHINE**
**Arthur H. Jobert, New Britain, Conn., assignor to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut**
**Application November 6, 1952, Serial No. 319,911**
**23 Claims. (Cl. 10—89)**

1. In an attachment-operating mechanism of the character indicated, three mutually supporting elongated

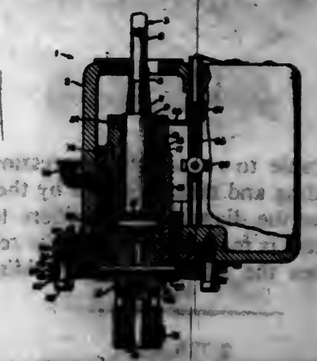


members slidable longitudinally with respect to each other, cooperating abutment means on two adjacent of said members for providing a limit of relative longitudinal feed of said two adjacent members with respect to each other, means for fixedly mounting one of said two

adjacent members to a machine frame, feed-thrust means carried by the remaining of said three members for translating feed thrusts from a driving member to a driven member, and connecting means between said remaining member and the other of said two adjacent members.

---

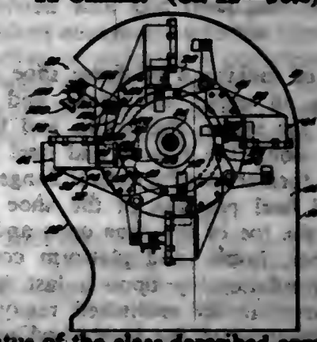
**2,770,820**
**PORTABLE PIPE THREADING TOOL**
**Louis Adolph Wiegel and Dave Wilson Wiegel, El Dorado, Ark., said Louis Adolph Wiegel assignor to Carol Mary Wiegel, El Dorado, Ark.**
**Application October 1, 1953, Serial No. 383,482**
**1 Claim. (Cl. 10—89)**



A portable pipe threading tool comprising a gear housing, a worm rotatable in said housing, a worm gear rotatable in said housing meshing with said worm, a die stock secured to said worm gear, a motor housing extending from said gear housing, a forward portion of said motor housing being supported in a recess in the gear housing, said recess being concentric with the worm gear and said motor housing supporting a reversible electric motor having a driving element for clutching engagement with the worm gear, a switch member controlling the motor, means securing said switch member to said motor housing, a pair of lugs carried by said switch member, a looped handle between said gear housing and said switch, a disc at the forward end of said handle, means securing said disc to said gear housing, a lug carried by said handle engaging between said pair of lugs, a bolt extending through said pair of lugs and said latter named lug, an elongated handle extension, and means detachably securing said handle extension to said handle.

---

**2,770,821**
**LEAD SCREW TAPPING ATTACHMENT HAVING TORQUE RESPONSIVE FEED NUT**
**William J. Adlof, North Riverside, Ill., assignor to Boyar-Schultz Corporation, Chicago, Ill., a corporation of Illinois**
**Application March 24, 1954, Serial No. 418,385**
**1 Claim. (Cl. 10—135)**



A lead screw tapping attachment comprising a driver assembly, a lead screw connected to the driver assembly, means securing the two against relative rotation, a nut assembly into which the lead screw threads, said nut assembly having a peripheral flange, friction disks engaging opposite faces of the flange, one of said disks bearing against a stationary bearing surface, means for forcing the other friction disk toward the said one friction disk for frictionally holding the nut assembly against turning but permitting such turning when the turning torque applied thereto exceeds the holding force of the friction disks, said last-mentioned means including a friction disk spring forcing said other disk against said flange for maintaining pressure between the disks and the flange in an amount determined by the setting of the spring, a stationary housing, and means mounting the assembly of the driver assembly and the nut assembly in the housing, said mounting means including at least one shoulder screw having a head bearing against the

friction disk spring and a shank threaded into the housing and a shoulder limiting the threading of the shoulder screw into the housing, the distance between the shoulder and the head of the screw being correlated to the spring tension to cause the spring to exert the required pressure between the friction disks and the flange when the screw is threaded to a position limited by the shoulder of the shoulder screw.

**2,770,822**
**SOLE ATTACHING MACHINE**
**Jacob Simon Kamberian, West Newton, Mass.**
**Application October 16, 1952, Serial No. 315,031**
**12 Claims. (Cl. 12—36.8)**

8. Apparatus of the class described comprising a frame provided with bearings for a horizontal shaft, means for turning the shaft continuously, a plurality of rigid supports radiating from the shaft, a pressure box mounted on each respective support, each pressure box having rigid side and bottom walls and a top wall which consists of an impervious elastically stretchable diaphragm, each box containing a fluid, a rigid, hollow cylinder fixed to the inner side wall of each box, the interior of each cylinder communicating with the interior of its respective box, a piston in each cylinder, a shoe-clamping lever associated with each box, each clamping lever having an arm which overhangs its respective box and which is operative to hold a shoe downwardly against the diaphragm, and cam means fixed relatively to the frame and which is operative, as the shaft turns, to actuate each clamping lever and each piston thereby to clamp a shoe to the diaphragm and thereafter to increase the fluid pressure in each successive box.

---

**2,770,823**
**MAGNETIC PAD BOX**
**Jacob S. Kamberian, West Newton, Mass.**
**Application January 28, 1953, Serial No. 333,739**
**11 Claims. (Cl. 12—33)**

3. In an apparatus for applying conforming pressure to a shoe bottom, a box having a yieldingly impression-

able material therein susceptible of receiving an impression, a diaphragm subtending the box and the material, said diaphragm being elastically yieldable to take the shape of an object pressed into the impressionable mate-

rial, means operable to render the impressionable material rigid or yielding and means carried by the diaphragm operable to cause the diaphragm to adhere to the material when the latter is made rigid and to be released from the material when the latter is made yielding.

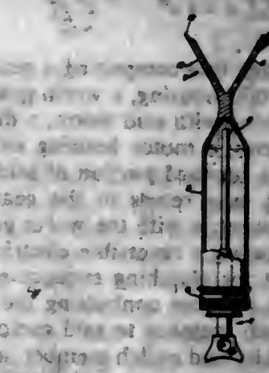
---

2,770,824
METHOD OF MAKING PLATFORM SHOES
John W. Murphy, St. Louis, Mo., assignor to Hamilton Shoe Company, St. Louis, Mo., a corporation of Missouri
Application October 12, 1953, Serial No. 385,549
1 Claim. (Cl. 12—142)

The method of making a platform shoe which comprises providing an upper, an insole, and a platform cover, stitching the upper, the insole, and the platform cover together along the lateral and heel portions of the shoe in the formation of a lateral flange around the ball, shank and heel portions of the shoe leaving the portion around the toe of the shoe open and unstitched, placing the upper, insole, and platform cover in such stitched-together relationship upon a last, pulling back the platform cover in its unstitched region to expose the unstitched margins of the insole and upper, lasting such exposed unstitched margins of the insole and upper, adhesively securing the exposed lasted margins of the insole and toe portion together, thereupon stitching the loose margin of the platform cover to the lasted margin of the upper and insole in the region of the toe portion of the shoe in the provision of a forwardly projecting common flange, and trimming said lateral flange and lasted margin to form a continuous marginal flange of substantially uniform width around the joined upper, insole, and platform cover.

---

2,770,825
CARPET SWEEPER AND BRUSH CLEANING COMBS THEREFOR
Fred W. Pullen, Grand Rapids, Mich., assignor to Bissell Carpet Sweeper Company, Grand Rapids, Mich.
Application September 10, 1951, Serial No. 245,830
4 Claims. (Cl. 15—48)



4. In combination, a carpet sweeper including a casing, a rotatively mounted brush, floor wheels drivingly associated with the brush, and a dustpan disposed at one side of the brush, of a comb mounted at the side of the brush above and adjacent to the dustpan to discharge thereto, said comb having a series of relatively long longitudinally curved and uniformly spaced teeth, and at least one short tooth disposed between adjacent long teeth, said long and short teeth being of substantially the same curvature and positioned to present their concaved sides to the brush, the long teeth being positioned so that only the outer end portions thereof penetrate the outer ends of the brush bristles as they are carried past the comb

on the rotation of the brush, the short teeth being positioned relative to the brush so that they do not substantially penetrate the brush bristles but brushingly coact with the ends thereof to remove material carried on the ends of the bristles as they sweep downwardly on the downward stroke of the bristles.

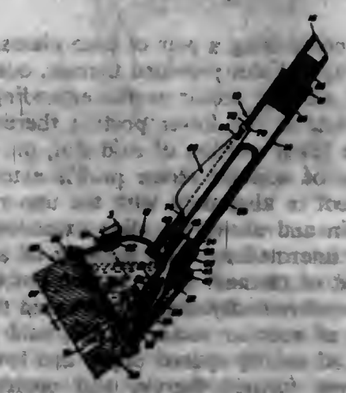
---

2,770,826
SELF-CONTAINED WINDOW, ETC., CLEANING IMPLEMENT
Budd G. Curfman, Akron, Ohio, assignor of one-sixth to Delmar A. Christensen, Akron, Ohio
Application September 28, 1954, Serial No. 458,734
1 Claim. (Cl. 15—105)

A cleaner of the character described comprising: a tubular handle for the reception of a cleaning fluid, a manually operable spray pump for the fluid on one end of said handle, and a substantially V-shaped head on the other end of the handle integral therewith, said head comprising a pair of integral, transversely elongated, rigid, divergent blades including parallel free transverse edges on the outer ends thereof, one of said blades carrying a cleaning element.

---

2,770,827
BATH BRUSH
Charlotte Brandenburg, San Antonio, Tex.
Application July 5, 1955, Serial No. 520,687
1 Claim. (Cl. 15—128)



A bath brush comprising a head, a handle extending from said head, a liquid conduit in said head, said conduit being a spirally shaped tube having its internal end at the center portion of said head and its external end integral with an inlet tube, said inlet tube extending longitudinally through said handle and terminating in an

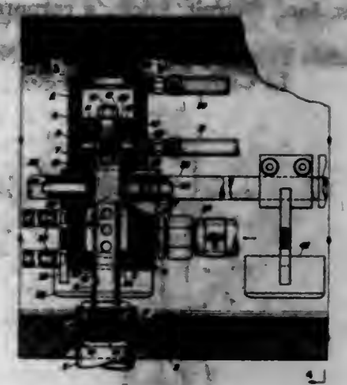
inlet coupling, said spirally shaped tube being rectangular in cross-section and being provided with closely-spaced, alternating bristle tufts and spray openings in the bottom wall thereof, said head comprising a top imperforate wall having a peripheral depending skirt, said skirt having an inwardly extending flange at the lower rim thereof, said flange and skirt embracing said spirally shaped tube at its outer coil.

---

2,770,828
CLEANING DEVICE, INCLUDING FLUID DISPENSING MEANS
Jacob L. Ellman, Chicago, Ill.
Application September 26, 1952, Serial No. 311,651
3 Claims. (Cl. 15—131)

1. A cleaning and polishing implement comprising an upright handle having a hollow lower portion, a hollow housing secured to said handle at the lower end thereof, said housing having an open lower end, a plate secured to said housing and normally closing said open lower end to form in combination with said housing a liquid reservoir, a wiping element underlying said plate, fastening means detachably securing said wiping element to said plate, a liquid pump assembled with said plate as a unit, said liquid pump including a valve assembly and a pump member, said valve assembly being disposed within said housing and adapted to communicate with both the interior of said housing for receiving liquid therefrom and with said wiping element for distributing liquid thereto, said pump member being disposed in said hollow lower portion, means carried by said handle for actuating said pump member.

---



2,770,829
SCRAPER
Holly L. Williams, Warrenville, S. C.
Application March 15, 1954, Serial No. 416,250
2 Claims. (Cl. 15—236)

2. A combination scoop and scraper of substantially semicircular shape including a substantially flat semicircular bottom and a semicylindrical wall having a longitudinal bottom edge joined to and rising from said bottom, said bottom having a straight front edge forming a scraping edge having ends disposed adjacent the ends of the wall, and the ends and top edge of said wall constituting scraping edges, said top edge constituting a semicircular scraping edge all portions of which are disposed coplanar and in a plane parallel to the plane of the bottom.

---

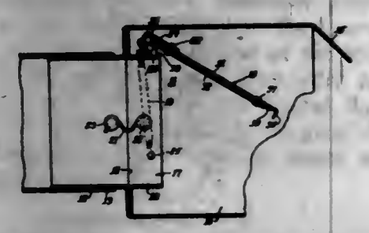
2,770,830
AIR LANCE FOR BLOWING OUT SUPERHEATER ELEMENTS AND THE LIKE
William J. Vogel, Upper Montclair, N. J., Emil Kanstz, Hartsdale, N. Y., and Paul J. Kiefer, Chattanooga, Tenn., assignors to Combustion Engineering, Inc., New York, N. Y., a corporation of Delaware
Application January 9, 1951, Serial No. 205,136
5 Claims. (Cl. 15—406)

2. A lance for use in a boiler header to blow out the tubes connected therewith comprising a generally vertically disposed body portion bounding a chamber, a generally vertical hollow shaft extending through the body portion, being guided at the opposite ends thereof and having its interior in communication with said chamber, a motor connected to the upper end of said shaft operative to effect longitudinal movement of the shaft, the lower end of said shaft being adapted to be associated with one of said tubes when the shaft occupies its lower position, means associated with said body portion and including support members engageable with the interior of the header wall effective to maintain a predetermined minimum distance between the lower end of the body portion and the header wall therebelow into which distance the lower end of the shaft retracts when in its upper position.

---

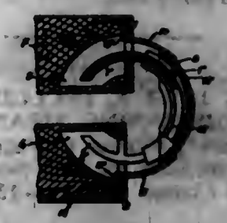
2,770,831
RETRACTABLE BALL-TYPE CASTERING DEVICE
Wilbert W. Angelica, Cicero, and Robert T. Miller, Clarendon Hills, Ill.
Application June 13, 1955, Serial No. 515,124
6 Claims. (Cl. 16—24)

6. A caster device adapted to be attached to objects to be moved from one place to another, comprising: a casing having an inner wall, said casing having a lower portion provided with an opening, a carrier movably disposed within said casing, a recess disposed in the wall, said recess having at least one tapered surface a roller connected to said carrier in relative rolling relation, a resilient stop carried by said carrier, said stop being normally urged laterally outwardly independently of said carrier into engagement with the recess and tapered surface, a resilient means within said casing adapted to urge said carrier to an operative position whereby said roller projects outwardly of said casing, and whereby said stop is engaged in said recess for locking said carrier in position relative to said casing, said carrier being movable



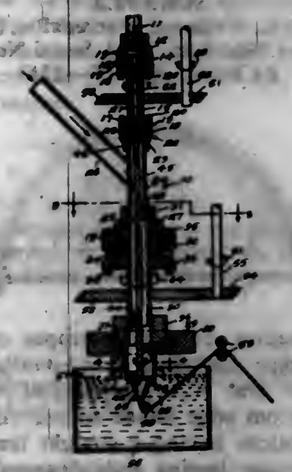
to position said roller in a retracted position upon a predetermined downward thrust upon said caster device whereby said stop moves on said tapered surface and is disengaged from said recess.

2,770,832
SWIVEL WHEEL DAMPER
Claude Martin, Buffalo, N. Y., assignor to Houdaille Industries, Inc., Detroit, Mich., a corporation of Michigan
Application February 11, 1953, Serial No. 336,240
12 Claims. (Cl. 16—35)



1. A shimmy damper installation for damping oscillations of a wheel assembly mounted in a relatively fixed support structure comprising, in combination, damping means attached to the support structure, first collar means journaled on said support structure, means operatively connecting said damping means with said collar means, second collar means journaled on said support structure and connected to oscillate with said wheel assembly, means for interconnecting said first and second collar means for joint movement within a preselected range of positions of said wheel assembly to damp oscillations of said wheel assembly, and means for disengaging said interconnecting means outside the preselected range of positions of said wheel assembly to disconnect said damping means from said wheel assembly.

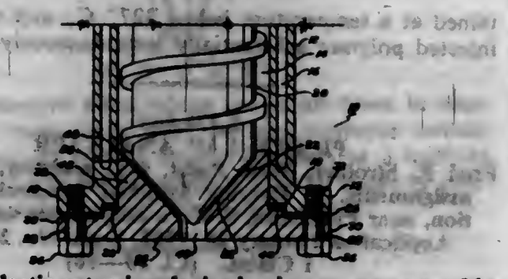
2,770,833
SEPARABLE HINGE
Fred E. Drechsel, Chicago, Ill., assignor to Ilg Electric Ventilating Co., Chicago, Ill., a corporation of Delaware
Application January 15, 1953, Serial No. 331,420
5 Claims. (Cl. 16—172)



1. A pair of cooperating hinge members comprising a first hinge member having a hook portion with a slot therein, the end of said hook portion being pointed so as to form a knife edge, a second hinge member having a vertical flange portion which includes a V-shaped notch at its base portion and an overlying hook portion, said first hinge member being interengageable with said second hinge member with said overlying hook portion of said second hinge member extending through the slot in said first hinge member and with said knife edge seating in said notch in said second hinge member, and said first hinge member being free to pivot on said knife edge relative to said second hinge member when said hinge members are interengaged.

2,770,834
CONCEALED HINGE OF SLIDABLE EXTENSIBLE TYPE
Saverio Jannace, Milan, Italy, assignor to Italo Rizzieri, Milan, Italy
Application April 30, 1951, Serial No. 223,718
Claims priority, application Italy May 4, 1950
2 Claims. (Cl. 16—179)

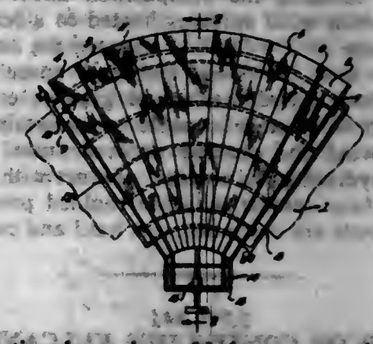
1. A hinge comprising a pair of base plates, each plate having an elongated slot provided therein, one plate having a slide of annular sector profile extending from one face of the plate in the lower portion thereof in alignment with the lower portion of said slot, the other plate having a slide of annular sector profile extending from one face thereof in alignment with the upper portion of the slot therein and above the slide extending from the first plate, an intermediate slide member of annular sector profile and of channel cross section embracing each slide and circumferentially slidably mounted thereon, and a guide body of annular sector profile, said guide body having a pair of axially spaced upper and lower parallel annular grooves formed therein and opening through annular slots in the inner surface of the body, said slots being of an axial width less than the axial width of the grooves, said guide body having the intermediate slide member embracing the slide of one plate slidably mounted in the lower groove and the intermediate slide member embracing the slide of the other plate mounted in the upper groove, said elongated slots in the plates being long and wide enough to enable the guide body and the intermediate slide members to pass therethrough during relative annular sliding motion of the slides, intermediate slide members and the guide body.



2,770,835
APPARATUS AND METHOD FOR THE MANUFACTURE OF SPUN SYNTHETIC THREADS AND/OR YARNS
Claude B. Williams, Narrows, Va.
Application March 6, 1953, Serial No. 340,885
8 Claims. (Cl. 18—8)

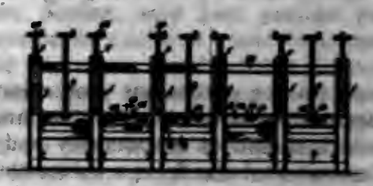
1. A process for the manufacture of spun synthetic threads and yarns, consisting in simultaneously extruding a plurality of fibers through extrusion orifices of a rotating member into a coagulating bath while intermittently and successively, at regulated intervals, interrupting the extrusion of the fibers momentarily through the different extrusion orifices for accomplishing breaks in the different filaments in regulated spaced sequence prior to coagulation thereof to produce a yarn or thread of uniform cross sectional size and which is devoid of thick and thin portions.

2,770,836
PRESSURE HEAD FOR EXTRUDERS
Ernest H. Hankey, Springfield, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
Application June 10, 1953, Serial No. 360,678
6 Claims. (Cl. 18—12)



1. In a plastic extrusion device having a screw rotatably mounted in the bore of a casing, the improvement which comprises a conical tip on the discharge end of the screw, said conical tip having a base diameter substantially equal to the root diameter of the screw and a slant height equal to less than about twice the altitude thereof, and a casing-closure member adjustably mounted on the discharge end of the casing, said casing-closure member having a cylindrical portion in the bore of the casing, the cylindrical surface of said portion being in sliding engagement with the wall of said bore, said cylindrical portion being provided at the inner end thereof with a frustro-conical recess spaced from and parallel with the conical tip of the screw, the surface of said frustro-conical recess converging with the said cylindrical surface to define a sealing lip therebetween.

2,770,837
EXTRUDING PRESS
Hans Reifenhäuser, Troisdorf, Rhineland, Germany, assignor to Hugo Stinnes Verwaltung G. m. b. H., Mulheim an der Ruhr, Germany
Application February 24, 1953, Serial No. 338,476
Claims priority, application Germany February 23, 1952
1 Claim. (Cl. 18—12)



An extruding press comprising, in combination, an elongated tubular casing having an elongated first inner cylindrical surface portion and an elongated second inner cylindrical surface portion next to said first surface portion, coaxial therewith, and of a larger diameter than the same, said casing being formed only at said first inner surface portion thereof with a plurality of relatively closely spaced axial grooves each of which has one side surface portion making approximately a right angle with a tangent to said first inner surface portion and an opposite side surface portion making an acute angle substantially smaller than a right angle with a tangent to said first inner surface portion, said one side surface portion of each groove being located next to said opposite side surface portion of the next groove, and said casing being formed with an opening in said second surface portion thereof; a worm screw coaxial with said casing turnably carried by the latter for rotation therein and having an outer helical periphery located closely adjacent to said first and second inner surface portions of said casing; and hopper means connected to said casing at said opening thereof to supply material to the interior of said casing.

2,770,838
SECTIONAL REPAIR MOLD FOR PNEUMATIC TIRES
William Cryar, Compton, Calif.
Application February 16, 1953, Serial No. 337,055
4 Claims. (Cl. 18—18)

1. A sectional repair mold for pneumatic tires comprising a plurality of substantially wedge shaped segments arranged in juxtaposition and abutting one another, a pair of frame plates arranged one on each side of the outermost segments of the mold, a stirrup on the lower end of said plates, clamp means engaging the stirrups and bearing against the pneumatic tire to hold the mold on the tire, means holding said segments in assembled position, and conduit means extending through all of said segments to heat the same, said conduit means extending from one side of the mold to the other.

2,770,839
VULCANIZING MACHINE
Lendall Orea Boice, Bluefield, W. Va.
Application September 17, 1953, Serial No. 380,690
8 Claims. (Cl. 18—18)

1. In a machine for vulcanizing repair of strip material comprising, a frame, a vulcanizing unit having top, bottom and edge heater plates fixed upon the frame longitudinally thereof, and a second vulcanizing unit having top, bottom and edge heater plates mounted upon the frame parallel to the first unit and movable transversely of the frame toward and from the fixed unit.

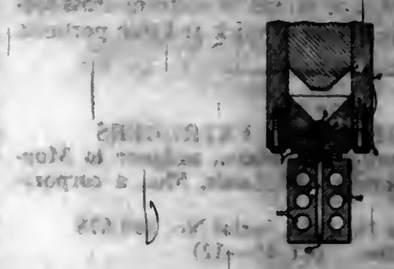
2,770,840
METHOD FOR PRODUCING MOLDED PRODUCTS COMPRISING MELAMINE FORMALDEHYDE RESIN AND GYPSUM
Lawrence P. Biefeld, Granville, and Richard F. Shannon, Lancaster, Ohio, assignors to Owens-Corning Fiberglas Corporation, Toledo, Ohio, a corporation of Delaware
No Drawing. Application April 24, 1952, Serial No. 284,201
6 Claims. (Cl. 18—47.5)

1. A method for producing molded products comprising loading a mold space with a composition consisting essentially of a water soluble melamine formaldehyde resin in an intermediate stage of polymeric growth and calcined gypsum present in the ratio of 1 part by

weight resin to 2–8 parts by weight gypsum, water in amounts greater than 16 parts by weight per 100 parts by weight of gypsum to impart flow of the desired character but not more than that theoretically required to combine with the gypsum to form a cured cement, a water soluble alkali metal salt present in amounts ranging from 0.25–4 parts by weight per 100 parts by weight of gypsum to seed the cement cure, an acidic substance to adjust the pH of the composition to between 5 and 7, a retarder for the gypsum cement, and glass fibers of reinforcing lengths present in amounts ranging from 1–20 percent by weight based upon the solids in the molding composition, molding the composition under heat and pressure between mold surfaces heated to a temperature within the range of 220–300° F. whereby the composition is caused to flow for filling the mold space until the melamine formaldehyde resin and gypsum components are advanced to a stage capable of maintaining mold shape, removing the molded product from the mold space, and hydrating the molded product with a film of water in surface contact with the molded product until said components are converted to a hard and cured stage.

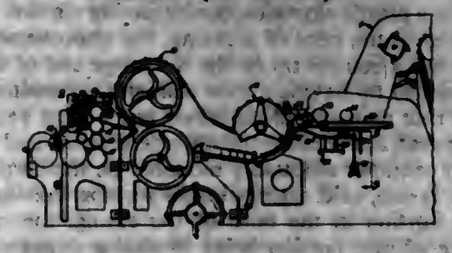
---

2,770,841
**METHOD OF CONTINUOUS VULCANIZING OF RUBBER**
Giles B. Cooke and Mordecai N. Timbs, Baltimore, Md., assignors to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York
Application September 4, 1952, Serial No. 307,868
5 Claims. (Cl. 18—53)



1. A process for the continuous production of cured tubes of vulcanizable material of precise and uniform dimensions which comprises continuously and uniformly extruding in uncured tubular form a substantially rapidly curable rubber composition, so compounded as to cure in not over about one half a minute when exposed to a temperature of 400–450° F., said extrusion being at an elevated temperature but below the curing temperature, and thereafter immediately and without pause, drawing the uncured tube through a zone maintained at a constant elevated curing temperature while in sliding internal contact with a supporting mandrel to cure the tubular article, and continuously and uniformly withdrawing the cured tubular article from the curing zone at said temperature into the open air.

---

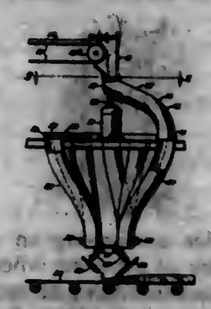


2,770,842
**INJECTION MOLDING OF POLYTETRAFLUOROETHYLENE**
Oliver M. Hahn and Robert S. Mallouk, Wilmington, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Application January 22, 1954, Serial No. 405,654
1 Claim. (Cl. 18—55)

A process for injection molding polytetrafluoroethylene which comprises the steps of heating granulated polymer to a preliminary temperature in the range of 327 to 400° C. under a pressure effective to prevent melting thereof, injecting the heated polymer into a closed mold maintained at a temperature below 327° C., and melting the injected polymer substantially instantaneously thereafter.

---

2,770,843
**PICKER LAP ANALYZER**
Fred P. Strother, West Point, Ga., assignor, by mesne assignments, to Deering Milliken Research Corporation, near Pendleton, S. C., a corporation of Delaware
Application January 26, 1952, Serial No. 268,435
1 Claim. (Cl. 19—70)



In combination with a picker machine including lap moving rolls cooperating to wind the lap at the exit of said machine, and a series of smooth calender rolls arranged in a vertical plane for rolling contact between adjacent rolls, said calender rolls being mounted adjacent said lap moving rolls and functioning to deliver calendered lap to said lap moving rolls, a plurality of pivotally mounted, yoked arms, a plurality of rollers journaled in the yokes carried by said arms adjacent one of said smooth rolls, said rollers being adapted to contact the lap on the side opposite to that contacted by said one smooth roll, spring means adapted to bias said rollers into contact with said lap, whereby said lap is pressed between one smooth roll and said rollers, a plurality of rotatable sheaves carried on the ends of said arms opposed to said yokes, a row of rotatable sheaves fixedly mounted on said picker machine equidistant from and in horizontal alignment with said sheaves carried by said arms, said fixedly mounted sheaves being in staggered relationship with the sheaves carried by said arms, a flexible member, secured at one end to said picker machine passed from one end of said row to the other successively about said fixedly mounted sheaves and the sheaves carried by said arms thereby coupling said sheaves in a zig-zag manner, and means responsive to movement of the free end of said flexible member to thereby indicate the algebraic sum of the movement of said sheaves carried by said arms.

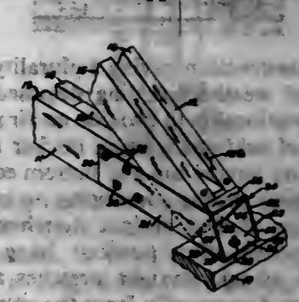
---

2,770,844
**METHOD AND MEANS FOR FELTING FIBROUS ELEMENTS**
Robert D. Lambert, Sandpoint, Idaho, assignor, by mesne assignments, to Changewood Corporation, Chicago, Ill., a corporation of Illinois
Application July 29, 1953, Serial No. 371,885
13 Claims. (Cl. 19—156)

1. A method of depositing fibrous elements upon a collecting surface to manufacture continuous layers with the fibrous elements in uniform distribution comprising the steps of advancing the said collecting surface continuously past a plurality of conveyor outlets which are positioned above and mutually aligned across said collecting surface, moving a distributor outlet uniformly to bring it successively into communication with a plurality of conveyor inlets which are at all times in communication respectively with the said conveyor outlets, and continuously feeding fibrous elements at a uniform rate into a distributor inlet which is at all times in communication with the said distributor outlet.

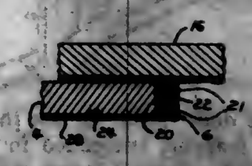
---

2,770,845
**TUBE GEAR FOR SLIVER COILERS**
Gordon C. Andersen, Biddeford, and Paul R. West, Kennebunk, Maine, assignors to Saco-Lowell Shops, Boston, Mass., a corporation of Maine
Application February 11, 1954, Serial No. 409,762
4 Claims. (Cl. 19—159)



4. In a sliver coiler, a tube gear comprising a base member mounted for rotation in a horizontal plane about a vertical axis, said base member having a first generally flat upper surface portion and having spaced from the axis of rotation thereof a second surface portion extending at an angle to said first portion and merging therewith and having also spaced from said axis of rotation thereof a generally vertical passage of circular cross section extending through said base member and through said second surface portion, and a tube member mounted in fixed position on said base member extending upwardly from the upper face of said base member and radially inwardly with its lower end opening positioned above and adjacent to said passage and its upper end positioned adjacent said axis of rotation of said base member.

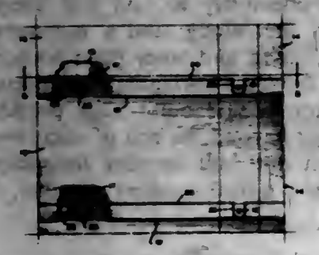
---



2,770,846
**TRUSS SHOE**
Ronald James Finelleton, Lafayette, Calif., assignor to Raybow Engineering & Research Co., Oakland, Calif., a corporation of California
Application September 29, 1951, Serial No. 248,914
11 Claims. (Cl. 20—5)

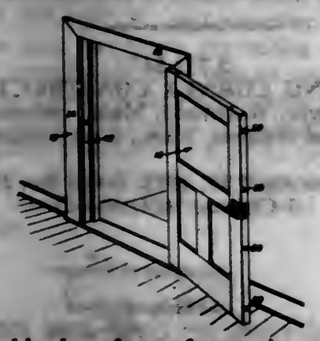
1. In a truss adapted to be secured to vertical support members and having a horizontal lower chord and a sloping upper chord whose ends lie just beyond the ends of the lower chord, the ends of said upper chord being cut off substantially perpendicularly to said upper chord, the combination therewith of a metal truss shoe at each end of said truss for securing the truss chords together and for securing said truss to said vertical support members closely adjacent the ends of said upper chord, each said shoe comprising a pair of parallel side members lying against the vertical outside faces of said lower chord and bolted to said lower chord, said members having outer portions that extend beyond the end of said lower chord, whereby the tension of said lower chord is transferred effectively to said side members substantially centrally therealong; and a transverse member in between and joining said outer plate portions, said transverse member having a horizontal base portion connecting the lower edges of said outer plate portions, having its inboard end out beyond the end of said lower chord, and having at least one bolt opening therethrough for connection to said vertical support member, which underlies substantially the entire said base portion, said transverse member also having an inclined bearing-plate portion in between said side members extending upwardly and outwardly from the inboard end of said base portion and bearing against the perpendicularly cut end of said upper chord, the end face of said upper chord being supported on the level of the lower chord in a pocket provided by said side members and said bearing-plate portion, said upper chord thrust therefore being resolved substantially centrally against said inclined bearing-plate portion, the main bearing area of said base portion on said vertical support member lying directly below said bearing-plate portion, said base portion being shorter than the area on its level that would be formed by a continuation of said upper chord, so that the point of intersection of said upper chord thrust and said lower chord tension lies directly above said vertical support member, whereby all the three forces of the truss, the upper chord thrust, the lower chord tension, and the reaction of the vertical support, are resolved concentrically in said shoe.

---



2,770,847
**BUILDING CORNER CONSTRUCTION**
William R. Wright, Westwood, Mass., assignor to Bird & Son, Inc., East Walpole, Mass., a corporation of Massachusetts
Application April 19, 1952, Serial No. 283,167
3 Claims. (Cl. 20—5)

1. A building element having a normally exposed outer edge comprising a sheet of fiberboard having an extended outer edge, a groove extending along said edge between the side surfaces of said fiberboard sheet, said groove forming webs on either side thereof, said webs being saturated with a sealing composition of asphalt, resin or the like, and coating composition of asphalt,



resin or the like in said groove and covering said outer edge for providing a substantially flush weatherproof strengthened outer edge on said building element, said edge being covered with said coating composition, and said groove providing a reservoir of said coating composition.

2,770,848
MOISTURE RELEASE AND ALIGNING DEVICE
Patrick Dolan, Richmond, Va.
Application April 28, 1953, Serial No. 351,675
9 Claims. (Cl. 20—5)

1. In a wall construction having a plurality of elongated rows of strips of weatherboarding disposed horizontally in overlapping relationship to provide an air pocket behind each row, each of said strips being thicker at the bottom than at the top and having top and bottom edges, moisture release and aligning means comprising an elongated strip of material having aligned straight stretches separated by horizontally disposed offset portions lying in the same horizontal plane as said straight stretches and a spacing portion depending downwardly from the extremity of each of said offset portions, the straight stretches resting upon the upper edge of a strip of weatherboarding and the downwardly depending spacing portions being positioned between the front face of said strip of weatherboarding and the overlapping portion of the next higher strip of weatherboarding to provide elongated spaces between the overlapped portions of said strips of weatherboarding furnishing communication between the atmosphere and the air pocket behind said next higher strip of weatherboarding, the bottom edge of said next higher strip of weatherboarding being located in alignment with the extremities of said spacing portions to align said strip of weatherboarding horizontally and control the degree of overlap.

2,770,849
VARIABLE DOOR FRAME
Warren A. Gavey, Orfordville, Wis.
Application March 2, 1954, Serial No. 413,505
6 Claims. (Cl. 20—11)

1. A variable door frame for use in combination with a door having magnets embedded in one edge thereof, said frame having a vertical frame member with a vertically extending slot therein, a vertical member of substantially U-shape in cross section resiliently mounted in said slot, resilient means urging said vertical member into said slot, said magnets attracting said vertical member into engagement with said edge of said door when said door is closed.

2,770,850
CURVED CLOSURE DEVICE
Phillip Graham, Pittsburgh, Pa.
Application January 8, 1952, Serial No. 265,465
14 Claims. (Cl. 20—35)

1. A closure device comprising an outwardly curved thin panel, a plurality of elements whose extremities are fastened adjacent the extremities of said panel on opposite sides thereof, and a plurality of ribs, each having spaced anchoring points secured to one side of said panel there being spaces between said ribs and said one side of the panel, between said anchoring points, for allowing said panel to freely expand or contract at intermediate unfastened portions between said anchoring points.

2,770,851
POSITIVE LATCH FOR AWNING TYPE WINDOWS
Arthur H. Soule, Beverly Hills, Calif., assignor to Dalmo Continental, Inc., Los Angeles, Calif., a corporation of California
Application September 2, 1954, Serial No. 453,803
6 Claims. (Cl. 20—42)

1. A latch mechanism for the upper sashes of a multiple sash window construction having a vertically movable traveling bar for actuating said sashes for opening and closing movement thereof, a pivotal connection between the upper portion of said sashes and said traveling bar, said connection including a bracket on said traveling bar, a vertically extending slot in said bracket, an outwardly extending pin on the upper end of said sash extending through said slot thereby providing a lost motion mechanism to permit initial downward movement of said traveling bar relative to said upper sashes without causing opening movement thereof, said latch comprising means connected to the lower portion of the side edges of each of said upper sashes and extending outwardly therefrom, means connected with said traveling bar and adapted to interengage with said first means to prevent opening movement of said upper sashes when said traveling bar is in its uppermost position and adapted to disengage from said first means upon initial downward movement of said traveling bar relative to said upper sashes to permit opening movement of said upper sashes upon further downward movement of said traveling bar.

2,770,852
COMBINATION AWNING AND SHUTTER FOR WINDOW OPENING
Roland D. Goodwin, Lakewood, Ohio
Application March 30, 1954, Serial No. 419,706
1 Claim. (Cl. 20—57.5)

A combination awning and shutter for a window opening, comprising in combination, a tubular rail member having laterally extending center and end brackets for securing said rail above the window opening in spaced relation thereto; two similar frame members pivotally and slidably suspended from said rail between the center brackets and each end bracket thereof, each of the frame members comprising spaced and parallel side bars, joined at their lower ends by an angle iron cross bar, each of said side bars being curved upon itself at its upper end to form a tubular shoe adapted to slidably engage the tubular rail, and a plurality of transversely extending and overlapping louvers tiltably mounted on said side bars, including means for simultaneously tilting and holding the louvers in adjusted position; each of said cross bars having a notched lock strap pivotally mounted thereon, movable between a retracted position against the cross bar to an extended position wherein its notched portion extends beyond the end of the cross bar, and a lock pin mounted on the cross bar in spaced alignment with the pivot point of the lock strap; said frames being slidable of the rail between a first position wherein they are positioned against the end bracket thereof, clear of the window opening and at either side thereof in the manner of a shutter, and a second position wherein said frames abut the center brackets to cover the window opening with their cross bars abutting and with the lock straps extended so that the notches therein engage the lock pins of the abutting cross bars to secure the frames against lateral separation; and means for pivoting and holding the locked frames at an angle to the window opening in the manner of an awning.

2,770,853
LOUVERED WINDOW FRAME
Dana M. Groff and Charles S. Stanley, Tampa, Fla.; said Stanley assignor to said Groff
Application March 3, 1954, Serial No. 413,836
7 Claims. (Cl. 20—62)

1. In combination a window frame having parallel side walls with rear edge portions reversely bent upon themselves and providing spaced substantially parallel forward extending walls, a series of louvers between said side walls, supports for said louvers at the ends of the same, each support comprising a holder with front, rear, top, bottom and end portions for receiving the end of the louver and rearwardly extending spaced wall portions, and means pivotally mounting said holder through the upper part of said end portion so that the spaced wall portions will be disposed on opposite sides of the wall formed by the adjacent reversely bent portion of the side of the frame and providing a weather-tight joint.

2,770,854
INCENSE BRIQUETTE
Victor J. Mianulis, Chicago, Ill., assignor to Hinde Incense Mfg. Co., Chicago, Ill., a corporation of Illinois
Application December 4, 1952, Serial No. 323,969
2 Claims. (Cl. 21—116)

1. A conically-shaped briquette of neutral carbon impregnated with incense ingredients volatilizable at elevated temperatures, a central portion of said briquette formed with a longitudinally-extending cavity of substantial dimension opening to the base of the same, upon ignition of the briquette said cavity adapted to conduct the volatile products of combustion into the atmosphere, a substantial portion of said volatile products of combustion being released into the atmosphere at points sufficiently removed from the ignited portions of the briquette to prevent the reabsorption and recombustion thereof, said base having a transverse open slot extending diametrically across the same.

2,770,855
APPARATUS FOR MAKING LINER SLEEVES AND REFRACTORY SHELL TYPE MOLDS
Garnet P. Phillips, La Grange, Ill., assignor to International Harvester Company, a corporation of New Jersey
Application November 14, 1952, Serial No. 320,417
8 Claims. (Cl. 22—9)

7. A foundry mold manufacturing apparatus comprising a cylindrical casing having upper and lower open ends, upper and lower pattern sections respectively connected over the upper and lower open ends of said casing, the upper pattern sections having openings providing for communication with the interior of the casing, a tubular member connected to one of said pattern sections, said tubular member projecting into said casing, a sleeve connected to the other pattern section, said sleeve and said tubular member being disposed in relative telescoping and laterally spaced relation to provide first and second

concentric chambers, one of said pattern sections including a post substantially coextensive within said tubular member to provide a third chamber in communication with said openings, and means adapted to direct mold material through said openings into said chamber, said first and second pattern sections being relatively displaceable from the mold material thereby leaving a cylindrical shell-type mold in said casing.

2,770,856

## CRUCIBLE AND STOPPER THEREFOR

Adam W. Becher, Oxford, Ohio, and Alfred W. Woker, St. Louis, Mo., assignors to the United States of America as represented by the United States Atomic Energy Commission

Application December 4, 1952, Serial No. 324,021
6 Claims. (Cl. 22—57)

1. The combination with a crucible having a hole in its bottom, of a frangible stopper mounted in the crucible hole so as to protrude from the bottom of the crucible, the stopper having a blind bore extending from an upper end within the crucible to a region spaced from the lower end and near the bottom of the crucible and an annular notch around the body in a plane substantially normal to the bore and around the bottom of the bore, and a slide member having two spaced openings, one opening being provided with a shoulder, and means supporting the slide member adjacent the bottom of the crucible with the protruding end of the stopper in the shoulder opening whereby the slide member may be shifted to convert the stopper to a nozzle by breaking the said protruding end from the stopper at the annular notch and to carry said protruding end out of the way on the shoulder of the one opening and bring the other opening into alignment with the nozzle.

2. The combination with a crucible having a hole in its bottom, of a stopper composed of a nozzle portion positioned in the hole, a cap protruding from the bottom and a frangible section between the cap and the nozzle portion, and a slide member mounted at the bottom so as to be shiftable therealong for breaking the stopper at the frangible section and taking the cap out of the way to facilitate unimpeded flow from the crucible through the nozzle portion.

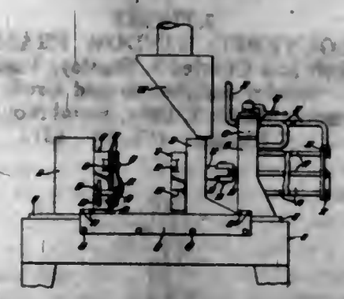
2,770,857

## MOULD FOR THE CENTRIFUGAL CASTING OF PIPES AND OTHER PIECES

Pierre Boisseau, Pamiers, France, assignor to Societe Metallurgique Ariegeoise et Lorraine, Pamiers, France, a French body corporate

Application April 28, 1953, Serial No. 349,695
Claims priority, application France April 21, 1952
7 Claims. (Cl. 22—65)

1. In a mould rotative about an axis of revolution, for the centrifugal casting of an elongated metallic tubular piece with protection against atmospheric air, said piece being susceptible of undergoing a relatively important longitudinal shrinkage, in combination: a rotative tubular mould shell having two ends and an internal surface concentric to said axis, said internal surface emerging at both of said ends and forming a casting chamber; a hollow distributor chamber attached to one of said ends; said distributor chamber forming a passageway for the molten metal to be cast, and being adapted to impart to the molten metal an angular speed of rotation equal to that of said shell before the metal passes from said distributor chamber into said casting chamber; a first transverse plug device, internal to said internal surface comprising a screen disposed between and separating said casting chamber and said distributor chamber; apertures in said screen for the passage of the molten metal and for communication between said chambers, said apertures being so disposed that they are entirely immersed in the molten metal; housing means for said screen, attached to said shell between said distributor and casting chambers, and fusible means disposed between said housing means and the periphery of said screen and adapted to connect temporarily said screen to said housing means, in such a maner that said screen is released at the end of the casting; whereby said screen, then held fast, relative to the cast piece, by the metal frozen in said apertures, is adapted to follow during the cooling of the cast piece the shrinkage of the latter; at the other end of the shell, a second transverse plug device, at least partially movable to close the casting chamber, and a pushing device operable from the outside of said shell and adapted to move said second plug device longitudinally towards said screen during the cooling of the cast piece, whereby the latter is maintained under longitudinal compression in spite of its shrinkage.



---

2,770,858

## SUPPORTING SHELL MOLDS DURING METAL POURING OPERATIONS

Arthur J. Anderson, Bedford, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application April 12, 1952, Serial No. 282,030
2 Claims. (Cl. 22—90)

1. An assembly of a shell mold and support therefor for use during metal pouring operations, said assembly comprising a base, a pair of mold-supporting plates mounted on said base, each of said plates being provided with a plurality of spatially separated projections of varying longitudinal extension with respect to the plane of said plate, a thin-walled shell mold formed of sand and thermosetting resin binder mounted on one of said plates against the projections on said plate, at least one of said plates being reciprocably mounted on said base and movable relative to the other of said plates so as to cause the projections on said plates to apply pressure to opposite exterior surfaces of said mold supported between said plates, and means associated with the plate on which said mold is mounted for maintaining said mold in position against the projections on said plate prior to contact between the other of said plates and said mold.

---

2,770,859

## METHOD OF TREATING A METALLIC PATTERN FOR SHELL MOLDING

Donald J. Henry, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

No Drawing. Application July 20, 1951, Serial No. 237,825
7 Claims. (Cl. 22—193)

1. A method of treating a metallic pattern for effecting the release of a shell-type and sand-resin mold therefrom which comprises heating said pattern to at least 250° F. and coating the molding surface of said hot metallic pattern with a mixture of minor proportions of carnauba wax and emulsifier and a major proportion of water for distributing said wax on said molding surface.

---

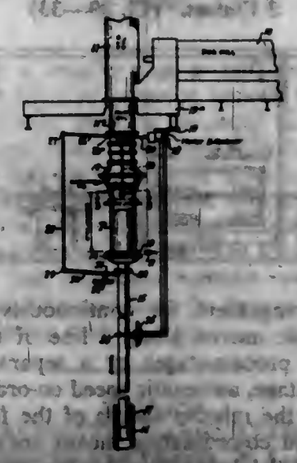
2,770,860

## CASTING READILY OXIDIZABLE ALLOYS

Fred J. Webbere, Royal Oak, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

No Drawing. Application July 23, 1952, Serial No. 300,512
7 Claims. (Cl. 22—214)

6. A method of treating a nickel base alloy containing titanium and aluminum during pouring operations so as to prevent the formation and occlusion of titanium and aluminum nitride and oxide films, said method comprising melting said nickel base alloy and pouring it in an atmosphere consisting essentially of a mixture of an inert gas and dichlorodifluoromethane.



---

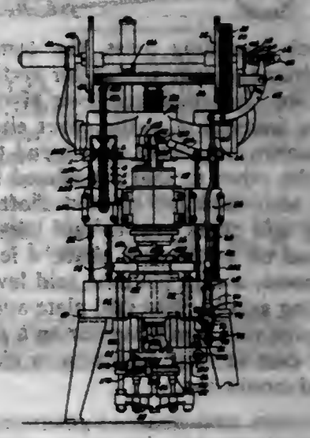
2,770,861

## APPARATUS FOR FORMING CYLINDERS OF PLASTIC MATERIAL

John D. Schlumm, Findlay, Ohio, assignor to The Hancock Brick and Tile Company, Findlay, Ohio, a corporation of Ohio

Application September 16, 1952, Serial No. 309,799
7 Claims. (Cl. 25—39)

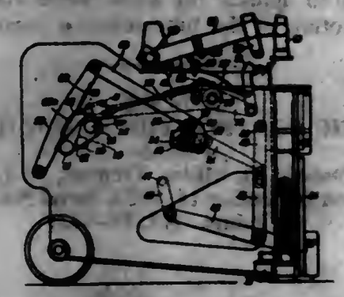
1. Apparatus of the character described, comprising means for vertically forming a continuous tube of plastic clay-like material, support means for the lower end of the tube, means including said support means for up and down movement, said support means moving downwardly as the tube advances, normally inactive tube severing means, means mounting said severing means for up and down movement, mechanism for imparting limited downward movement to said tube severing means, and means responsive to predetermined downward movement of said support means for activating the tube severing means and substantially simultaneously actuating the mechanism so as to impart limited downward movement of the severing mechanism, the last named means operating so as to actuate the knife while continuing the downward motion of the tube severing means and tube.



---

2,770,862

## AUTOMATIC CONTROL FOR SCREW OPERATED PRESS

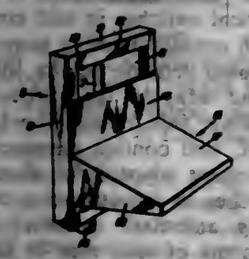


Donald M. Miller, Trenton, N. J.

Application December 14, 1953, Serial No. 397,895
5 Claims. (Cl. 25—42)

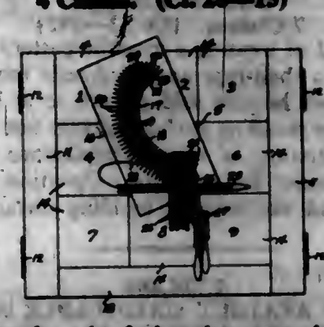
1. In a screw operated press of the type including a base, a pair of power driven horizontally shiftable friction disks journaled on said base, a horizontally arranged friction wheel mounted on said base between the opposed faces of said disks and carrying an axially aligned screw threadedly mounted in said base for rotary and reciprocal axial movement therein, said screw carrying a ram, a tile forming die member on said base axially opposed to said ram, means for supplying clay dust to said die member, a plurality of mechanical elements connected in series with and adapted for alternately shifting said friction disks into and out of contact with the periphery of said fraction wheel to effect reciprocal movement of said screw and ram, an air pressure cylinder mounted on said base and having therein a piston connected with and adapted for actuating said mechanical elements in shifting said disks, as aforesaid, automatic control for the axial movements of said screw and ram comprising in combination an electrical circuit, a source of electric current therefor, an electrically actuated valve in the electrical circuit connected with said air pressure cylinder for controlling the movements of the piston therein, a sequence relay in said circuit for sequentially controlling the operation of said electrically actuated valve, a plurality of electrical switches in said circuit mounted on said base, a switch contact member movably mounted on said base in opposed relation to the lower side of said friction wheel and adapted for vertical movement by contact with the lower side of said wheel upon downward movement thereof, said contact member being provided with a contact element adapted for alternately actuating each of said switches in the operation of said relay and valve in effecting automatic predetermined reciprocal sequential movements of said ram in the operations of pressing a supply of clay dust in said die member into a tile, and resilient means mounted on said base and engaging said contact member for automatically returning said member to its uppermost position when said friction wheel moves to its uppermost position.

2,770,863
**PRESSES FOR MOULDING PLASTIC SUBSTANCES**
William Herbert Smith, East Molesey, England
Original application December 18, 1951, Serial No. 262,257, now Patent No. 2,716,796, dated September 6, 1955. Divided and this application January 13, 1953, Serial No. 330,944
5 Claims. (Cl. 25—83)



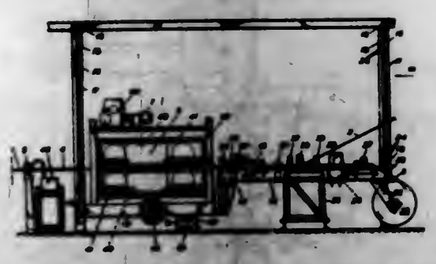
1. In a block moulding press, the combination of a mould box, a frame, a ram guided for vertical movement in said mould box, an articulated lever pivoted at one end to the machine frame and at the other end to said ram, a toggle mechanism connected at one end to the machine frame and at the other to said articulated lever, a rotary shaft, a crank arm mounted on said shaft, a connecting rod connecting said crank arm to said toggle mechanism, a plate mounted on said rotary shaft, a lever pivoted to the machine frame, a cam plate on said lever, link mechanism connecting said lever to said plate and a rotary cam adapted to engage said cam plate during a partial rotation of said rotary cam to raise said ram to eject a moulded block from said mould box.

2,770,864
**METHOD FOR PRODUCING A SURFACE OF DESIRED CONTOUR ON A MOLDABLE SUBSTANCE**
Harry Weese, Chicago, Ill.
Application December 10, 1952, Serial No. 325,099
1 Claim. (Cl. 25—155)



A method for producing a plane surface on structures made of self-rising concrete which comprises pouring the concrete into a mold, allowing the concrete to rise and extrude through a plane perforated surface, wiping the extrusions, redistributing the extruded concrete to hollow places and removing excess concrete.

2,770,865
**EMBALMER'S ARM SUPPORT**
Larry D. Krouch, Nampa, Idaho
Application January 20, 1955, Serial No. 483,029
1 Claim. (Cl. 27—21)



An embalmer's arm support comprising: a substantially flat, rectangular upright including a back having a slot therein, side walls, a top, a bottom having a drainage opening therein, and a front having an opening therein, feet depending from the bottom for supporting the upright in an elevated position, and a bracket mounted for vertical sliding and rotary adjustment on the upright, said bracket including a vertical plate engaged with the front of the upright, a platform fixed on said plate and projecting horizontally therefrom, a bolt fixed on the bracket and extending through the opening in the front and the slot, and a hand nut threaded on the bolt for frictionally securing the bracket in adjusted position on the upright.

2,770,866
**PIN-UP BOARD**
Marguerite G. Brooks, Darien, Conn.
Application May 24, 1954, Serial No. 431,650
4 Claims. (Cl. 28—15)

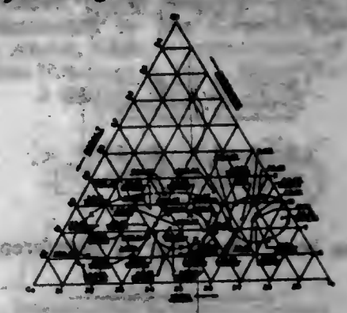
1. A pin-up board of the character described comprising a base portion and an upper portion on top of the base portion, said upper portion comprising elongated sections secured to the base portion at its opposite side and lower edges forming a central open rectangular space, a series of rectangular blocks on the base portion side by side in said open space and unattached to the base so they may be shifted to different relative positions in said space, and said blocks being of a material adapted for ready insertion of pins to facilitate pinning a pattern to the upper surface thereof.

2,770,867
**ARRANGEMENTS FOR CARRYING OUT CONTINUOUS PROCESSES ON LONG RIGID ARTICLES**
James Arthur Spencer, Northumberland Heath, Erith, England, assignor to British Insulated Callender's Cables Limited, London, England, a British company
Application November 17, 1951, Serial No. 256,946
Claims priority, application Great Britain December 1, 1950
3 Claims. (Cl. 29—33)

1. In an arrangement for continuously processing a long rigid article moved along a line of travel through two successive process-stages by a separate forwarding device in each stage, automatic speed co-ordinating means for controlling the relative speeds of the forwarding devices, said speed co-ordinating means comprising a carriage for one of the forwarding devices, suspending members supporting the carriage from fixed supports, centralizing springs incorporated in the suspending members, the springs being adapted to centralize the carriage and the suspending members being adapted to permit displacement of the carriage from the central position in the said line of travel under the action of tension and compression forces set up in the article between the two stages against the centralizing springs, a speed regulator for one of said forwarding devices, and control means for said speed regulator, said control means being adapted for operation by displacement of the carriage to adjust the speed regulator in the sense required to correct the condition which has caused the displacement.

2,770,868
**SELF LOCKING ROLLER, TIRE, AND TREAD FOUNDATION**
John G. Streckfus and Harry Godwin, Baltimore, Md.
Application July 2, 1952, Serial No. 296,840
3 Claims. (Cl. 29—129)

1. In a device of the kind described, a foundation having a longitudinal axis and a circular cross-section normal to said axis, said foundation having slots on the periphery thereof, a resilient tread peripherally secured to said foundation, and straps separate and independent from the foundation and extending longitudinally and internally of said tread and longitudinally and externally of said foundation, said straps being attached to the outer face of the foundation and directly abutting the foundation of said straps preventing the disengagement of the tread from the slots.



2,770,869
**METHOD OF MAKING ROLLER BEARING CAGE**
William J. Harley, Milwaukee, Wis., assignor to Harley-Davidson Motor Co., Milwaukee, Wis., a corporation of Wisconsin
Application December 21, 1953, Serial No. 399,529
8 Claims. (Cl. 29—148.4)

1. A method of bearing cage manufacture which comprises pre-fabrication of separate annuli, at least one of which is sufficiently thick in its axial dimension solely to provide dividers between bearing pockets, radially milling pockets in the last mentioned annulus, leaving portions of such annulus to constitute said dividers between successive pockets, the other annulus comprising a ring having a continuous annular face, and securing said other annulus to the last mentioned annulus with the ends of said dividers abutting said face, the face portions between said dividers closing such pockets.

2,770,870
**THERMOSENSITIVE LAMINATED METALS**
Victor G. Mocarski, East Orange, N. J., assignor to The H. A. Wilson Company, Newark, N. J., a corporation of New Jersey
Application May 31, 1952, Serial No. 290,963
7 Claims. (Cl. 29—195.5)

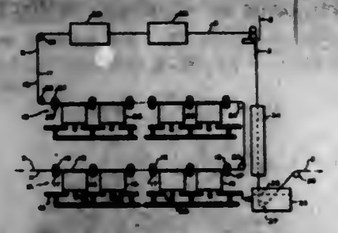
1. Thermosensitive laminated metal in which a layer of metal of relatively low coefficient of thermal expansion consisting essentially of 55½% to 61% cobalt, 8% to 10½% chromium, and 30½% to 35½% is bonded to a layer of metal of relatively high coefficient of thermal expansion, the coefficient of thermal expansion of said low expanding layer being substantially unaffected by small

variations in the degree of cold working and by variations up to about ¼% in the amount of any of the above specified ingredients.

2,770,871
**FILLER METAL PIECE FOR THE WELDING OF SPHEROIDAL GRAPHITE CAST IRON**
Roger Demalander, Pont-a-Mousson, France, assignor to The Compagnie de Pont-a-Mousson, Nancy, France, a French body corporate
Application March 9, 1953, Serial No. 341,043
Claims priority, application France March 12, 1952
8 Claims. (Cl. 29—196.1)

8. A unit comprising two cast iron members united by welding, the cast iron of said members comprising spheroidal particles of graphite and the weld deposit comprising cast iron in which the carbon is grouped in the form of uniformly distributed spheroidal particles of graphite, the micrographs of the cast iron of said deposit being identical to those of said members, said cast iron members having the following approximate composition by weight, in addition to the iron:

| | Percent |
|---|---|
| Total carbon | 3.52 |
| Silicon | 2.94 |
| Manganese | 0.34 |
| Phosphorus | 0.10 |
| Sulphur | 0.008 |
| Magnesium | 0.065 |



whereas the weld deposit has the following approximate composition by weight in addition to the iron:

| | Percent |
|---|---|
| Total carbon | 3.49 |
| Silicon | 3.02 |
| Manganese | 0.27 |
| Phosphorus | 0.07 |
| Sulphur | 0.004 |
| Magnesium | 0.08 |

2,770,872
**MARKED ELECTROLYTIC TINPLATE AND METHOD FOR PRODUCING SAME**
Alfred E. Kadell, Steubenville, Ohio, assignor to National Steel Corporation, a corporation of Delaware
Application April 10, 1952, Serial No. 281,574
28 Claims. (Cl. 29—196.4)

24. Electrolytic sheet tinplate having on at least one side a coating of electroplated tin in the flow brightened condition, the tin coating having a marking zone on the surface covering less than the entire surface area of the tin coating, the physical condition of the surface of the tin coating in the marking zone being different from and characterized by visibly different light-reflecting charac-

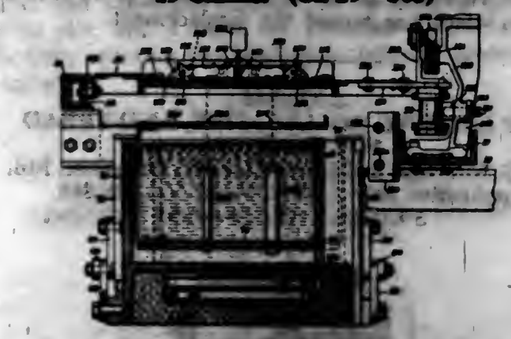
aristics than the surface of the tin coating outside of the marking zone, the physical condition of the surface of the

marking zone being the result of interference with flow brightening.

---

2,770,873
**DEVICE FOR FACILITATING MOUNTING AUTOMOBILE WHEELS**
Robert C. Ramsey, Oklahoma City, Okla.
Application February 26, 1953, Serial No. 339,195
1 Claim. (Cl. 29—273)
(Granted under Title 35, U. S. Code (1952), sec. 266)

A device for facilitating mounting of automobile wheels comprising: a handle having a pair of transverse parallel holes; a length of flexible cable slidably extending through each hole and adapted to pass through the mounting holes of an automobile wheel; a female threaded member secured at one end of each of said cables and a male threaded member secured at the other end of each of said cables, both male threaded members being on the same side of the handle and each pair of male and female threaded members having the same thread direction, the threaded members being larger than the holes in the handle whereby when said threaded members are secured to the ends of the cables a unitary structure is obtained in which sliding movement of the handle is restricted to between the ends of the cables, said threaded members being adapted to be secured to a wheel hub in place of those normally used to secure the wheel to the hub.

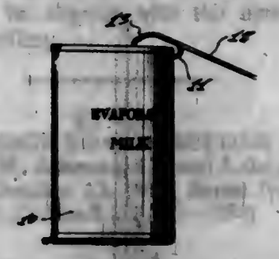


---

2,770,874
**METHOD OF LOCALLY EXPANDING TUBING**
Arthur L. Lindow, Macedonia, Ohio, assignor to The Cleveland Pneumatic Tool Company, Cleveland, Ohio, a corporation of Ohio
Application April 27, 1953, Serial No. 351,412
2 Claims. (Cl. 29—421)

1. The method of forming local expansion of tubing consisting of filling the portion of the tubing to be expanded with molten metal having a melting point lower than that of the tubing, causing said molten metal to flow radially outward to expand said tubing by applying equal opposed pressure thereon through two opposed plungers slidable in said tubing and forming therewith a slight clearance surrounded by walls colder than the melting point of said metal while confining the tubing around said plunger to maintain the slight clearance, said clearance being filled by said pressurized molten metal which solidifies therein to arrest escape of molten metal therethrough.

2,770,875
**SOLDERING MACHINE**
Jack J. Zimmerman, Riverside, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois
Application June 9, 1952, Serial No. 292,424
19 Claims. (Cl. 29—583)

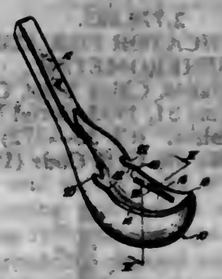


1. A machine for applying solder to parts of the surface of a printed circuit panel which comprises a thin flat insulated panel having a plurality of thin metal conductors secured thereon and substantially flush therewith and having a plurality of holes with metal therein, said machine including a container for molten solder, conveyor means having supporting portions for each of a plurality of insulated panels and movable intermittently to position successive ones of said supporting portions and the panel carried thereon horizontally over said container, solder-carrying means positioned within said container and movable vertically to carry the solder into soldering contact with a panel supported thereover, elevator means supporting said solder-carrying means for movement from a lower position below the level of solder in said container to an upper position adjacent to the underside of the panel, said solder-carrying means having a plurality of rims defining a selected solder surface configuration such that the solder contacts selected portions of the panel, and means to move said elevator means progressively upward to position said solder-carrying means adjacent the underside of a printed circuit panel positioned thereover with the solder in contact with the metal conductors thereon while maintaining a convex upwardly extending solder surface on said solder-carrying means.

4. The method of contact soldering selected metal portions on a printed circuit panel comprising a thin insulated panel with a circuit pattern of thin metal conductors on a side thereof, which includes the steps of providing a solder-carrying means having a shape operable to support solder for selective application to selected portions of a printed circuit panel, moving said solder-carrying means upwardly from below the surface of a quantity of molten solder to form at least one convex solder meniscus supported on and projecting above said solder-carrying means and to move said meniscus toward the underside of said panel, decelerating the upward movement of said solder-carrying means after it emerges from the molten solder so as to prevent destruction of said solder meniscus, and thereafter completely arresting the movement of said solder-carrying means in a position adjacent the underside of the panel and with said solder meniscus in contact with selected metal portions on the underside of the panel.

---

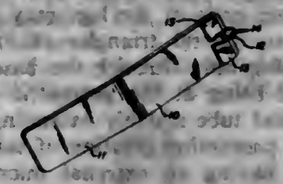
2,770,876
**CAN OPENER AID**
Murray Tabakman, Bronx, N. Y.
Application July 30, 1954, Serial No. 446,938
4 Claims. (Cl. 30—10)



1. An article of the class described comprising a substantially L-shaped flat bar having a horizontal and a vertical portion adapted to receive thereagainst the bottom and sides of a rimless can, the outside of said vertical arm near the upper end thereof being formed with a ledge adapted to receive thereunder the hook of a conventional can opener, said horizontal and vertical arms being of different length whereby to adopt the device by

inverting the same to both short and tall cans, said horizontal arm on the outside thereof near the free end thereof being provided with a ledge adapted to receive thereunder the depending hook of a can opener.

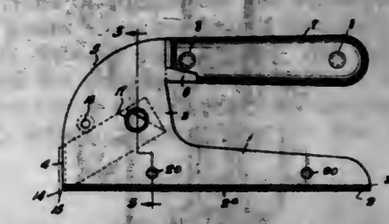
---



2,770,877
**COMBINATION CAN OPENER AND MEASURING CUP**
Alyce L. Bird, Mission, Kans.
Application September 15, 1955, Serial No. 534,565
2 Claims. (Cl. 30—123)

1. A combination can opener and measuring cup comprising a hollow, substantially semi-ovoidal bowl provided with a handle at one end thereof and a pair of concave cutting edges converging toward the opposite end of the bowl and terminating in a can-piercing point.

---



2,770,878
**GOUGING TOOL**
George D. Rosenberger, Youngstown, Ohio
Application April 27, 1954, Serial No. 426,001
1 Claim. (Cl. 30—280)

A tool for gouging an undercut channel in a plaster wall comprising an elongated metal plate, a portion of which is disposed at an angle to the remainder thereof so as to form a handle, a cutter comprising a section of thin flat metal having a U-shaped portion intermediate its ends, said ends being outturned and disposed on a common plane, the arms of said U-shaped portion positioned in converging relation to one another so that the area therebetween is greater at the base of the U-shape than at the ends of the arms of said U-shape, the ends of said cutter secured to the bottom surface of said metal plate adjacent the end thereof opposite said angularly disposed portion so that said U-shaped portion of said cutter is offset with respect to said metal plate, the opposite edges of said U-shaped portion of said cutter being sharpened.

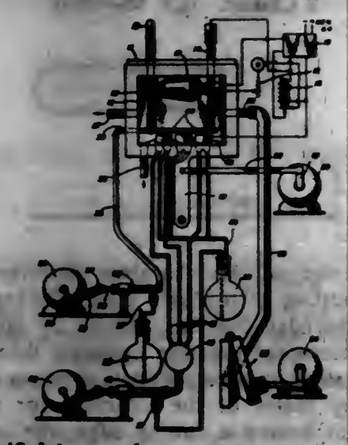
2,770,879
**COMBINED PRESSING, CREASING, AND CUTTING TOOL FOR SEMI-FLEXIBLE MATERIAL**
Malcolm Seymour, North Andover, Mass., assignor, by mesne assignments, to The General Tire & Rubber Company, Akron, Ohio, a corporation of Ohio
Application February 4, 1953, Serial No. 335,138
2 Claims. (Cl. 30—293)

2. In a device of the character described, a body formed of abutting plates, said plates having elongated bottom straight edge portions defined by angular faces forming uninterrupted creasing elements throughout the length of the straight edge portions, a recess formed between abutting plates of the structure for receiving a cutting element having a cutting edge, the cutting edge of the cutting element lying at an angle to the straight edge portions of the body and in a medial plane therewith, means for adjusting the cutting element for projection below the straight edge, means securing the plates together at their upper and lower marginal edge portions, and manual means for clamping the plates together adjacent said cutting element, whereby said cutting element may be secured in adjusted position.

---

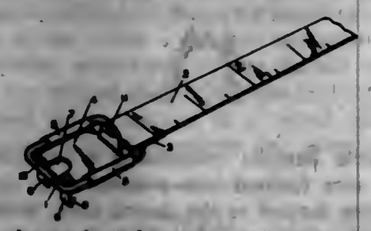
2,770,880
**FLEXIBLE DENTURE**
Ed C. Sherred, Bishop, Calif.
Application January 17, 1955, Serial No. 482,090
4 Claims. (Cl. 32—2)

1. A flexible denture comprising a resilient, flexible spring steel wire formed into a substantial dental arch, said wire being shaped to the dental arch, artificial teeth having aligned apertures through their anterior-posterior minor axes, said wire extending through said aligned apertures in said artificial teeth, and a flexible base material covering all exposed portions of said wire and the base of said artificial teeth, and forming the denture saddle.



---

2,770,881
**PROSTHETIC DENTURE STABILIZER MEANS**
Emilio Lodi, Bologna, Italy, assignor of one-half to Paul Giacobbe, Medford, Mass.
Application November 24, 1954, Serial No. 471,044
10 Claims. (Cl. 32—4)



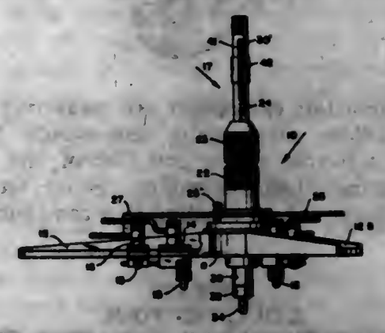
1. A prosthetic denture pair including an upper denture, a lower denture, stabilizer means for securing the upper and lower dentures in hinged relationship, said stabilizer means comprising pairs of opposed hinged spring elements embedded in the dentures and constructed and arranged to normally force the dentures apart from one another.

2,770,882
ARTIFICIAL MOUTH APPARATUS
Bernard A. Yocke, Great Lakes, Ill., William J. Carter, Kansas City, Mo., and Walter L. White, Aurora, Ill.
Application June 29, 1955, Serial No. 519,011
6 Claims. (Cl. 32—71)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. An artificial mouth apparatus comprising an enclosed chamber for mounting teeth therein, means for controlling the temperature within said chamber, means associated with the mounted teeth for circulating a physiological solution therethrough, means for maintaining a predetermined level of salivary fluid within said chamber in contact with the mounted teeth, breathing means for said chamber, and means for oscillating the chamber within a restricted arc of motion.

2,770,883
END TERMINALS FOR TAPE LINES
Floyd Hackney, Portland, Oreg.
Application April 5, 1955, Serial No. 499,320
3 Claims. (Cl. 33—137)

1. An end terminal for a tape line comprising a substantially rectangular loop member for attachment to one end of the tape, a plate having rolled side edges slidably and frictionally embracing the opposite sides of the loop member, fingers projecting downwardly from one edge of the plate below the loop member and an upturned ear projecting upwardly from the other edge of the plate for moving the plate forward and backward on the loop member, thereby sliding the fingers forwardly or rearwardly of the front branch of the loop member.

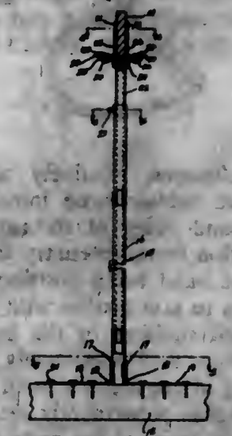


2,770,884
MEASURING INSTRUMENT
Joseph F. Eckert, North Charleston, and Aloysius L. Szymanski, Charleston, S. C.
Application August 3, 1953, Serial No. 371,963
1 Claim. (Cl. 33—150)

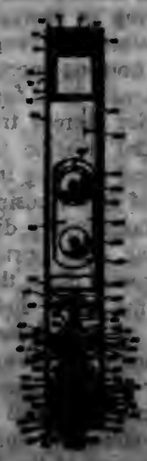
In a measuring instrument, a pair of side-by-side arms having measuring means on corresponding ends thereof and ruling pens on the other ends, said arms having longitudinal slots therein, and means pivotally connecting said arms together intermediate their ends comprising a pair of rectangular slide plates opposed to said arms and having corner legs theron extending at right angles therefrom and straddling said arms, a pair of slide blocks in said slots with which said slide plates are engaged, a pivot spindle extending through said plates and slide blocks and connecting said plates and blocks, a nut on one end of the spindle, a rectangular bowed leaf spring

opposed to one side plate between said nut and plate, and keeper lugs extending from said one plate at a right angle thereto and at opposite sides of said spring to prevent said spring from turning on said one plate.

2,770,885
CONTACT INDICATOR FOR ADJUSTABLE SPHEROMETER
Joe M. Magee, China Lake, Calif.
Application August 31, 1953, Serial No. 377,741
3 Claims. (Cl. 33—172)
(Granted under Title 35, U. S. Code (1952), sec. 266)

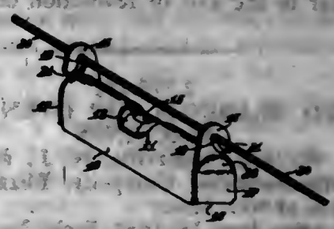


1. A spherometer comprising a generally horizontal base member having three equiangularly spaced outwardly directed arms, a downwardly supporting leg carried by each arm mounted for adjustment therealong, whereby the lower ends of the legs may be disposed at the corners of equilateral triangles of various sizes, a vertically extending bore through the base member, the axis of the bore being at the geometric center of said triangles, a vertical tube slidably extending through said bore, means for preventing rotation of said tube in said bore, said tube having an external micrometer thread thereon, a sleeve surrounding said tube having an internal thread engaging said external thread, means mounting said sleeve on said base member for rotation relative thereto and for preventing axial movement of said sleeve in a direction of the axis of said bore, a circular plate mounted for rotation with said sleeve having equiangularly spaced fine micrometer graduations thereon adapted to be aligned with a stationary pointer, a capillary disposed within said tube affixed to and communicating with a bellows disposed adjacent its lower end, liquid filling said bellows and partially filling said capillary, a pilot pin slidably carried by said tube at the lower end thereof, one end of said pin adapted to abut the lower end of the belolws and the other end to contact a surface upon which the lower ends of said legs are adapted to abut, means for limiting axial movement of said pin to prevent



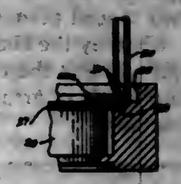
application of pressure to said bellows sufficient to rupture same, said tube being apertured to permit viewing of the upper end of the liquid in said capillary, and an axially slidable member carried by said tube having indicia adapted to be aligned with the upper end of the liquid in said capillary.

2,770,886
RIDGE BOARD HOLDER
Bruce W. Johnson, Crystal Lake, Ill.
Application October 23, 1953, Serial No. 388,022
3 Claims. (Cl. 33—180)



1. A ridge board holder comprising a tubular support, means for securing said support in an upstanding vertical position on a building frame element, a tubular rod slidably received in said support, a set screw threaded through a top portion of said support and being engageable with said rod for clamping said rod in an adjusted elevated position projecting from the top end of said support, an annular collar threadedly engaged on the top end of said rod, a horizontal annular flange on said collar, and a pair of spaced upstanding parallel arms adjustably secured on said flange and being adapted to receive a ridge board therebetween, said tubular rod being provided with an inch scale extending along its length and the tubular support being provided with a foot scale along its length, for setting said collar to a desired height above said building frame element.

2,770,887
DIRECTIONAL INCLINATION RECORDING APPARATUS
Arthur R. Barnett and Oswald Suter, Los Angeles, and Alfred J. Abz, Van Nuys, Calif., assignors to Technical Oil Tool Corporation, Ltd., Los Angeles, Calif., a corporation of California
Application January 9, 1951, Serial No. 205,091
15 Claims. (Cl. 33—205.5)



3. An instrument for surveying well bores which includes: an elongated housing; pendulum means mechanically suspended in said housing; compass means rotatably carried by said pendulum means; marking means mounted in said pendulum means for rotation with said compass means and responsive to movement thereof; a chart holder mounted for reciprocating movement within said housing and normally spaced from said marking means; operating means for reciprocating said chart holder through cycles of engagement and withdrawal from said marking means to record indicia indicating the relative inclination between said housing and said pendulum means and the orientation in azimuth of said compass means; and timing means operatively associated with said operating means and controlling the time of operation thereof.

2,770,888
LINE LEVELS
Harrison M. Von Duyke, Wilmington, Del., assignor to Modern Products Manufacturing Corporation, Wilmington, Del., a corporation of Delaware
Application May 4, 1954, Serial No. 427,587
2 Claims. (Cl. 33—207)

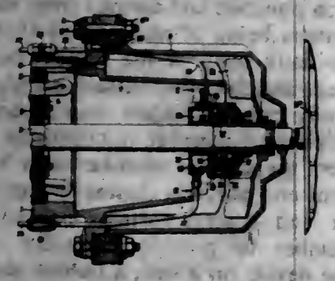
1. A line level comprising a housing consisting of two members each punched and formed from sheet metal, one of said members being of an inverted U-shaped channel formation initially open at the bottom before the parts are assembled, and the other of said members comprising a longitudinally extending plate secured between the side walls of the channel member to constitute a bottom closure member, the closure member also having integral upwardly bent end portions closing the ends of the channel member and having portions projecting above the channel member to provide hook-like extensions for mounting the device on a line, a bubble glass unit fixedly secured within the channel member, the channel member also having a central opening at the top for viewing the bubble glass therethrough, and the ends of the closure member having inwardly projecting lip portions complemental to the ends of the channel member for positioning the hook-like extension with respect to the bubble glass unit and for locating the bottom closure member in the channel member.

2,770,889
ADJUSTABLE CONTROL RING
Dante M. Allegretti and Louis P. Brunetto, New Britain, Conn.
Application January 24, 1955, Serial No. 483,627
2 Claims. (Cl. 33—214)

2. In a builder's tool comprising a combined square and level, an adjustable mounting for a bubble tube including a ring member having uniformly spaced teeth on the periphery thereof rotatably mounted on said tool, said tool being provided with a conically bottomed recess adjacent said peripheral teeth to guide the end of a screw driver for engagement with said peripheral teeth to rotate

said ring member, and means to adjustably frictionally hold said ring member in a plurality of said rotated positions.

---



2,770,890
MAGNETIC ELEMENT FOR APPARATUS DESIGNED TO DETERMINE THE DIRECTION OF A MAGNETIC FIELD
François Baptistin Bellon, Paris, and Jacques Louis Marie Henry Lenoir, Viroflay, France
Application November 24, 1953, Serial No. 394,132
7 Claims. (Cl. 33—222)

1. A magnetic field sensing or measuring element having the form of a body of revolution and presenting throughout its entire volume a magnetization of the same intensity and of the same direction, said direction being perpendicular to the axis of revolution of said magnetic element.

---

2,770,891
COOLED BEARINGS FOR OVEN DRYING MACHINES
Lorenz A. Wendel, Somerville, N. J., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application June 28, 1952, Serial No. 296,117
1 Claim. (Cl. 34—215)

In a fan for circulating air within an oven of a drying machine having a casing provided with an aperture, a member for surrounding the aperture and for extending into the oven, an anti-friction bearing carried by said member and being spaced from and axially alined with said aperture, a driven shaft extending through said aperture and journaled in said bearing, a fan fixed to the free end of said shaft within said oven, means for confining lubricant about said bearing comprising bearing covers surrounding said shaft upon opposite sides of said bearing and being secured to opposite faces of said member about said bearing, one of said bearing covers being provided with a coolant chamber having two pairs of diametrically opposed apertures formed therein, and conduits for conducting coolant to and from said jacket through said apertures, one aperture of each of said pairs being arranged in each of two spaced planes normal to the axis of said bearing cover, whereby the coolant may enter said jacket from a low point and exit therefrom at a vertically higher point when said shaft is arranged vertically and when arranged horizontally.

---

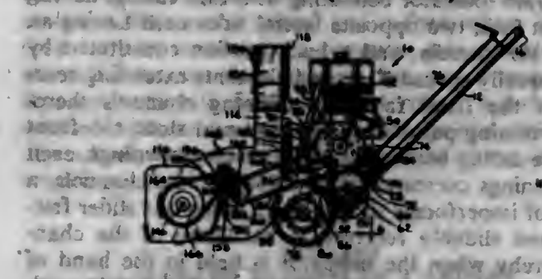
2,770,892
HEEL FOR SHOES
Fred Fay, Kansas City, Mo.
Application August 22, 1951, Serial No. 243,049
1 Claim. (Cl. 36—35)

A heel for shoes and the like comprising a relatively thin, one-piece, highly resilient, sponge rubber body having substantially flat, parallel top and bottom walls, and a side wall disposed perpendicularly to said top and bottom walls, said side wall including a convexly arcuate, rear face portion and a concavely arcuate, forward face portion, there being a continuous, peripheral groove in the body between the side wall and the bottom wall, said groove being L-shaped in cross section, said body having a vertical face extending upwardly from the bottom wall approximately half the thickness of said body, and a horizontal face extending inwardly from the side wall a distance approximately equal to said thickness of the body, said faces forming the top and side of the groove;

a one-piece, continuous, relatively non-resilient, wear-resistant, synthetic rubber band initially separate from the body, said band being of rectangular cross section and of configuration complementary to the configuration of the groove, the band being positioned on the body in filling relationship to said groove with the outermost and lowermost exposed surfaces of the band flush with the side wall and bottom wall respectively, the inner surfaces of the band being in engagement with the body; and adhesive bonding means permanently securing said surfaces of the band to said faces of the body throughout the entire zone of their interengagement.

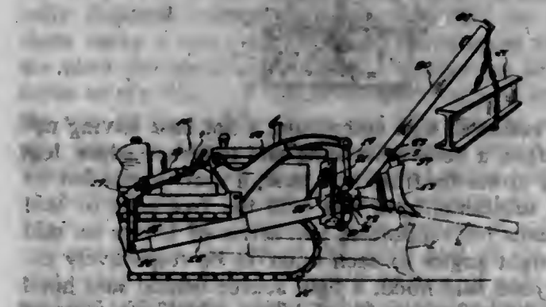
---

2,770,893
ROTARY SNOW PLOW
Joseph H. Jacobs, Minneapolis, Minn., assignor to Jacobs Wind Electric Company, Minneapolis, Minn., a corporation of Montana
Application June 11, 1951, Serial No. 230,933
1 Claim. (Cl. 37—43)



A rotary type snow plow particularly designed for hand guided operation, said plow comprising a support structure, a rotor housing having a generally segmental cylindrical lower portion terminating on one side in a free edge portion and having an upwardly inclined discharge portion disposed substantially tangentially to the other side of the lower housing portion, a bladed rotor journaled on a horizontal axis for rotation within said housing with the blades thereof traveling in a path disposed in closely spaced relation to the cylindrical portion of the housing and rotating in a direction to travel downwardly from said free housing edge and upwardly with respect to said tangentially disposed discharge portion, said free housing edge portion being disposed at least as low as a horizontal plane through the axis of said rotor so that all of the snow discharged by said rotor will pass freely out of said housing laterally thereof, a pair of lower forwardly extending segmental scoop elements having the rear portions thereof connected in fixed relation to the lower cylindrical housing portion and having their lateral extremities spaced apart only a distance equal to the diameter of the lower cylindrical housing portion, said lateral extremities extending downwardly into the same horizontal plane as the bottom of said housing to form a scraping edge adjacent the ground surface extending the full width of the housing, the inner edges of said scoop element converging rearwardly so that the lowered curved portions thereof hold down the housing to maintain engagement with the ground surface.

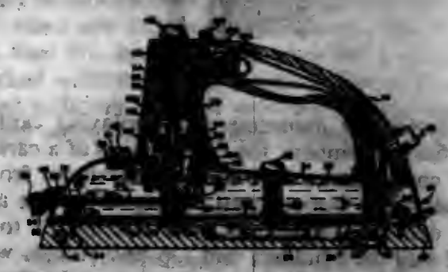
---



2,770,894
SNOW REMOVER OF THE ROTARY TYPE
Robert O. Gettelman, Pewaukee, Wis., assignor to Wisconsin Marine Company, Pewaukee, Wis., a corporation of Wisconsin
Application July 3, 1952, Serial No. 297,020
9 Claims. (Cl. 37—43)

1. A snow remover adapted for forward movement along a normal line of travel, a high speed rotor for ejecting snow having an axis of rotation transverse of said line of travel, a housing for said rotor having a discharge opening, a lower speed feeder reel having a substantially horizontal axis of rotation transverse of said line of travel, said feeder reel having its axis positioned forwardly of the peripheral circumferential path of travel of said rotor and close enough thereto so that in operation said feeder reel overlaps said rotor to deliver snow directly to the side of said rotor, and a housing for said feeder reel having a snow receiving opening, there being an opening between said housings.

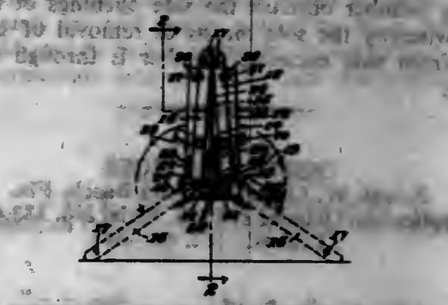
---



2,770,895
COMBINED CRANE AND BULLDOZER
Arnold S. Rymkovitch, Roseville, N. Y.
Application December 9, 1954, Serial No. 474,192
3 Claims. (Cl. 37—117.5)

1. A bulldozer comprising a tractor and an earth moving blade attached to the forward extremity of a pair of longitudinally extending push arms, the rearward extremity of each said push arms being pivoted to said tractor, the portion intermediate the forward and rearward extremities of said push arms being connected to a power actuating mechanism, a boom, a bracket comprising an arcuate portion secured to the front end of said tractor having a pair of fixed longitudinally extending ears, one end of said boom being pivotally connected between said ears for fixed pivotal movement relative to said tractor, a support affixed to an upper surface of said blade comprising a guide bracket having a pair of spaced legs and a roller rotatably supported therebetween, said roller being adapted to support said boom for longitudinal rolling engagement thereon intermediate the longitudinal extremities of said boom, said arcuate bracket further comprising reinforcing struts secured to said ears and extending below said arcuate portion into securing engagement with said tractor at a point beneath said arcuate portion.

---



2,770,896
SPRAY FLATIRON
Stanton W. Holmberg, Minneapolis, Minn., assignor to General Mills, Inc., a corporation of Delaware
Application July 19, 1954, Serial No. 444,154
8 Claims. (Cl. 38—78)

1. A combination spray and dry iron comprising a sole plate, an electrical heating element associated therewith for heating the sole plate, electrical leads connected to common supply leads for supplying electricity to said heating element, a reservoir connected to the iron to supply fluid for a spray, a spray apparatus having an electrical power driving means, electrical leads for the driving means connected to said common supply leads, a pump connected to the driving means and adapted to pump water from the reservoir, and a spray nozzle mounted on the iron and connected to the pump to spray water on the material being ironed.

---

2,770,897
FOLDING IRONING BOARD
Anthony J. Oldefield, Kalamazoo, Pa.
Application November 24, 1954, Serial No. 470,849
3 Claims. (Cl. 38—124)

1. In combination, a U-shaped support member including a horizontally disposed base and a pair of spaced parallel side walls extending upwardly from said base, said base extending between the lower ends of said side walls and serving as a brace member there being registering cutouts in said side walls, a pair of legs pivotally connected to the lower portions of each of said side walls, said legs being arranged contiguous to the outer surface of said side walls, cross pieces interconnecting opposed legs together, a latch mechanism for each pair of legs comprising a bracket secured to the outer surface of each of said walls and including an intermediate offset portion defining a channel, a shank slidably mounted in said channel, a latch secured to the lower end of said shank and provided with a pair of recesses defining a lug therebetween, a keeper secured to each of said legs and including an offset section terminating in an angularly arranged finger for engagement with the recesses in said latch, an apertured ear extending inwardly from said shank through the cutout in each of said side walls, and a chain connected to the pair of ears.

**2,770,898**
**CARD HOLDER**
Harry Henrik Lutz, Bronx, and William Groenberger, New York, N. Y., assignors to The Hopp Press Incorporated, New York, N. Y., a corporation of New York
Application February 9, 1952, Serial No. 270,814
1 Claim. (Cl. 40—10)

In a device for mounting and displaying cards having interfitting members, the combination of a card holder member comprising a rear wall, an apertured front wall, a top wall and a bottom wall joining said front and rear walls to define a passageway open at the ends to the interior of said card holder, said top and bottom walls being substantially parallel to each other and substantially coterminous with said front and rear walls; an encasing member for receiving said card holder comprising a rear wall, an apertured front wall, providing an opening substantially complementary to the opening of said card holder, a bottom wall joining said front and rear walls substantially coterminous therewith and a top opening formed in said encasing member by said rear, front, end and bottom walls to receive said card holder entirely within said encasing member, a protuberance and recess interengagement between said card holder and said encasing member at the rear wall thereof and an access passage through the bottom wall of said encasing member permitting contact from the exterior with the bottom wall of said card holder whereby in the interfitting position of said card holder and encasing member the height and width of the holder place the upper wall of the holder within the encasing member and obstructing the top opening of said encasing member while the end walls of said encasing member obstruct the side openings of the card holder whereby the sole means of removal of said card holder from said encasing member is through said top opening.

**2,770,899**
**DISPLAY DEVICES**
Joseph W. Litman, Miami Beach, Fla.
Application October 1, 1953, Serial No. 383,495
5 Claims. (Cl. 40—36)

1. A changeable display device comprising a housing having a front window, cam members in said housing at opposite sides of said window, similar cam grooves in opposed faces of said cam members, said cam grooves including arcuate groove portions connected by chordal groove portions aligned with said window, reversible display elements having central side projections seated in said grooves, means for selectively engaging projections of a foremost display element and move the same around said grooves, a guide in said housing engageable with a display element to constrain rotation thereof in its movement to effect approximately 180° rotation of said foremost display element whereby each display element is reversed in its movement through said arcuate portions.

**2,770,900**
**PROGRAM INDICATOR**
Robert E. Smith, Baltimore, Md.
Application October 31, 1951, Serial No. 254,070
1 Claim. (Cl. 40—65)

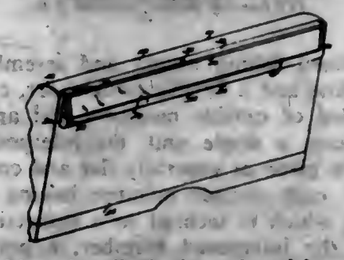
A program indicator consisting of a thin casing, having a flat front face, two opposite lateral sides each having an extended slot therein, and a back portion constituted by aligned, equally spaced T-shaped elements extending rearwardly of the front face and defining channels therebetween running parallel to the aforesaid slots, the front face of the casing having a row of viewing openings, each of the openings corresponding to each of the channels, a plurality of imperforate sliders, there being one slider frictionally and slidably received in each one of the channels, whereby when the indicator is held in the hand of the user with the channels in a substantially upright position, the sliders will remain in place until forcibly moved by the user, said sliders bearing indices visible through the openings, a handle on each of the sliders protruding outwardly of the casing, a bar extending transversely of the back of the casing, said bar terminating at both ends into a hook fitted in and guided by the aforesaid slots, said bar cooperating with the handles for resetting them to a starting position after use, said hooks being operable from either end of the indicator for actuating the bar.

**2,770,901**
**ANIMATED ADVERTISING SIGNS**
Richard N. Morton, Yakima, Wash.
Application October 9, 1953, Serial No. 385,199
4 Claims. (Cl. 40—77)

1. An animated sign comprising a flat base having upturned edges, a hood embracing said upturned edges, legs extending upwardly from said base, a shaft journalled on said legs substantially in line with the free edge of said hand, means for supporting two series of letters on said shaft at right angles to each other to be respectively exposed beyond said hood, a light source behind said hood for illuminating the series of letters which are exposed above the hood, means including a crank arm and a star wheel mounted on the base for oscillating said shaft to successively expose said two series of letters above the hood, and a counterweight on the shaft to maintain said crank arm against the star wheel.

**2,770,902**
**SEMI-AUTOMATIC PERPETUAL CALENDAR**
Karl Otto Schmidt, Idar-Oberstein, Germany
Application January 24, 1955, Serial No. 483,515
1 Claim. (Cl. 40—111)

Inside a semi-automatic desk calendar in desk form, two supports or legs resting on springs movable parallel to their long-axis and provided with two pins each, one of said pins mounted slightly aside from the long axis of said supports, two pinions provided with 7 and 10 teeth

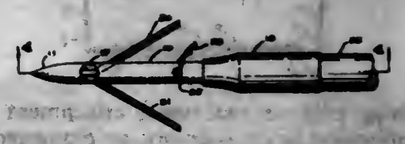


respectively adapted to be rotated by said pins one tooth by the up and down movement of said supports and then arrested, two rollers rigidly connected each to one of said pinions and marked respectively with the days of the week and the unit figures; a third roller marked with twice the succession of numbers 0 or blank, 1, 2, 3, rotated by a gear

consisting of 8 pins on the inside of said third roller, a coupling disc, a star wheel and a feed wheel both with four cogs mounted with a common axis eccentrically to the roller axis on said coupling disc, and a projection on the inside of said first-numbered roller; a fourth roller marked with the names of the months and rotatable independently from said three rollers, and spring devices for arresting said third and fourth rollers.

**2,770,903**
**TAXI SIGN DISPLAY CABINET**
Don Lawrence Schmidt, Coeur d'Alene, Idaho
Application December 22, 1955, Serial No. 554,858
4 Claims. (Cl. 40—125)

4. In a cabinet for displaying advertising matter in taxi cabs or the like, a housing including a curved bottom wall, a pair of vertically disposed spaced parallel side walls each provided with a flange, a portion of said housing being cutaway to define a window, a casing secured within said housing and including a horizontally disposed lower lip, a plate portion extending upwardly from said lip, a vertically disposed transparent plate supported on said lip, there being a space between said transparent plate and the plate portion of said casing for receiving advertising cards or the like, and means for securing said cabinet to the rear portion of the front seat of a vehicle such as a taxi cab, said means comprising brackets secured to said bottom wall and adapted to be secured to the rear portion of the back seat of the vehicle, and a horizontally disposed top wall extending from the plate portion of said casing and secured to the top of the front seat of the vehicle, and a cap detachably mounted on top of said cabinet, said cap comprising a top portion extending longitudinally across the top of said cabinet and terminating in a rear curved portion frictionally engaging the flanges on said side walls, said cap further including a downwardly extending portion terminating in a transverse section for engagement beneath the top wall section.



**2,770,904**
**GRENADE LAUNCHING DEVICE FOR A FIREARM HAVING A MUZZLE BRAKE**
Willi Weiss, Vernier-pres-Geneve, Switzerland, assignor to Brevets Aero-Mecaniques, S. A., Geneva, Switzerland, a society of Switzerland
Application October 22, 1951, Serial No. 252,462
Claims priority, application Luxembourg October 24, 1950
1 Claim. (Cl. 42—1)

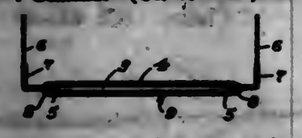
In combination, an automatic firearm having a barrel, a muzzle brake mounted on said barrel at the extremity thereof, said muzzle brake comprising a plurality of discharge ports, a tubular member associated with a grenade to be launched at least at the time of positioning and launching the grenade on the firearm, said tubular member having an internal diameter slightly greater than the external diameter of the muzzle brake, said tubular mem-

ber extending over all of said discharge ports to provide a gas-tight fit between said muzzle brake and said tubular member when said tubular member is slid into launching position over the muzzle brake whereby a grenade can be launched without loss of pressure due to the muzzle brake and sufficient recoil is provided for the firearm to permit any automatic operations thereof to occur.

**2,770,905**
**FISHING ARROWHEAD**
Arvo H. Ehrainson, Syracuse, N. Y.
Application April 8, 1955, Serial No. 500,134
2 Claims. (Cl. 43—6)

1. An arrowhead comprising a cylindrical solid body having a conically shaped point at one end thereof and a socket at the other end adapted to receive an end portion of a shaft, said body being provided with a pair of apertures arranged in spaced longitudinal relation and extending through said body adjacent said point, a single strand of formable material extending through said apertures and bent to substantially a V-shape with its apex on one side of said body and with its legs on the other side of said body extending longitudinally thereof and in diverging relation and forming a pair of barbs, the diverging ends of said barbs extending to a point adjacent said socket, and a retrieving line attached to said body intermediate said apertures and said socket.

**2,770,906**
**FISHING DEVICE**
Carl E. Hood, Darrouzett, Tex.
Application October 17, 1955, Serial No. 540,984
4 Claims. (Cl. 43—16)



1. In a fishing device, a support member including means for positioning it in a desired fishing location, a bearing frame member carried by and offstanding from said support member, a fishing rod receiving socket member pivoted on said frame member for oscillation with respect thereto and to said support member from a depressed position to an elevated position and vice versa, resilient means interposed between said socket member and frame member and serving normally to bias said socket member to its elevated position, a latch member carried by said socket member, a latch bar pivotally mounted in said frame member for oscillation therein

and serving for engagement by said latch member to releasably retain said socket member in its depressed position, a fishing line engaging trigger member carried by and adapted to impart oscillation to said latch bar in response to movement imparted to said trigger member by a pull on said fishing line to cause release of said latch member from said latch bar, and means serving normally to bias said trigger member and latch bar to engaged-latch position, including spring means having end connections with said frame member and a trigger member and means for varying the biasing effect of said spring means including a rock lever pivoted to said frame member and to which said spring means are connected and means for varying the angular position of said rock lever upon its pivot to thereby vary the biasing effect of said spring means.

**2,770,907**
**FISHING POLE SIGNAL ATTACHMENT**
Lawrence J. Shaver, Davis, Ill.
Application June 30, 1952, Serial No. 296,484
4 Claims. (Cl. 43—17)

1. A fishing pole or rod signal attachment comprising, in combination in an assembly, an elongated rod-like element that is luminous in the dark, a tubular transparent protective covering thereon that extends beyond both ends thereof, and a pair of easily bendable, non-springy wires anchored by their one ends in the opposite ends of the tubular covering next to the end of the luminous rod and extending therefrom and being of appreciable length to wind several turns around the small outer end portion of said fishing pole or rod to fasten the attachment by its ends to said pole or rod in closely spaced parallel relationship thereto.

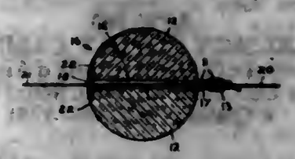
---

**2,770,908**
**COMBINED FISHING SINKER AND LINE SPREADER**
Charles Hessert, Jr., Camden, N. J.
Application December 19, 1952, Serial No. 326,819
4 Claims. (Cl. 43—42.74)

1. A combined fishing sinker and line spreader comprising a body having laterally spaced sockets therein, the axes of the sockets being in diverging relationship and lying in a plane common with the plane containing the body, hollow tubular members connected within and removable from each socket, and the wall of each tubular member having an aperture therein along the outer side thereof and through which a leader can be passed.

---

**2,770,909**
**FISHERMAN'S ANTI-FOULING SINKER**
Karl Hagner, Tonawanda, N. Y.
Application January 3, 1956, Serial No. 556,888
3 Claims. (Cl. 43—43.14)



1. A fisherman's sinker comprising a weighted body, a threaded stud projecting from the body, said stud being formed with axial slots, resilient wires disposed in the slots and diverging outwardly from and around the body, at least one of said wires being formed with a bail extending

beyond the end of the stud, and a nut threaded on the stud and around said bail to retain the wires in position, the end of the bail thereby providing an accessible eye for the attachment of a fishing line.

---

**2,770,910**
**COMBINED FISHING WEIGHTS AND ASSEMBLY BODIES**
Walter Gehrig, Flint, Mich.
Application November 30, 1953, Serial No. 395,105
9 Claims. (Cl. 43—44.9)

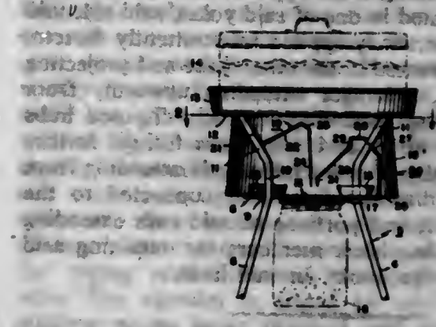
1. A combined fishing weight and assembly member for a fishing line and a flexible hookleader, comprising a body assembled of outside members and an interposed member to form a single unit, the interposed member consisting of a piece of generally flat and comparatively thin material, each outside member having a generally flat joint-face which is secured to a respective side and joint-face of the interposed member, a portion of the interposed member protruding from between the outside members and constituting the normal leading end of the assembled body, said interposed member having a comparatively long narrow leader passageway-slot formed therein with the slot-sides opening through both joint-faces of the interposed member and the outside members covering and closing the slot-sides, one end of the passageway-slot opening from between the outside members and forming an exposed line aperture beyond the outside members through said protruding portion of the interposed member to secure the end of a fishing line to the remaining leading end portion of the interposed member, the other end of the passageway-slot opening from between the trailing portions of the outside members and being flared to blend into the adjacent matched outer surface of the body-members, the body and surface forming said leader passageway being adapted to receive and circum-restrict the connective end-portion of a hookleader, and a leader retaining means being associated with said protruding portion of the interposed member to secure the connective end of the hookleader in the passageway thereto with the remainder of the hookleader protruding from the flared end of the passageway.

---

**2,770,911**
**ANT AND INSECT TRAPS**
Curtis Joseph Hetzel, Belle Chasse, La.
Application September 8, 1954, Serial No. 454,780
4 Claims. (Cl. 43—121)

1. A trap of the character described comprising an upright stand composed of a plurality of legs having portions disposed in diverging relation, a plate connecting said legs in spaced relation having a central opening, a tray adapted to support a bait receptacle mounted on the upper ends of said legs in vertical spaced relation

to said plate, a cup adapted to hold grease surrounding each of said legs above said plate, a receptacle adapted to hold poison depending from said plate beneath the central opening, and a runway extending between said



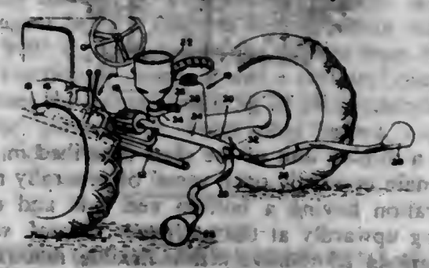


plate and one of said legs composed of a pair of narrow strips, each of said strips having a pointed end portion disposed in perpendicular relation to said plate above the central opening, the pointed end portions being spaced apart in parallel relation to provide a gap in the runway.

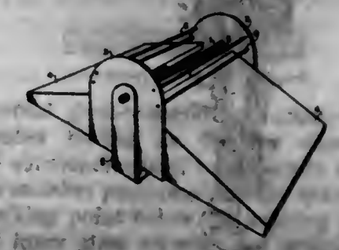
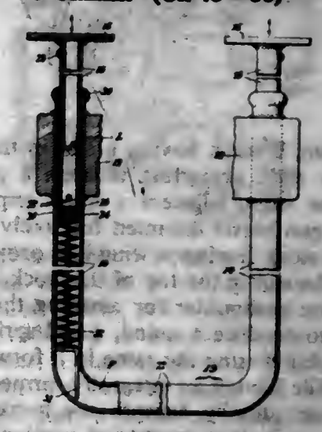
---



**2,770,912**
**DUSTING ATTACHMENT**
Charles M. Deem, Saugus, Calif.
Application July 15, 1955, Serial No. 522,289
4 Claims. (Cl. 43—147)

1. A dusting attachment comprising a hopper, a chamber connected to said hopper, an inlet conduit extending from one side of said chamber and adapted to connect said chamber to an engine exhaust pipe, an agitator in said hopper, a flexible cable connected, at one end, to said agitator and the other end extending through said chamber and adapted to be connected to a rotatable drive means, a multiperforated stationary plate between said hopper and said chamber, adjustment means comprising a slidable plate adjacent said stationary plate for adjusting the size of the perforations in said stationary plate, and an outlet conduit extending from the opposite side of said chamber.

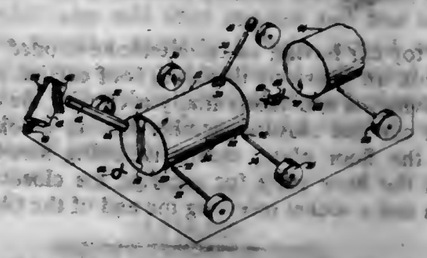
---



**2,770,913**
**BOOK RACK**
Walter Easter Hankin, New York, N. Y., assignor to Pressed and Welded Steel Products Company, Inc., Long Island City, N. Y., a corporation of New York
Application November 19, 1954, Serial No. 469,907
2 Claims. (Cl. 45—58)

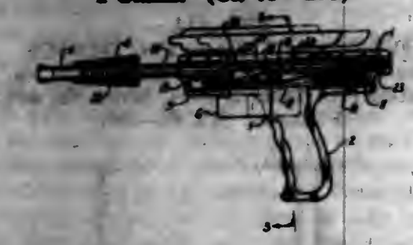
1. In a book rack a fixed cradle, a pivot rod supported by said cradle, a pendulous shelf mounted at its center on said rod and free to oscillate relative to said cradle, a plurality of book mounting means pivotally secured to said shelf and disposed transversely thereof above the rod whereby any one of the books and book mounting means may be readily positioned for use by tilting the shelf.

---



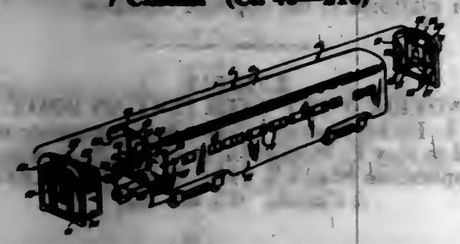
**2,770,914**
**HYDRAULIC LEVELING DEVICE**
Samuel Arthur Hooker, Marlinsville, Va.
Application November 2, 1954, Serial No. 466,341
3 Claims. (Cl. 45—86)

1. A hydraulic leveling device comprising a base, a pair of hollow legs extending upwardly from said base, said legs containing a hydraulic fluid, a pair of pistons extending telescopically into the tops of said legs, said pistons being hollow providing spaces therein, said spaces containing a compressible fluid, platforms fixed on top of the pistons, hydraulic means connecting said legs to one another below said pistons, and compression springs anchored adjacent the bottoms of said legs extending upwardly inside said legs bearing on the bottoms of said pistons, whereby a movement of one platform in a predetermined direction causes a corresponding movement of the other platform in the opposite direction.



---

**2,770,915**
**WHEELED TOY WITH TIN CAN BODY**
George L. Hicks, Prairie Village, Kans., assignor of one-half to Roy E. Weinzettel, Overland Park, Kans.
Application March 8, 1954, Serial No. 414,557
2 Claims. (Cl. 46—22)

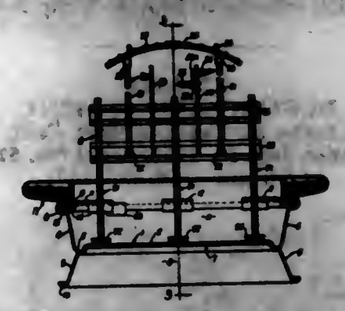


1. A wheeled figure toy comprising an elongated metal can having a cylindrical wall and a pair of closed ends, said wall being provided with a front pair of transversely spaced openings adjacent one end and a rear pair of transversely spaced openings adjacent the opposite end; axles extending through said openings; a pair of wheels on each axle respectively; an elongated tail member, said wall being provided at its top with an opening above said rear openings receiving said member; an elongated neck member, said one end of the can being provided with an opening receiving said neck member and the neck member extending for a substantial distance into the can; and a head member mounted on one end of the neck member exteriorly of the can, said neck member being provided with a hole adjacent the opposite end thereof, said tail member extending into said hole within said can to secure the assembly together.

2,770,916
**TRIGGER MECHANISM FOR TOY GUNS**
Joseph A. Slay, Pittsburgh, Pa.
Application November 28, 1952, Serial No. 322,912
1 Claim. (Cl. 46—175)

In a toy gun, a stock having a slot in the top thereof, and a trigger slide projecting through a portion of the bottom of the stock adjacent a hand grip provided on said stock, a gun barrel mounted for freely sliding movement in said stock having a wing-like projection extending through the slot in the top of the stock, said wing-like element having a shoulder for abutting the forward end of the stock to produce a sound, a coil spring at the rear of the barrel for biasing the same in a forward direction, said trigger slide having an integrally formed spring finger extending longitudinally beneath the barrel notched for engaging a complementary shaped portion of the barrel to retract the latter, and means in the path of rearward movement of said spring finger for displacing the same to release the barrel, said trigger slide being biased by a spring in a forward direction.

2,770,917
**END CONSTRUCTIONS FOR TOY CARS**
Moses Zion, Brooklyn, N. Y., assignor to The Lionel Corporation, New York, N. Y., a corporation of New York
Application October 26, 1953, Serial No. 388,326
7 Claims. (Cl. 46—216)



1. A toy car having an open ended extruded body provided with an interiorly disposed, roof carried rib, a floor plate having its end substantially even with the end of the body, a car end closure member having brackets which overlie the floor plate, means including screws passing through the floor plate for securing the closure plate in position and a socket receiving the end of the rib.

2,770,918
**ELECTRO-MECHANICAL BIRD DEVICE**
William Eugene Polk, New York, N. Y.
Application June 25, 1953, Serial No. 364,919
1 Claim. (Cl. 46—245)

In a power actuated toy, a body, a pair of wings pivotally connected to said body, links secured to the upper surface of said wings, hooks connected to said links, a spring coil having arms extended therefrom, a yoke on each of said arms, a solenoid, a band surrounding said solenoid, pins extending from opposite sides of the band and pivotally mounted in one of said yokes, said solenoid adapted to have electricity applied intermittently thereto, a core pivotally mounted in the other yoke and projecting into said solenoid, a hanger extending upwardly from said coil, cross fittings including vertically disposed hubs connected to said arms, and said cross fittings further including horizontally disposed hubs, rods extending from said horizontally disposed hubs and connected to the hooks on said links, end portions of said rods extending transversely to define hook members for retaining said rods connected to the hooks on said links.

2,770,919
**DISPLAY UNIT**
James J. Shumaker, Wickliffe, Ohio
Application June 2, 1953, Serial No. 359,187
9 Claims. (Cl. 47—39)

1. In a display unit of the class described in combination, a main upwardly open vessel of generally rectilinear configuration having a bottom and side and end walls extending upwardly at the periphery thereof, said vessel being formed of relatively thin flexible material, transverse stiffening members extending across the opening and engaged with certain of said walls, a stiffening and supporting unit mounted on said vessel including spaced columns inter-engaged with said vessel and stiffening members, said columns extending above said vessel and brace means mounted on said columns and extending therebetween.

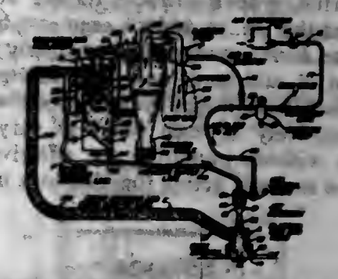
2,770,920
**TREE INOCULATOR**
Rosel W. Little, Meadill, Okla.
Application July 26, 1954, Serial No. 445,845
9 Claims. (Cl. 47—57.5)

1. A tree deadener comprising an elongated barrel, a valve body secured to the lower end of said barrel in communication therewith, said valve body having a valve seat at the upper end thereof and having a recess therein terminating at an upper wall of said valve body, a bark penetrating blade attached to said valve body, a valve rod extending through said barrel and said valve body, a valve disc member adjustably secured on said valve rod and adapted to seat on said valve seat, means extending normal to said barrel and outwardly thereof for raising said valve rod to raise said valve disc off from said valve seat, said means including a valve lifter foot secured to said valve rod, a shaft rotatably mounted in said barrel, and a cam attached to said shaft engaging said valve lifter foot to raise said valve rod upon rotation of said shaft, said valve rod having resilient means mounted concentrically thereon for urging said valve rod to a position wherein said valve disc member is seated on said valve seat, said resilient means being received said recess and yielding engaging said upper wall.

2,770,921
**SOIL CONDITIONING**
Lyle D. Goodhue, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application January 24, 1955, Serial No. 483,833
4 Claims. (Cl. 47—58)

1. A method of improving the condition of a soil which comprises applying to the soil an amount sufficient to condition the soil of a conditioning agent, said conditioning agent being a fraction boiling within the range of 185 to 900° C. consisting of the effluent from the condensation reaction of ammonia with a carbonyl compound selected from the group consisting of acetalydehyde, crotonaldehyde, paraldehyde, butyl ethyl ketone, n-caproaldehyde, and acetone.

2,770,922
**RADIATION COLORABLE CHROMIUM GLASS**
John V. Fitzgerald and George S. Buchanan, New Kensington, Pa., assignors to Pittsburgh Plate Glass Company
No Drawing. Application May 19, 1952, Serial No. 288,748
10 Claims. (Cl. 49—68)



5. The method of making fade-resistant colored glass comprising the steps of forming a radiation-colorable glass substantially free from substances that inhibit coloration of the glass by high energy radiation and containing between 0.02 and 2.0 percent chromium oxide, and exposing said glass to high energy radiation sufficient to produce significant coloration thereof.

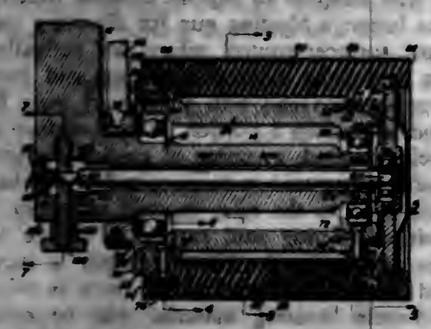
2,770,923
**INTERNAL GLASS-TO-METAL SEAL**
Robert H. Dalton and Raymond O. Voss, Corning, N. Y., assignors to Corning Glass Works, Corning, N. Y., a corporation of New York
Application September 4, 1951, Serial No. 244,988
5 Claims. (Cl. 49—92.5)

1. An internal glass-to-metal seal comprising an aluminum member having an opening extending therethrough and surrounding and hermetically united with a unitary glass member positioned in said opening, the glass having a working point below the melting point of aluminum, said inner glass member not protruding beyond the outer aluminum member at the area of sealing thereto, the aluminum member extending more than 7 mils in a direction substantially normal to the glass-aluminum interface.

2,770,924
**INSTANT STOP AND START BLASTING DEVICE**
William H. Mead, Oakland, Arthur A. Zambrano, San Mateo, and Alexander L. Jett, Menlo Park, Calif., assignors, by mesne assignments, to William H. Mead, Oakland, Calif.
Application April 1, 1954, Serial No. 420,254
18 Claims. (Cl. 51—8)

1. A surface treating device comprising a supply source for the treating material; a reclaimer separator having an inlet, an air outlet, and a connection to said supply source and adapted to deposit cleaned treating material in the latter; a blasting gun for directing said material at said surface; control means for activating and inactivating said gun; a hood enclosing said gun, said hood having an open end with a pervious maze bordering said end to enclose a portion of said surface around the area being treated; a source of suction connected to said air outlet from said reclaimer; a first conduit connecting said hood to the inlet on said reclaimer; a second conduit connecting said supply to source to said gun; means for producing simultaneously a suction in said second conduit and an impelling force in said blasting gun whereby treating material will be caused to flow in said second conduit to said gun; a third conduit connecting said second conduit and said supply source to the inlet end of said reclaimer and therethrough to said source of suction; whereby upon activation of said gun, the suction in said second conduit will move said treating material to said gun as needed, and the suction in said first conduit will remove from the surface area enclosed by the hood the spent treating material and loosened scale; and upon inactivation of said gun, the suction in said third conduit will be extended into said second conduit inducing a flow of air from said hood through said second conduit thereby moving out of said second conduit into said third conduit and into said reclaimer any treating material in said second conduit; and so long as the source of suction is connected to said reclaimer and said gun is inactivated, said treating material will be cycled through said third conduit, said reclaimer and said supply source.

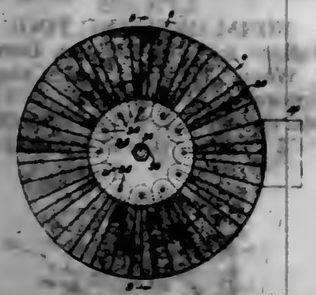
2,770,925
**FORM DRESSING TOOL**
Donald J. Wallace and Leo Catillo, Detroit, Mich., assignors to Wheel Trueing Tool Company, Detroit, Mich., a corporation of Delaware
Application October 19, 1954, Serial No. 463,087
2 Claims. (Cl. 51—184.1)



1. An adjustable form dressing tool comprising a base, a first abrading block segment fixedly secured thereto, a second abrading block segment positioned on said base laterally of and movable with respect to said first block

segment, cooperating means associated with said second block segment and said base for fastening said second block segment to said base in the desired laterally spaced relation to said first block segment, each of said block segments having a longitudinally extending raised land surface and a partial groove surface depressed from but laterally adjacent to the corresponding land surface, said land and partial groove surfaces having abrasive particles embedded therein, said block segments having spaced opposed plane surfaces extending obliquely to the longitudinal extent of said lands and from said partial groove surfaces to said base, whereby said block segments may be moved relatively to each other to vary the spacing therebetween without impairing the effectiveness of said partial groove surfaces acting together as a unitary abrading surface.

---



2,770,926
**EXPANDABLE SANDING DRUM**
Evar A. Heikkinen, Jamestown, N. Y.
Application December 19, 1955, Serial No. 553,907
5 Claims. (Cl. 51—190)

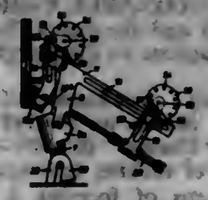
4. In an abrading machine, a power driven rotary hub journaled on a longitudinally bored support spindle, an expansible cylinder circumposed on said rotary hub, the hub and cylinder respectively including complementary tapered peripheral surface portions whereby relative reciprocable movement therebetween results in expansion and contraction of said cylinder, a pressure plate secured to one end of said cylinder, a force transmitting rod secured at one end to said plate, and cam means secured on said spindle in engagement with the other end of said rod for rotating the rod and reciprocating the same relative to the spindle.

---

2,770,927
**COATED ABRASIVE WHEEL ELEMENT**
Fritz E. Hendrickson, South Elgin, Ill., assignor to Norton Company, Troy, N. Y., a corporation of Massachusetts
Application October 17, 1955, Serial No. 540,853
4 Claims. (Cl. 51—193)

1. In a polishing wheel having a hub for removably mounting polishing elements, the improvements in a polishing element therefor comprising a sheet of fibrous material, pleats in said sheet forming a wave-like edge, a fold medially of said pleated sheet whereby the sheet is folded upon itself, and a substantially uniform abrasive coating bonded on at least one face of the sheet, said face on which the coating is applied being uncoated throughout a relatively narrow band extending about and along the medial fold.

---

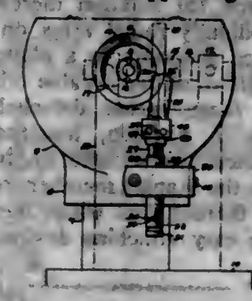


2,770,928
**ABRASIVE ARTICLE**
William K. Van Orsner and Joseph B. Aust, Niagara Falls, N. Y., assignors to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware
Application June 15, 1951, Serial No. 231,744
9 Claims. (Cl. 51—195)

3. An abrasive article comprising (*a*) a backing, (*b*) an anchoring layer comprising at least one course of textile fiber braided strand adhesively impregnated and bonded to said backing by means of a flexible rubber base adhesive and containing a plurality of vertically extending spaced textile fiber reinforcing pile members secured therein with the free ends projecting above the top surface of said anchoring layer, and (*c*) a layer of resin-bonded abrasive material imposed upon said anchoring layer and filling the space between said spaced pile members so as to form a substantially continuous grinding face.

---

2,770,929
**APPARATUS FOR THE GRINDING OF TWIST DRILLS**
Eugen Nädelin, Ebingen, Württemberg, Germany, assignor to Gottlieb Gühring, Ebingen, Württemberg, Germany
Application July 9, 1954, Serial No. 442,348
Claims priority, application Germany August 25, 1953
10 Claims. (Cl. 51—219)



1. Apparatus for the grinding of twist drills comprising a housing, a grinding disc rotatably supported on a horizontal shaft extending from said housing, a first slide mounted on said housing and adjustable in a vertical direction parallel to the grinding disc plane, two supporting bars extending horizontally and outwardly from said first slide in parallel relationship, a second slide slidably mounted on said supporting bars, an axle mounted on said second slide and extending parallel to the grinding wheel plane, a bifurcated bearing member mounted for tilting movement about said axle, a swivel pin mounted on said bearing member and inclined towards the grinding wheel, a drill support pivotally mounted on said swivel pin, and adjusting means mounted on said supporting bars and permitting adjustment of the point of intersection of the swivel axis and the drill axis in relation to the grinding disc plane for certain groups of drills and various drill diameters.

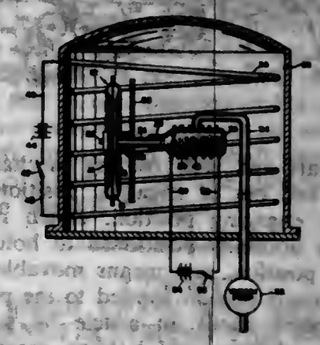
---

2,770,930
**TOOL REST FOR USE IN GRINDING MILLING CUTTERS**
Albert J. Norman, deceased, late of Santa Monica, Calif., by Ruth R. Norman, executrix, Venice, Calif.
Application January 15, 1954, Serial No. 404,214
6 Claims. (Cl. 51—225)

1. In an apparatus for grinding the tips of alternate teeth of a milling cutter wherein the forward faces of such alternate teeth have opposite inclinations with reference to radial planes of the cutter axis, and wherein the cutter is supported for rotation on an axis properly related to the grinding wheel so that the teeth of the cutter may be successively brought, by rotation of the cutter, into positions for proper grinding registry of the teeth tips with the face of a grinding wheel; an improved tool rest for supporting the successive teeth at proper intervals of rotation of the cutter so as to determine a desired angle of relief for the teeth tips as ground by the face of the grinding wheel comprising: a supporting head having means for adjustably mounting the same in a selected position relative to the mounted cutter; a blade having a free end provided with a pair of laterally opposed end faces for respective supporting engagement with the forward faces of alternate cutter teeth and having at its opposite end a pivot connecting it to said supporting head for tilting of

the blade in its own plane to alternate positions on respective sides of a vertical median line intersecting said pivot; stop members carried by said supporting head in positions spaced from opposite sides of the median vertical axis of said head extending through said pivot, and engageable by respective sides of said blade for determining respective limit positions of said blade on opposite sides of said median axis, said end faces being inclined at symmetrical acute angles to the central longitudinal axis of the blade and intersecting at said longitudinal axis, the angle of inclination of said end faces being somewhat greater than the angle of inclination of said forward faces of the cutter teeth, whereby in the tilted positions of the blade the angles of inclination of said end faces to the horizontal will correspond to the angles of inclination of said forward faces of the cutter teeth to provide full width support therefor.

---



2,770,931
**LIQUID COOLED ABRASIVE GRINDER**
Warren M. Mansfield and Albert W. Olitt, Jr., Glendale, Calif.
Application April 13, 1953, Serial No. 348,482
4 Claims. (Cl. 51—267)

1. In cooling means for abrasive cutters including a grinding wheel having a shaft, the improvement which comprises a cup member coaxial with said shaft at each side of the wheel, each of said cup members having an outer flange, a gasket between the outer margin of each of said flanges and the wheel, each of said members providing a chamber at the central portion of the wheel, said shaft having an abutment and having an outer end having threads, a hollow nut for said threads for clamping said cup members and said wheel together against said abutment and conduit means including a passage extending through said nut and connecting with said chambers for supplying a liquid coolant to said chambers, one of said cup members being an outer cup member adjacent said nut, the extent of said gasket for said outer cup member over the inner portion of the outer side of said wheel being greater than the extent of said other gasket over the central portion of the other side of said wheel to equalize liquid intake by said wheel.

---

2,770,932
**METHOD FOR FABRICATING PRESSURE SENSITIVE DEVICES**
William R. Polye, River Edge, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application May 25, 1953, Serial No. 357,280
9 Claims. (Cl. 53—6)

4. The method of producing and maintaining a high vacuum in an expansible and contractible pressure sensitive device, comprising the steps of permanently communicating the device with a container having a gas adsorbing medium therein, evacuating the device and container whereby all gases except residual gases are removed therefrom, heating the gas adsorbing medium during evacuation to drive adsorbed gases therefrom, and thereafter sealing the container whereby the gas adsorbing medium adsorbs the residual gases.

---

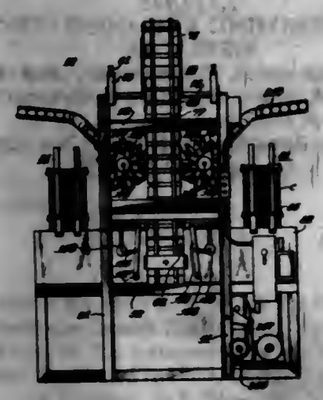
2,770,933
**METHOD OF FORMING BALLOONS CONTAINING MESSAGES**
Raymond L. Hakomaki, Minneapolis, and William F. Hack, St. Paul, Minn., assignors to General Mills, Inc., a corporation of Delaware
Application June 25, 1951, Serial No. 233,450
6 Claims. (Cl. 53—29)

1. The method of making a series of sealed object-containing balloon envelopes comprising the steps of placing a plurality of objects within a length of tubular stock, moving the entirety of said objects except one along within the tubular stock, and cross sealing the flattened opposed layers of the tubular material between said one object and the remainder of objects.

---

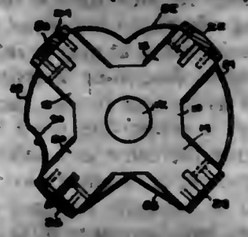
2,770,934
**WRAPPER FEED MECHANISM FOR WRAPPING MACHINES**
Arthur A. Kottmann, Davenport, Iowa, assignor, by mesne assignments, to American Machine & Foundry Company, New York, N. Y., a corporation of New Jersey
Application October 29, 1952, Serial No. 317,462
20 Claims. (Cl. 53—66)

1. In a wrapping machine, a feed mechanism for advancing articles to be wrapped, means for supporting



a web of wrapping material with an end thereof suspended in the path of an article advanced by said feed mechanism, a wrapping mechanism including means for clamping the web to said article and for moving said article to wind the web about the article and to exert a pull on said web, mechanism for feeding said web toward the wrapping mechanism, means for driving said web feeding mechanism comprising a continuously driven shaft and a driving connection including a clutch be-

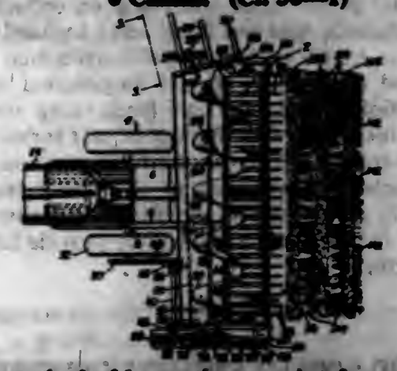
tween said shaft and web feeding mechanism that is movable into and out of engaging position and that is biased toward engaging position, clutch releasing and holding means normally positioned to hold said clutch in disengaged position, and means movable in response to a predetermined tension applied to the portion of the web being wound about an article by said wrapping mechanism for shifting said holding means to release said clutch and permit it to move to engaging position.



---

**2,770,935**
**CARTON LOADING MACHINE**
**Biagio J. Nigrelli, Stubbs, Ill., assignor to Ralph W. Johns, Biagio J. Nigrelli, and Robert R. Johns, Chicago, Ill., doing business as Johns, Nigrelli, Johns, a copartnership**
**Application September 21, 1955, Serial No. 535,548**
**27 Claims. (Cl. 53—168)**

1. In a machine for placing cans in open end cartons of the sleeve type, a vertically disposed conveyor adapted to be driven at substantially constant speed, members carried by said conveyor defining pockets adapted to receive erected cartons, a turret member rotatably mounted on a horizontal axis in tangential proximity to said conveyor pockets and formed with radially disposed pairs of notches each adapted to receive a can, supply means including an inclined chute adapted to roll cans on their chimes by gravity into successive pairs of notches of the turret member, resilient members carried by and disposed radially of the turret member adjacent each notch thereof and adapted to engage and retain the cans in said notches, means to rotate said turret member at the tangential speed of the conveyor and fixed cam means adapted to roll each can in succession out of its notches and into the carton carried by the tangentially adjacent pocket.



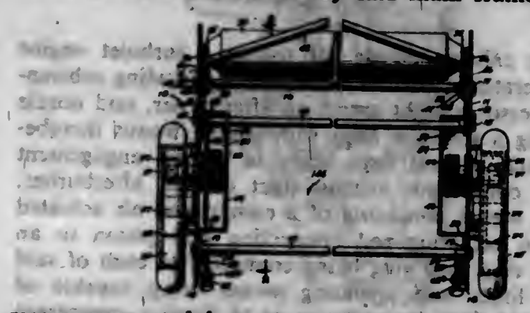
**2,770,936**
**ROTARY FORMING, SEALING, AND CUTTING APPARATUS FOR CONTAINERS**
**Peter H. Clark, Worcester, Mass.**
**Application February 9, 1951, Serial No. 210,142**
**1 Claim. (Cl. 53—180)**

A container making apparatus comprising a cylindrical crimping and shaping tool including an arbor, a cylindrical body thereon for rotation therewith, a series of elongated longitudinally radial arms on the body, each arm having a face generally in a plane parallel to the arbor axis, a longitudinal replaceable crimping device on each of selected faces, means detachably securing the crimping devices in position, longitudinal detachable shaped shaping members secured to the body between each pair of arms, the shaping members being shorter than the body axially thereof, and wings thereon at the ends thereof providing easy attaching devices to the body of the tool.

---

**2,770,937**
**METHOD OF HARVESTING AND CURING FORAGE CROPS**
**Edwin F. Huddle, Elmwood Park, Ill., assignor to International Harvester Company, a corporation of New Jersey**
**Application March 17, 1952, Serial No. 277,034**
**6 Claims. (Cl. 56—1)**

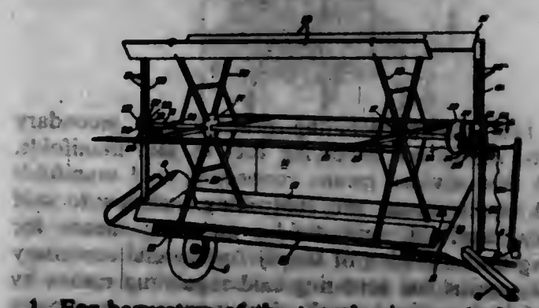
1. A method of harvesting growing forage plants composed of stems with leafy matter at the head ends which compriaes cutting down the plants at the stems in progressive parallel lines of cutting and to leave a stubble, then immediately crushing the plants of each line of cutting, then immediately laying the plants in a swath upon the field with each line of cutting laid upon the preceding in shingle-fashion and with the leafy heads of each line of cutting laid upon the stems of the preceding line of cutting, then immediately picking and elevating successive lines of cutting, while turning the same sidewise and conveying them laterally of the swath with the head ends of the plants end first in the direction of movement, and then depositing each line of cutting into a windrow by dropping each plant head end first into the stubble so as to bury the head end between the stubble and position the stem end up out of the stubble.



---

**2,770,938**
**POWER TOOL FOR LAWN MAINTENANCE**
**Edward T. Kiernan, Long Hill, Conn.**
**Application May 4, 1953, Serial No. 352,703**
**5 Claims. (Cl. 56—2)**

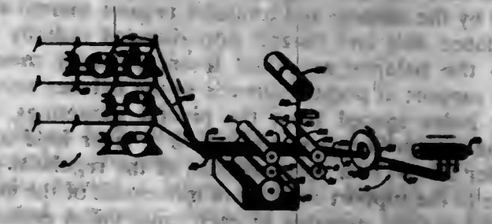
1. A power tool of the character described, comprising a main frame including a pair of side frame mem-



bers, a pair of ground engaging traction wheels, a stub shaft rotatably mounting one traction wheel on the outer side of one side frame member, a stub shaft rotatably mounting the other traction wheel on the outer side of the other side frame member, gearing carried by said one side frame member connected to said one traction wheel for rotation of said wheel and gearing through turning of one by the other and including a transverse horizontal shaft rotatable in said one side frame member and a spur gear carried by said shaft at the inner side of said one frame member, gearing carried by said other side frame member connected to said other traction wheel for rotation of said wheel and gearing through turning of one by the other and including a transverse horizontal shaft rotatable in said other side frame member and a spur gear carried by said shaft at the inner side of said other side frame member, said horizontal shafts being axially aligned and laterally spaced from each other to provide a free space between them, a motor driven shaft carried by said main frame, driving

means connected between said motor driven shaft and said gearing carried by said one side frame member to drive said gearing, a pair of tool supports, one mounted on one of said side frame members and the other mounted on the other side frame member at the respective sides of said free space, and a tool unit removably engageable in said free space and including a frame having transversely spaced sides, a pair of tool support engaging means carried by said respective sides of said unit removably engageable with said respective tool supports, a transverse horizontal shaft rotatably mounted in said sides of said tool unit frame, and a pair of spur gears, one mounted upon each end of said transverse horizontal shaft of said unit outwardly of said sides of said tool unit frame, said last mentioned spur gears being laterally spaced apart a substantially corresponding distance to the lateral spacing of said first mentioned spur gears and adapted to respectively mesh and unmesh with said respective first mentioned spur gears upon respective engagement and removal of said tool unit relative to said free space.

---



**2,770,939**
**POWER ACTUATED REEL OPERATING MEANS**
**Elmer W. Berg, Wheaton, and Edward J. Johnston, Chicago, Ill., assignors to International Harvester Company, a corporation of New Jersey**
**Application November 12, 1953, Serial No. 391,420**
**15 Claims. (Cl. 56—222)**

1. For harvesters of the type having a platform above which is carried for vertical adjustment a support on which is mounted a reel structure including a rotatable reel having an outwardly projecting shaft and a reel-driving element concentric with the reel and shaft for rotating the reel relative to the shaft and wherein vertical adjustment of the reel is effected by a rack connected to the platform and extending upwardly adjacent to the shaft and in axially spaced relation to the reel driving element, the improvement comprising: means including a pinion fixed to the shaft in meshing engagement with the rack for rotation with said shaft relative to the reel driving element; a continuous ruaning driving countershaft journaled on said support; means continuously drivingly interconnecting said reel driving element with said driving countershaft in counterrotating relationship; and a selectively connectable drive transmitting means on said element and said shaft for rotating the shaft therewith and said pinion in one direction on said rack for moving said reel in one direction and a selectively connectable drive transmitting means on said countershaft and said shaft for rotating said shaft and said pinion in the reverse direction to said one direction for moving the reel in an opposite direction.

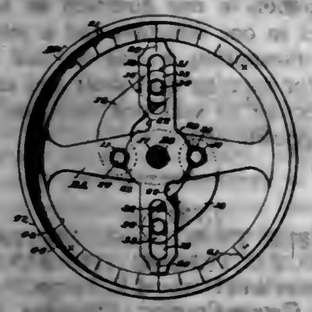
**2,770,940**
**GLASS FIBER TWINE AND METHOD OF MANUFACTURING THE SAME**
**Albert R. Morrison and Harland E. Fargo, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, Toledo, Ohio, a corporation of Delaware**
**Application July 12, 1952, Serial No. 298,506**
**5 Claims. (Cl. 57—156)**

1. A paper-glass fiber twine consisting in a core of adhesive bonded, laterally compacted, paper and an exterior sheath of spirally parallel continuous filament glass fiber strands adhered together and to said core by a flexible adhesive.

---

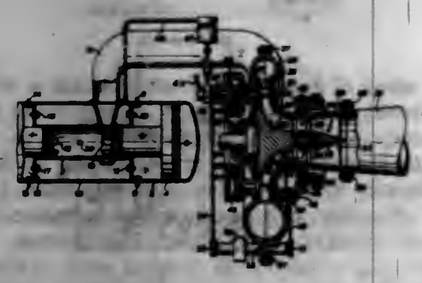
**2,770,941**
**AIR OPERATED CLOCK**
**Vincent A. Flagiello, New Haven, Conn.**
**Application May 10, 1955, Serial No. 507,362**
**7 Claims. (Cl. 58—42)**



1. A clock comprising a spring device for driving a clock mechanism, and means for automatically tensioning said spring device at intervals, said means including a fluid pressure actuating piston and cylinder, and control means for controlling the movement of the actuating piston, said control means including a fluid pressure supply line, said actuating piston having a transverse bore, a spring loaded control piston slidably positioned in said transverse bore, a piston rod on said control piston engaging the inner

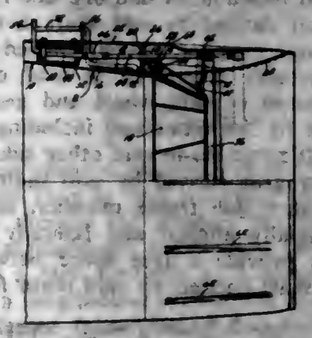
surface of the cylinder, said cylinder having recessed means for controlling the transverse movement of the piston rod and control piston during longitudinal movement of the actuating piston, and means actuated by transverse movement of the control piston for admitting air into the cylinder for extending said actuating piston.

---



2,770,942
**HOROLOGICAL BALANCE WITH ADJUSTABLE MOMENT OF INERTIA**
Maxime Favret, Elgin Ill., assignor to Elgin National Watch Company, Elgin, Ill., a corporation of Illinois
Application March 3, 1953, Serial No. 340,111
8 Claims. (Cl. 58—107)

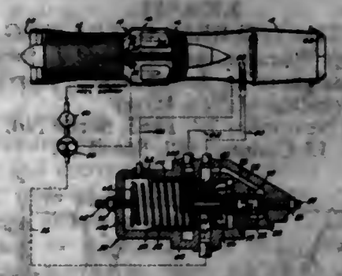
1. A balance for a horological instrument, comprising a support, a system of masses individually movable relatively toward and from the balance axis, a regulator piece carried by the support and rotatable relative thereto about the balance axis and having slots directed radially relative to the balance axis, and levers pivotally mounted on the support at points eccentric to the balance axis and having holes spaced from the pivotal mountings, each mass having projections engaged in a lever hole and a regulator slot so that upon rotation of the regulator piece relative to the support concurrent movement of the masses are produced by swinging of each mass under control of its associated lever and regulator slot.



---

2,770,943
**TURBINES OPERATED BY FREE-PISTON GAS GENERATORS**
Evelyn Stewart Lansdowne Beale, Wraysbury, England, assignor to Alan Muntz & Company Limited, Hounslow, England, a company of Great Britain
Application March 18, 1952, Serial No. 277,209
Claims priority, application Great Britain March 21, 1951
15 Claims. (Cl. 60—13)

1. A power unit comprising, in combination, a free-piston gas-generator, an inward flow, radial flow turbine, said turbine having variable nozzle blades in the inlet thereof, gas-delivery means connecting said gas-generator with said turbine inlet, and nozzle blade-actuating means responsive to the pressure of the gas supplied to said turbine to increase automatically the areas between said nozzle blades with reduction in the pressure of said gas at least over a range of relatively low gas pressures.



2,770,944
**VARIABLE AREA REACTION NOZZLE MOVABLE FROM CONVERGENT TO CONVERGENT-DIVERGENT FORM**
Donald J. Jordan, Glastonbury, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application April 26, 1952, Serial No. 284,511
19 Claims. (Cl. 60—35.6)

14. An exhaust nozzle for use in a turbojet engine which operates at various flight speeds including substantially supersonic flight speed, an afterburner, said nozzle comprising a series of flaps with sealing means therebetween, each of said flaps being in pivotal engagement with the convergent exhaust duct of said afterburner, actuating means consisting of a compressed air actuated piston, an actuating rod connecting said piston to an actuating ring, said ring being connected to each of said flaps by links, said actuating means being capable of moving said flaps inwardly so as to form a convergent exhaust nozzle for optimum thrust generation during non-afterburning operation of said engine when the velocity of the exhaust gases relative to said convergent nozzle is substantially subsonic and said actuating means also being capable of moving said flaps outwardly so as to form a convergent-divergent exhaust nozzle with said convergent exhaust duct and a divergent exhaust duct which is attached to said convergent nozzle and downstream thereof, said convergent-divergent exhaust nozzle affording optimum thrust generation during afterburner operation when the speed of the exhaust gases relative to said convergent-divergent nozzle is substantially supersonic.

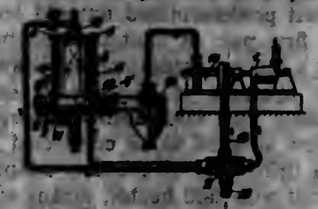
2,770,945
**JUMP-TYPE FLOW DIVIDER FOR GAS TURBINE POWER PLANT FUEL SYSTEM**
Hugh S. Crim, Glastonbury, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application August 17, 1953, Serial No. 374,490
12 Claims. (Cl. 60—39.09)

1. A fuel system including primary and secondary manifolds, means for supplying fuel to said manifolds, and fuel flow divider means connecting said manifolds and said supply means and controlling fuel flow to said secondary manifold, said divider including means for regulating the admission of supply fuel to said secondary manifold, means for actuating said regulating means by supply fuel pressure, supply fuel pressure responsive means for controlling the admission of supply fuel to actuate said regulating means to admit supply fuel to said secondary manifold, and means for terminating said supply fuel to said secondary manifold at a supply fuel pressure lower than the value initially actuating said regulating means.

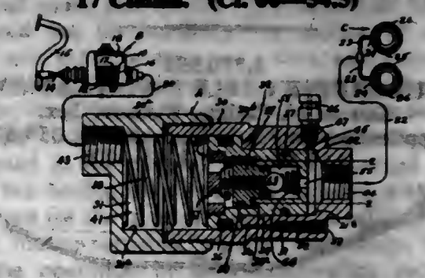
---



2,770,946
**BRAKE FOR TURBINE ROTOR**
Bennett S. Sevin, Jr., Glastonbury, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Original application March 21, 1950, Serial No. 150,858, now Patent No. 2,747,367, dated May 29, 1956. Divided and this application December 9, 1953, Serial No. 397,065
3 Claims. (Cl. 60—39.14)

1. In a gas turbine power plant, a multistage compressor having independently rotatable high and low pressure rotors, a multistage turbine having independently rotatable high and low pressure rotors, the low pressure compressor and turbine rotors being connected together to rotate as a unit, and the high pressure compressor and turbine rotors being connected together to rotate as a unit, said low pressure rotors and said high pressure rotors forming independently rotatable spools, the high pressure spool being located axially between the low pressure compressor rotor and the low pressure turbine rotor, brake means, a gear connection from one of said spools to said brake means for stopping the rotation of one of said spools, and a starting means for rotating the other spool in starting the power plant.

---



2,770,947
**GAS TURBINE PLANT FOR PULVERIZED FUEL WITH COMBUSTION CHAMBER SURROUNDED BY AIR COOLING DUCTS**
Max Ledinegg, Vienna, Austria, assignor of one-half to Simmering-Graz-Pauker Aktiengesellschaft für Maschinen-Kessel- und Waggonbau, Vienna, Austria, a company working under the laws of Austria
Application November 16, 1949, Serial No. 127,724
Claims priority, application Austria November 26, 1948
3 Claims. (Cl. 60—39.46)

1. In a gas turbine plant, in combination, an upright combustion chamber for burning pulverized fuel whereby combustion gases and liquid slag are produced, said combustion chamber including a heat insulating wall means, and having a top portion formed with a fuel inlet and a bottom portion formed with a slag outlet for discharging liquid slag; a plurality of substantially parallel upright pipes located outside of said combustion chamber on said heat insulating wall means and extending between said top and bottom portions of said combustion chamber, said plurality of upright pipes including a first set of pipes and a second set of pipes; reversing chamber means at said top portion of said combustion chamber and communicating with the top ends of said first and second sets of pipes, the bottom ends of said first set of pipes being adapted to receive air as a cooling medium; an annular mixing chamber surrounding said bottom portion of said combustion chamber and communicating therewith so as to receive combustion gases therefrom, said mixing chamber also communicating with the bottom ends of said second set of pipes whereby combustion gases from said combustion chamber and air from pipes are mixed in said mixing chamber, said mixing chamber being formed with an outlet for the mixture of air and combustion gases.

---

2,770,948
**ASSISTER UNIT FOR HYDRAULIC BRAKE SYSTEMS**
Gilbert E. Porter, Los Angeles, Calif.
Application November 6, 1951, Serial No. 255,051
17 Claims. (Cl. 60—54.5)

1. In an hydraulic assister for a fluid control system, the combination comprising: a housing with an internal cylinder having a larger diameter portion with a fluid inlet and a smaller diameter portion with a fluid outlet; a differential piston movable within the cylinder and dividing the cylinder into a larger diameter chamber and a smaller diameter chamber, the piston having two end faces of different effective areas exposed respectively to fluid pressures in the larger and smaller diameter chambers; a single fluid passage means extending between the two chambers; check valve means associated with the passage means for closing the passage to fluid flow from the smaller diameter into the larger diameter chamber but opening in response to excess pressure in the larger diameter chamber, said check valve means including a seat member and a valve member movable relative to each other to an open position; and valve operating means for opening said valve means in response to a decrease in fluid pressure in the larger diameter chamber below a predetermined value, said valve operating means including a pressure responsive member carried on the differential piston and exposed to fluid pressure in the larger diameter chamber to move relative to the piston in response to said fluid pressure, said pressure responsive member being operatively associated with one of said members of the check valve means to transmit motion thereto to move said one member of the valve means relative to the other.

---

2,770,949
**POWER-ASSISTED OPERATING MECHANISM FOR HYDRAULIC PRESSURE SYSTEMS**
Glenn T. Randol, Mountain Lake Park, Md.
Application August 20, 1952, Serial No. 305,460
11 Claims. (Cl. 60—54.6)

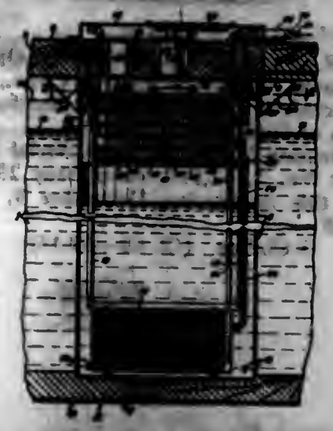
9. In hydraulic pressure-producing mechanism comprising an operator-operated member having a normal

released position, a hydraulic cylinder having a chamber for displacing liquid under pressure through a discharge port and a liquid reservoir therefor, power means having a movable member with a portion thereof operably projectable into said chamber, and a source of operating power for said power means: liquid passageway means normally open between the chamber and reservoir afore-

said; and control means including a pair of elements movable relatively to said movable member to effect closure of said passageway means to condition said chamber to displace liquid under pressure as aforesaid, and to subsequently cause operation of said power means to effect in part said liquid displacement, respectively, responsive to operating said operator member from released position.

---

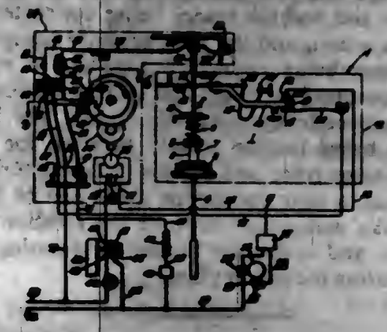
2,770,950
SUBMARINE CABLE INSTALLATION
Samuel V. Collins, Victoria, Tex.
Application June 5, 1953, Serial No. 359,871
11 Claims. (Cl. 61—72)



1. The method of laying a continuous length of conduit on the floor of a body of water, comprising fastening by releasable connections to the conduit in selected longitudinal spacing, a series of pontoons of size and number in relation to conduit weight to suspend the conduit below the water surface adjacent the floor of the body of water, joining the releasable connections each to a guide buoy by a length of line at least as long as the distance of pontoon submergence, tying the buoys for submergence with the conduit by releasable hold-down connections, joining all the last mentioned connections to a connection releasing jerk line extending along the length of the conduit, launching and maneuvering the conduit in the body of water into its desired resting place on the floor, then exerting tension on the jerk line to break in succession the guide buoy hold down connections and finally exerting tension on the connecting line of each surfaced guide buoy to release the first mentioned connections and unfasten the submerged pontoons for dropping the conduit.

---

2,770,951
APPARATUS FOR UNLOADING IN GASEOUS FORM FROM A LIQUEFIED GAS STORAGE BODY
Willard L. Morrison, Lake Forest, Ill., assignor to Union Stock Yards & Transit Company of Chicago, Chicago, Ill., a corporation of Illinois
Application December 31, 1952, Serial No. 328,862
8 Claims. (Cl. 62—1)

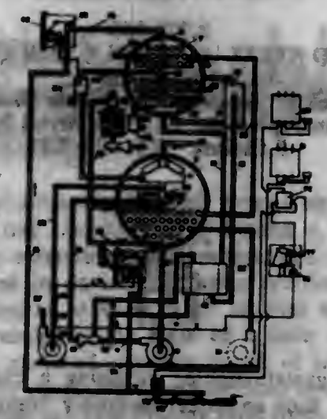


1. The combination with a container for a cargo of liquefied gas maintained at a predetermined pressure and subatmospheric temperature, of means for progressively converting such cargo to gaseous form and delivering it from said container at a pressure at least as great as said predetermined pressure, said means comprising: (*a*) an enclosure supported in said container with at least the lower portion thereof below the level of liquefied gas in such container, said enclosure divided into lower and upper compartments and provided with (i) a first passage for the entrance of liquefield gas into said lower compartment, (ii) a second restricted passage connecting said

compartments, and (iii) a third passage for the discharge of the vaporized gas from the upper compartment; (*b*) heat exchange coils in said upper and lower compartments respectively; and (*c*) means for circulating a heat exchange fluid, which is initially warmer than said liquefied gas, through said heat exchange coils.

---

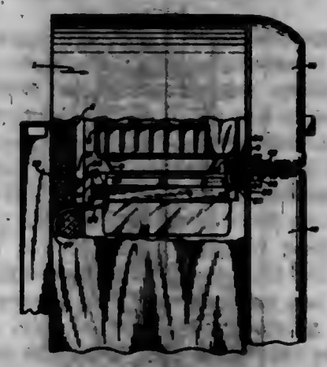
2,770,952
REFRIGERATOR CONTROL SYSTEM
Edwin B. Judd, Morrison, Ill., assignor to General Electric Company, a corporation of New York
Application June 30, 1953, Serial No. 365,158
13 Claims. (Cl. 62—4)



1. In a refrigerator having a door, a compressor motor adapted to be connected to an external source of power, and a heater arranged to defrost said refrigerator and adapted to be connected to said source of power; a temperature control device comprising temperature responsive means including means adapted to sense a temperature in said refrigerator, a first pair of contacts adapted to be connected in circuit with said motor, operating means actuated by said temperature responsive means arranged to close said first pair of contacts thereby energizing said motor at a first predetermined upward temperature and to open said first pair of contacts thereby deenergizing said motor at a second predetermined lower temperature, timing means operable in response to said door being open at the same time said motor is energized, a second pair of contacts adapted to be connected in circuit with said motor, a third pair of contacts adapted to be connected in circuit with said heater, means actuated by said timing means arranged to open said second pair of contacts thereby deenergizing said motor and to close said third pair of contacts thereby energizing said heater after a predetermined period of operation of said timing means, and tripping means actuated by said operating means arranged to again close said second pair of contacts thereby energizing said motor and to open said third pair of

contacts thereby deenergizing said heater at a third predetermined upper temperature above said first predetermined temperature.

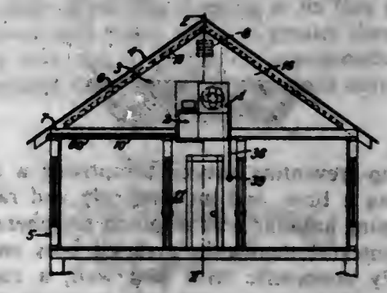
---



2,770,953
CONTROL ARRANGEMENTS FOR ABSORPTION REFRIGERATION SYSTEMS
Louis Howell Leonard, Jr., East Syracuse, N. Y., assignor to Carrier Corporation, Syracuse, N. Y., a corporation of Delaware
Application April 8, 1955, Serial No. 500,140
13 Claims. (Cl. 62—5)

1. In an absorption refrigeration system, the combination of an absorber, an evaporator, a generator and a condenser, said generator including tubes to which steam or other vapor is supplied in heat exchange relation with solution exteriorly of the tubes, and means for rendering at least a number of the tubes ineffective to extract latent heat from the steam responsive to a change in load imposed upon the system.

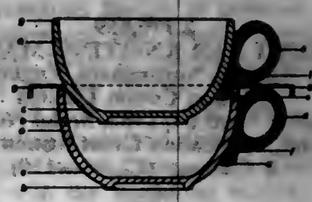
---



2,770,954
BAFFLE AND MOUNTING MEANS IN REFRIGERATOR
Robert Alexander Jansen, Cincinnati, Ohio, assignor to Avco Manufacturing Corporation, Cincinnati, Ohio, a corporation of Delaware
Application November 28, 1951, Serial No. 258,665
7 Claims. (Cl. 62—117.3)

7. In combination, a refrigerator cabinet including interior walls, an evaporator within said cabinet surrounded by said interior walls, a defroster-heater contacting said evaporator and having portions disposed beneath said evaporator substantially parallel thereto, an adjustable bracket secured to one of said interior walls for adjustment vertically relative to said evaporator and said defroster-heater, a relatively fixed bracket secured to one of said interior walls remote from said adjustable bracket, and a baffle in supported engagement with said brackets, adjustment of said adjustable bracket varying the vertical position of said baffle for bringing it into close proximity with said parallel portions of said defroster-heater.

---



2,770,955
AIR-CONDITIONING DEVICE FOR AN ATTIC
Allan W. Lundstrom, Columbus, Ohio
Application May 17, 1954, Serial No. 430,364
13 Claims. (Cl. 62—129)

1. An air-conditioning unit comprising a ventilating unit for transferring air in a confined stream optionally from either of two separate spaces into an independent space; a refrigerating unit for cooling the air of one of said separate spaces while the ventilating unit is transferring air from the other to said independent space, said ventilating unit having a ventilating fan for drawing air from said separate spaces and discharging it into said independent space and having valve means at the intake side of said fan for confining the suction of said fan to one of said separate spaces at a time, said valve means being positionally adjustable for transferring the suction of said fan from one to the other of said separate spaces at will, and said refrigerating unit having a condensing coil disposed in the path of the air discharged by said fan, said fan having an air-moving capacity greater than that required for the necessary cooling of said condensing coil; and, means actuable by said valve means for controlling the operation of said refrigerating unit in response to the position of said valve means.

---

2,770,956
CUP WITH HANDLE
Christoph Achtziger, Weiden, Germany, assignor to Porzellanfabrik Weiden Gebrueder Bauscher, Zweigniederlassung der Lorenz Hutschenreuther Aktiengesellschaft in Selb, Weiden, Germany, a firm
Application September 12, 1952, Serial No. 309,245
Claims priority, application Germany November 15, 1951
1 Claim. (Cl. 65—13)

A flared bowl-shaped cup having a loop-formed handle of the same material as the cup and attached to the bowl, the handle of said cup having a vertical prolongation at the bottom end thereof with a vertical surface slightly above its lowermost end and a substantially horizontal surface of a length equal to the approximate width of the handle and spaced from the bowl so that when a plurality of the cups are stacked the rim of a lower cup will contact the bowl and the horizontal surface of the handle of the cup immediately above, with the vertical prolongation of the handle of an upper cup extending into the bowl of the lower cup, said handle above the vertical prolongation projecting upwardly and outwardly to provide a small space between adjacent handles one above the other, and said rims of the cups when stacked being substantially horizontal.

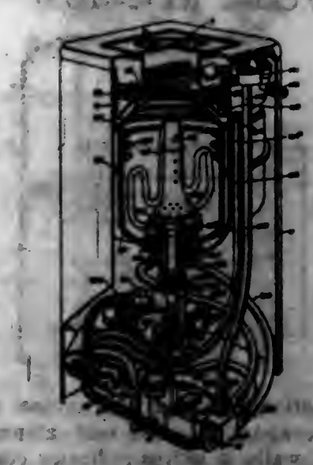
2,770,957
**DRIP-PREVENTING SAUCER**
Earl D. Bronson, San Diego, Calif.
Application September 27, 1954, Serial No. 458,460
2 Claims. (Cl. 65—15)

1. A drip-preventing saucer comprising a dished element having a base, and an upwardly and radially outwardly sloping annular wall disposed peripherally of said base and integral therewith, a raised boss on said base substantially concentric with said wall, a cup-receiving socket in said boss, a depressed reservoir within said socket, said socket having a cup-supporting shelf sloping inwardly and downwardly to the top of said reservoir, an annular trough substantially concentric with said reservoir and laterally defined by said boss and said wall, and a plurality of open-topped channels in said boss interconnecting said trough and said reservoir.

2,770,958
**MAGNETIC HOLDER FOR PAPER CUPS**
Herman Carew, Easton, Pa., assignor to Dixie Cup Company, Easton, Pa., a corporation of Delaware
Application July 16, 1952, Serial No. 299,287
9 Claims. (Cl. 65—61)

1. In a holder for a paper cup, a tubular body part having a passage therethrough and having a cavity therein to receive a paper cup, and a magnet mounted in said holder and having a portion thereof fronting into said cavity to attract magnetic material on a received cup.

2,770,959
**STRAIGHT BAR KNITTING MACHINES**
Ernest Start, Willford, Nottingham, England, assignor to William Cotton Limited
Application April 24, 1953, Serial No. 350,846
Claims priority, application Great Britain June 23, 1952
8 Claims. (Cl. 66—110)



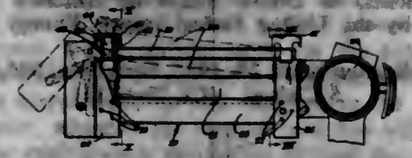
1. In a Cotton's patent or other straight bar knitting machine having jack sinkers and a row of jacks therefor movable forwardly and rearwardly behind the jack sinkers and between extreme limits, the combination of abutment means on the jacks, movable stop means operable to engage behind said abutment means and positively locate the jacks in a position intermediate said extreme limits, means for operating the movable stop means, a slurcock movable behind the jacks along the row thereof, and forward shallow concave jack-engaging edges on the slurcock which are in such relation to said intermediate position that, when the slurcock moves along the jacks positively located by the stop means in said intermediate position, the jacks are substantially uniformly accelerated by the slurcock from rest.

2,770,960
**FLINT AND STEEL ASSEMBLY FOR CIGARETTE LIGHTER**
Frederick W. Renwick, Sr., Maple Shade, N. J.
Application September 19, 1955, Serial No. 535,038
5 Claims. (Cl. 67—7.1)

1. In a cigarette lighter including a casing having a top panel, a flint and steel assembly comprising a steel in the form of an abrasive wheel fixedly mounted in said casing and having a portion projecting above said top panel, a pair of spaced brackets upstanding from said panel, and a flint unit rotatably and slidably mounted in said brackets, said unit including a rotary flint disc and a thumbwheel in driving relation with respect to said disc.

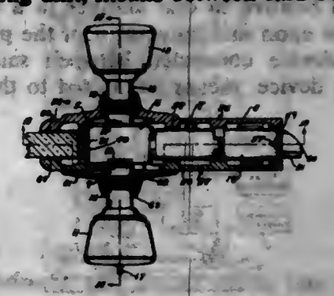
2,770,961
**WASHING MACHINE**
Evan Hartley Stevenson, John W. Ramore, and Griffith J. Hughes, Fergus, Ontario, Canada, assignors, by mesne assignments, to Graham and Barker, Ridgewood, N. J., a limited partnership of New Jersey composed of George C. Graham, Donald B. Graham, and George H. Barker
Application August 11, 1951, Serial No. 241,416
5 Claims. (Cl. 68—21)

1. A washing machine for clothes and the like comprising a container in which the clothes, washing and rinsing liquids are maintained during the washing, rinsing and drying operation, means for agitating the clothes in the container during washing and rinsing, a drain outlet in the upper portion of the container through which liquids and suspended and floating foreign matter can be discharged from the container, means for admitting rinse water into the lower portion of said container to discharge said washing liquid and suspended and floating foreign matter through the drain outlet and to rinse the clothes, means retarding the mixing of the rinsing liquid with the washing liquid and means for expelling liquids from the clothes, after rinsing and to damp dry the clothes.



2,770,962
**THREAD-ADVANCING REEL**
Kenneth M. McLellan, Cleveland, Ohio, assignor to Industrial Rayon Corporation, Cleveland, Ohio, a corporation of Delaware
Application May 15, 1952, Serial No. 287,909
3 Claims. (Cl. 68—205)

1. A thread-advancing reel for processing thread comprising, two reel members each having a periphery of longitudinally extending bar members, said reel members being arranged in an interdigitating relation about axes that are eccentric to each other so that upon rotation thread is advanced in the form of a helix over the reel periphery, an enclosed chamber in one of said reel members, means for supplying a treating fluid to said chamber, exhaust passages for said treating fluid from said chamber having outlet openings along the sides of the bar members, said outlet openings directing the flow of the treating fluid from the chamber along the sides of the bar members to thread on the reel.



2,770,963
**WRINGER**
Nicholas L. Etten, Waterloo, Iowa, assignor, by mesne assignments, to Chamberlain Corporation, Waterloo, Iowa, a corporation of Iowa
Application January 23, 1953, Serial No. 332,841
7 Claims. (Cl. 68—262)

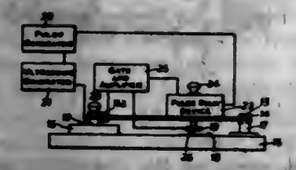
1. In a wringer including a frame and upper and lower rolls thereon relatively movable between a roll pressure released position and a roll pressure applied position, a roll-support member acting at one end of said upper roll, a link between said roll-support member and said frame, a reset member pivotally connected to said link, a second link between said reset member and said frame, said reset member being actuatable between a roll pressure releasing position and a roll pressure-applied position with the axes of pivotal connection between said first link and said frame and between said reset member and said first and second links lying in over-center locking relation, and release means supported with said upper roll for pivotal movement about the axis thereof and engageable with said reset member to actuate the same in a direction toward said pressure-releasing direction.

2,770,964
**ADAPTER HOUSING FOR DOOR LOCKS**
Lyford C. Bigelow, New Britain, Conn., assignor to The American Hardware Corporation, New Britain, Conn., a corporation of Connecticut
Application October 29, 1953, Serial No. 388,956
20 Claims. (Cl. 70—461)

2. For a cylindrical door lock including an operating unit and a latch with the said operating unit including a case having an inner and an outer sleeve extending coaxially therefrom; an adapter housing for mounting said door lock on a door that is thinner than the case, said adapter housing including an inner and an outer plate having co-axial openings therein to receive said sleeves and each plate containing a recess in its face providing a space between said plates which is greater than the thickness of the door and is adapted to accommodate the case of the operating unit, means between said outer plate and

the outer sleeve securing the operating unit to the outer plate, means on each of said plates co-axial with said openings for aligning the plates and containing the case of the operating unit, means for securing the latch unit between said plates and in operative position relatively to the operating mechanism in said case, and means cooperating with a threaded portion on the inner sleeve for urging the inner plate against the door to thereby force both of said plates securely against the opposite sides of the door through tension applied to the operating unit.

2,770,965
**INSULATED HOLLOW BUILDING PANEL**
David Engel, Hyattsville, Md.
Application August 4, 1952, Serial No. 302,580
2 Claims. (Cl. 72—41)



2. In a building structure unit, a hollow panel embodying a pair of confronting precast hollow sections, laterally extended marginal flanges formed on said hollow sections, the marginal flanges of adjacent sections being disposed in alignment and fused together along their contacting edges, layers of insulating material lining the inner surfaces of said precast hollow sections, socket members circular in cross section having tapered inner surfaces, extending from and forming a part of the insulating lining of one section, solid cone-shaped extensions integral with the insulating material of the other hollow section, and said extensions of said other section extending within and bearing against the walls of said socket members of the cooperating section bracing said sections with respect to each other.

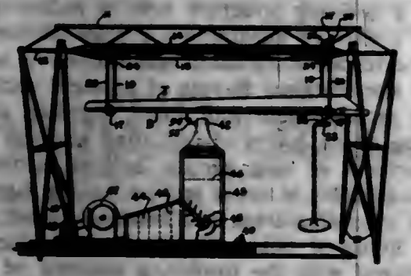
2,770,966
**APPARATUS FOR NON-DESTRUCTIVE TESTING OF SOLID BODIES BY ACOUSTIC OSCILLATIONS**
William Halliday and Herbert Martin Jefferys, Bottingdale, England, assignors to Kelvin and Hughes Limited, Glasgow, Scotland, a company of Great Britain
Application December 12, 1952, Serial No. 325,982
Claims priority, application Great Britain December 13, 1951
12 Claims. (Cl. 73—67.9)

1. Recording apparatus for use in recording non-destructive acoustic tests of bodies comprising, a probe for

transmitting pulses of acoustic oscillations to a body to be tested and for receiving reflected oscillations, an oscillation generator connected to said transducer for energization thereof to produce said pulses of acoustic oscillations, means for moving said probe over the surface of such a body, a marking device including a pen, a recording material, means drivably connected with said probe moving means for moving said recording material and said pen relative to one another in a first direction in dependence upon said movement of the probe, an electronic gate device connected between said probe and said marking device, means connected to the gate device

for applying thereto a gating pulse for each transmitted pulse of acoustic oscillations, each gating pulse being capable of opening the gate to permit the passage therethrough from the probe to the marking device of reflected oscillations having a time of occurrence coinciding with said gating pulse, means for varying the phase of gating pulses relative to the respective pulses of acoustic oscillations, and means drivably connected with said phase varying means for moving the recording material and said pen relative to one another in a second direction transverse to said first direction in dependence upon changes in the phase of the gating pulse.

---



2,770,967

**DEVICE FOR MEASURING THE AERODYNAMIC PITCHING MOMENTS OF A SHORT LENGTH OF A FULL SIZED AIRFOIL**

Stephen du Pont, Westport, Conn., assignor to Doman Helicopters, Inc., Danbury, Conn., a corporation of Delaware

Application November 16, 1953, Serial No. 392,330

14 Claims. (Cl. 73—147)

1. A device, for measuring the aerodynamic pitching moment of an airfoil section of a full sized airfoil having an aerodynamic center, comprising a frame, supporting mechanism for the airfoil section carried by the frame including at least two spaced support cradles to support the full sized and full length airfoil horizontally and having freedom of movement laterally with respect to the airfoil and angularly about the approximate aerodynamic center of the airfoil section, means to adjust the angular position of one of the supporting means about the aerodynamic center of the airfoil, means to measure the turning moment of the airfoil section in its supporting means, a jet mechanism having a nozzle of narrow width with respect to the airfoil length directed towards the leading edge of the airfoil, and means mounting one mechanism relatively to the other for movement to present the length of the airfoil to the jet from the nozzle.

2,770,968

**MASS FLOW MONITOR**

John Constantine Grey, Isleworth, England, assignor to Power Jets (Research & Development) Limited, London, England, a British company

Application June 6, 1952, Serial No. 292,085

Claims priority, application Great Britain June 18, 1951

2 Claims. (Cl. 73—205)

1. In a fluid mass flow monitor having separate means for responding to changes in absolute pressure of the fluid passing through a duct, to changes in absolute temperature of that fluid and to changes in pressure difference across a constriction in said duct adjacent the points from which the pressure and temperature responses are initiated, each of which responsive means incorporates a member moved substantially linearly by any change in the appropriate monitored variable, a symmetrical three-legged floating beam pivotally attached at the outer end of each leg to a different one of said members, the pressure and pressure difference responsive members affecting the beam in the opposite sense to the temperature responsive member, an indicating arm pivotally attached to the center point of said beam so that it moves substantially linearly an amount equal to the algebraic sum of the movements of the three members incorporated in the responsive means.

---

2,770,969

**FLUID FLOW METER AND CONTROLLER**

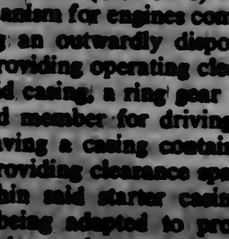
Rogers S. Cannell, Palo Alto, Calif., assignor, by mesne assignments, to United States of America as represented by the United States Atomic Energy Commission

Application April 29, 1955, Serial No. 505,073

5 Claims. (Cl. 73—211)

1. In combination with a cross type pipe fitting, a bore tube bridging opposed inlet and outlet horizontal arms of said fitting, a vertical pressure tube extending transversely through said bore tube to form a flow restriction therein, first port means disposed in said pressure tube transverse to said bore tube at said flow restriction, second port means disposed in said bore tube adjacent said inlet arm and communicating with the lower arm of said fitting, a closed end tubular means extending downwardly from said lower arm of said fitting, and an opened end tubular means extending downwardly from said pressure tube in coaxial relation with said closed end tubular means with a conducting liquid partially filling both tubular means to form a manometer for indicating pressure differentials between said bore tube and said pressure tube.

---



2,770,970

**LUBRICATING DEVICE FOR GAS METERS**

Heinrich Wlotzfeld, Munich, Germany, assignor to Kenneth Robert Marston

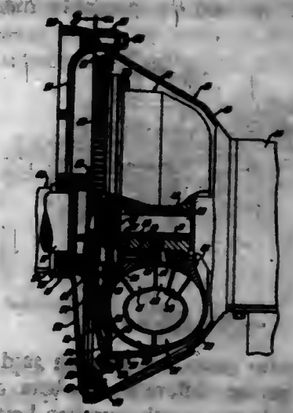
Application July 7, 1953, Serial No. 366,589

2 Claims. (Cl. 73—272)

1. In a gas meter, a casing having an upper portion, a doubly inclined intermediate bottom having passages for the gas to be metered, said intermediate bottom being fixed inside of said casing, pins on said intermediate bottom, each being disposed adjacent one of said passages, slide plates rotatably arranged upon said pins, driving means connected with said slide plates to cause them to oscillate in such a manner as to uncover said passages alternately, a reducing gear train connected with said driving means, an upper bottom fixed inside said casing in the upper portion thereof to form a container for a lubricant, a lubricant outlet valve disposed in said upper bottom, opening means for said valve connected with said reducing gear train to lift said valve periodically to permit a predetermined portion of the lubricant to escape from said container, said opening means including a rotating disc coupled to said reducing gear train and operated thereby, said rotating disc having a groove in the circumference thereof, a cam fixed to said disc and rotating therewith, said valve being provided with an extension projecting therefrom and having a spiral groove along its circumference, and a hollow guide for the extension of said valve and fixed to said upper bottom, said rotating disc being disposed below and adjacent to the extension of said valve, whereby the cam of said disc will lift said valve once during each revolution of said disc to admit lubricant to said spiral groove, said rotating disc being further disposed to direct the lubricant in the form of droplets to lubricate said slide plates.

---

2,770,971



**FLYWHEEL, CLUTCH AND STARTER HOUSING DRAIN**

Harry C. Deane, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application December 7, 1951, Serial No. 260,419

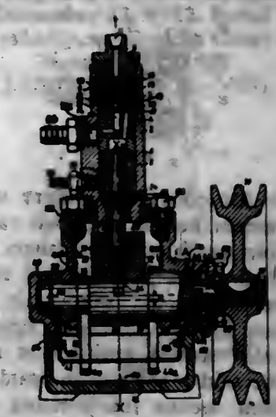
5 Claims. (Cl. 74—6)

1. A driving mechanism for engines comprising a rotatable member having an outwardly disposed casing disposed thereon and providing operating clearance between said member and said casing, a ring gear associated with the periphery of said member for driving said member, an engine starter having a casing containing the mechanism thereof and providing clearance space around said mechanism and within said starter casing, one end of said starter casing being adapted to project within an opening in said member casing and being provided with an opening at one side of said end and within said member casing through which the driving pinion of said mechanism extends into engagement with said ring gear, and a passage formed in said casing and extending between the lower extremities of said starter casing and the interior of said member casing for draining fluid

from the interior of said starter casing into said member casing.

---

2,770,972



**CRANKPIN-PISTON CONNECTING MEANS**

Jean Louis Gratzmuller, Paris, France

Application February 3, 1954, Serial No. 408,008

Claims priority, application France February 5, 1953

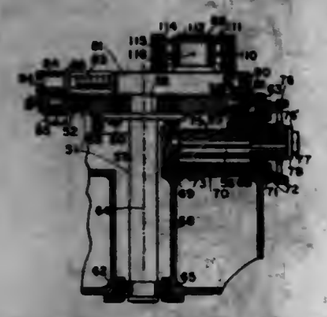
3 Claims. (Cl. 74—49)

1. A driving connection between a crankshaft and an elongated reciprocatory member of circular cross-section having one end portion provided with a diametrical perforation, comprising a disc-shaped member provided with two axially extending parallel bores one of which is adapted to engage the crank of said shaft, a pivot pin positioned in the other bore and provided with a diametrical hole adapted to receive said perforated end portion of the reciprocatory member with lateral play therebetween, a tangential slot in said disc-shaped member extending transversely to said pivot pin to permit insertion of said perforated end portion through said slot into said hole, said slot having such a length as to permit arcuate oscillation of said disc-shaped member with respect to said reciprocatory member, a second diametrical hole in said pivot pin extending at right angles to the first-mentioned hole thereof, and a gudgeon pin adapted to be thrust through said second hole and through said perforation to connect the reciprocatory member to said disc-shaped member for driving purposes while permitting relative swivel motion of said members for adjusting purposes.

---

2,770,973

**MECHANICAL MOTION MECHANISM**



Ernest Wildhaber, Brighton, N. Y.

Application May 24, 1954, Serial No. 431,733

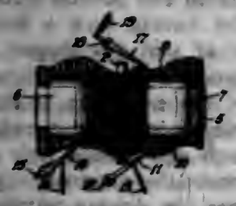
26 Claims. (Cl. 74—89)

1. In combination, a reciprocable member, and means for reciprocating said member comprising a rotary crank

member, a crank pin adjustable thereon to different distances from the axis of said crank member and operatively connected to said reciprocable member, and a

pair of varying ratio gears for turning said crank member, said gears having different numbers of teeth, and the gear with the larger tooth number being rigidly secured to said crank member.

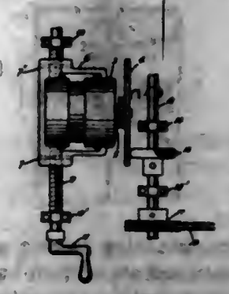
---



**2,770,974**
**DEVICE FOR PRODUCING RECIPROCATING MOVEMENT FROM ROTARY**
Werner Jacobs, Kitzingen am Main, Germany
Application June 14, 1952, Serial No. 293,615
4 Claims. (Cl. 74—84)

1. In a device for converting rotary motion into reciprocating movement having two ball races and a plurality of revoluble antifriction members interposed between the two ball races, a plain ball race, means for imparting movement to the said plain ball race, an undulated ball race loosely positioned opposite said plain ball race, mutually spaced antifriction members interposed between the said plain and the said undulated ball races, and resilient means for pressing said undulated ball race in the direction of said plain ball race.

---



**2,770,975**
**SERVO MECHANISMS**
Gordon William Galley, Wavertree, Liverpool, England, assignor to Unilever Limited, Port Sunlight, England, a British company
Application November 8, 1954, Serial No. 467,471
Claims priority, application Great Britain
November 10, 1953
9 Claims. (Cl. 74—96)

1. A servo mechanism comprising in combination a rotatable member having a plurality of channels substantially equally spaced on a substantially common pitch circle, a plurality of rods one situated in each channel, means for securely holding the rods in their channels to prevent axial displacement of the rods over an arc of said pitch circle, said rods being capable of axial displacement over the remaining arc of said pitch circle, signal input means arranged to displace the rods axially in said remaining arc, signal output means arranged to be displaced by the rods in the securely held arc, and aligning means in line with or in front of the signal input means to move the rods axially in said remaining arc towards the signal input means.

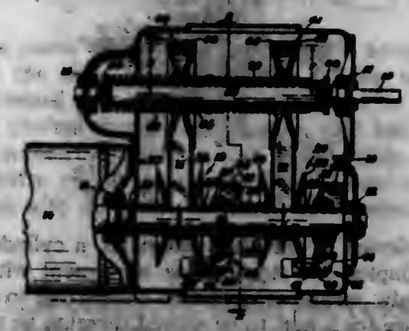
---

**2,770,976**
**VARIABLE SPEED DRIVE MECHANISM**
Frederick H. Frantz, Binghamton, and Werner O. Schink, Johnson City, N. Y., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware
Application August 29, 1955, Serial No. 531,163
3 Claims. (Cl. 74—194)

1. A variable speed friction drive including a motor having a shaft and a friction disk attached to the front end thereof, means for suspending said motor for pivotal movement in a direction perpendicular to said shaft and for displacement in a direction horizontal thereto, a driven wheel frictionally engaging said disk by virtue of the weight and pivotal movement of said motor, a driven shaft keyed to said wheel and extending in a direction parallel to the displacement of said motor whereby upon said displacement the position of said wheel may be altered along the radius of said disk for varying the speed of said driven shaft, the direction of rotation of said disk being such as to produce a force tending to move said motor on said pivotal support toward engagement with said wheel, thereby increasing the frictional contact therewith.

---

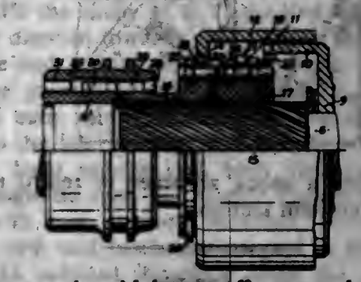
**2,770,977**
**BELT TRANSMISSIONS**
Richard Beckadolph, Grasdorf Hannover, and Walter Niclas, Altwarmbuchen Uber Hannover, Germany, assignors to Continental Gummi-Werke Aktiengesellschaft, Hannover, Germany
Application November 27, 1953, Serial No. 394,840
4 Claims. (Cl. 74—229)



1. In combination with an endless flat belt of rubber or rubber-like material: a rotatable pulley engaging said belt and having its circumferential area provided with a plurality of rows of teeth, said teeth respectively extending substantially parallel to the axis of rotation of said pulley, and the teeth of one row being in alignment with the teeth of another row, said rows of teeth being separated from each other by a circumferential central groove extending in a continuous uninterrupted manner around the entire pulley, said belt having its inner surface provided with permament teeth evenly spaced from each other in circumferential direction and respectively extending substantially perpendicular to the longitudinal direction of said belt for meshing with the teeth of said pulley, the inner surface of said belt being provided with a central permanent bead directly intersecting the teeth of said belt and extending in longitudinal direction of said belt in substantial alignment with said circumferential groove, said bead and the teeth of said belt being integral with each other and with said belt and consisting of the same material as the latter.

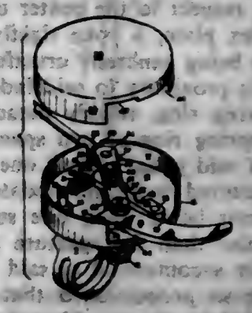
---

**2,770,978**
**MEANS FOR BALANCING THE LOADS ON PARALLEL BELTS**
Walter H. Troemel, Columbus, Ind., assignor to Reeves Pulley Company, Columbus, Ind., a corporation of Indiana
Application July 21, 1953, Serial No. 369,472
13 Claims. (Cl. 74—230.17)



1. In a device of the class described, a first shaft, a first pair of mating coned discs keyed on said shaft, an abutment element threadedly adjustably mounted on said shaft and engaged by one disc of said first disc pair to restrain said one disc against axial movement away from its mate, the other disc of said disc pair being axially movable toward and away from its mate, a second pair of mating coned discs keyed on said shaft adjacent said other disc of said first disc pair, that one disc of said second disc pair adjacent said other disc of said first disc pair being axially fixed on said shaft, and the other disc of said second disc pair being axially movable toward and away from its mate, a second shaft substantially parallel to said first shaft but spaced therefrom, a third pair of mating coned discs keyed on said second shaft in substantial radial alignment with said first disc pair, that one disc of said third disc pair opposite said other disc of said first disc pair being axially fixed on said second shaft and the other disc of said third disc pair being axially movable toward and away from its mate, means resiliently engaging the last-named disc to urge it toward its mate, a fourth pair of mating coned discs keyed on said second shaft in substantial radial alignment with said second disc pair, a second abutment element threadedly adjustably mounted on said second shaft and engaged by that one disc of said fourth disc pair opposite said other disc of said second disc pair to restrain the same against axial movement away from its mate, the other disc of said fourth disc pair being axially movable toward and away from its mate, means resiliently engaging the last-named disc to urge it toward its mate, a first edge-active belt providing a driving connection between said first and third disc pairs, and a second edge-active belt providing a driving connection between said second and fourth disc pairs, and means providing an operative connection between said other discs of said first and second disc pairs for synchronous adjustment of said discs toward and away from their mates.

---

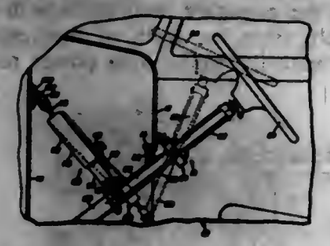


**2,770,979**
**CHANGE-SPEED GEARING**
Harold Sinclair, Windsor, England
Application January 22, 1954, Serial No. 405,574
Claims priority, application Great Britain
January 9, 1951
9 Claims. (Cl. 74—339)

1. Change-speed gearing comprising at least two first toothed members, a second member and two intermediate toothed members associated one with each of said first members and constrained for helical movement on said second member for engaging their teeth with and disengaging their teeth from the teeth of the respective first members for selectively establishing power paths of different ratios, each said intermediate member being provided with a ratchet drive for establishing driving engagement of the intermediate member with the respective first member without clashing, and the ratchet drives of the two intermediate members being of opposite hand.

---

**2,770,980**
**VARIABLE SPEED GEAR CONTROL LEVER MECHANISM FOR BICYCLES AND LIKE VEHICLES**
Edward Arthur Millward, Smethwick, Birmingham, England, assignor to J. A. Phillips and Company Limited, Birmingham, England, a British company
Application December 22, 1952, Serial No. 327,180
Claims priority, application Great Britain
November 7, 1952
3 Claims. (Cl. 74—489)



1. Variable speed gear control lever mechanism for bicycles and like vehicles comprising a support, a bar fixed on said support, a series of notches along an edge of the bar, a lever pivoted about a fixed point on the support, a link having one end thereof pivotally connected to said lever and the other end thereof extending to the side of said bar remote from said lever, means for attaching said other end of said link to the transferring element of a variable speed gear, notch-engaging means carried by said link, and means for resiliently drawing said notch-engaging means into engagement with the notched edge of said bar whereby said notch-engaging means can be selectively engaged in any one of the notches by angular movement of the lever about its fixed pivot and relatively to the fixed bar.

---

**2,770,981**
**ADJUSTABLE STEERING COLUMN**
Herman P. Fisher, Toledo, Oreg.
Application August 3, 1955, Serial No. 526,108
5 Claims. (Cl. 74—493)

1. An adjustable steering column assembly comprising a lower column section, means for anchoring said lower column section, an upper column section, a pivotal fitting connecting said upper column section to said lower column section, a lower steering shaft section journaled in said lower column section, an upper shaft section journaled in said upper column section, a universal fitting connecting said upper shaft section to said lower

shaft section, and means connected to said pivotal fitting to retain said upper column in a selected position, said

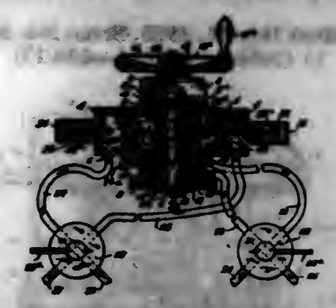
means including a shock absorber to retard movement of said upper column section.

---

2,770,982
INDEX MECHANISM
Edward J. Mastney, Berwyn, and John H. Williams, Barrington, Ill., assignors to Oak Mfg. Co., a corporation of Illinois
Application December 6, 1952, Serial No. 324,586
1 Claim. (Cl. 74—527)

An index mechanism comprising an index plate having a number of index deformations disposed along the arc of a circle with respect to the center of a shaft passing through the index plate, a yoke rigidly attached to the shaft, said yoke being generally cruciform in shape and being disposed in proximity to said index plate, a generally circular spring ring, readily detachable means for mounting said spring ring at two spaced points on two opposed arms of said yoke, at least one of the remaining arms being apertured to accommodate a ball bearing, said opposed arms being on a line substantially closer to the shaft center than the aperture in one of the remaining arms for accommodating said ball bearing, said yoke arm being so proportioned that the ball bearing rides the index deformations, said spring ring passing underneath the two ring attaching fingers of the yoke and lying over the remaining two arms of the yoke.

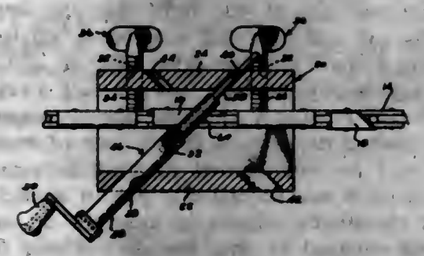
---



2,770,983
KNOB
John Hatala, Flushing, N. Y.
Application October 7, 1955, Serial No. 539,176
7 Claims. (Cl. 74—553)

1. A control knob for use with an electronic instrument control shaft, comprising an inner body portion of insulating material having slight resilience, the body portion having a cylindrical hole axially therethrough for a reception of a complementary end of the control shaft, a pair of ears defined by a slot perpendicular to the shaft axis of the hole and extending to the outside of one end of the body portion, screw means arranged in the ears for drawing them together to effect a consequent reduction in the diameter of the hole and a clamping grip of the wall of the hole upon the shaft that may have been received in the hole, and an outer portion fronting the body portion, the outer portion having one end integral with the body portion and the other end extending over the body portion in parallel relation thereto in close proximity to the hole and to the pair of ears.

---



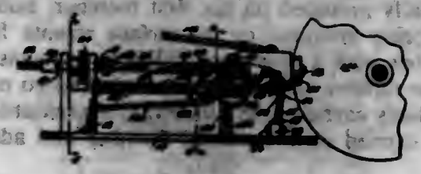
2,770,984
HYDRAULIC INFEED UNIT
Joseph Leecy, Jr., Euclid, Ohio
Application May 10, 1954, Serial No. 428,727
8 Claims. (Cl. 74—815)

1. In a device of the class described, a cylinder body, a piston adapted for straight-line movement within said cylinder body, means of operative connection to one end of said piston for a part to be moved thereby, an auxiliary piston adapted for straight-line movement to different predetermined positions of adjustment within said cylinder body and transversely of the axis of said first-named piston and having an inclined portion adapted for correspondingly predetermined positions of adjustment for operative engagement by the other end of said first-named piston for determining the length of stroke of said first-named piston, and fluid means adapted for application to said pistons for effecting actuation of said pistons.

---

2,770,985
CHAIN SAW SHARPENER
Arthur W. Pearce, Libby, Mont.
Application February 11, 1955, Serial No. 487,599
2 Claims. (Cl. 76—37)

1. In a chain saw sharpener, a channel-shaped frame comprising a web and first and second side walls serving as guides, said guides having free edges remote from the web, a first pair of aligned bores in the guides arranged diagonally with respect to the length of the frame, a second pair of aligned bores in said guides disposed at right angles to the first pair of bores, said pairs of bores being positioned between the web and the free edges of the guides, a jaw on said first guide between the bores and the free edge of the first jaw, a screw threaded through the second guide opposite said jaw, and a rotary abrading implement journaled in a selected one of the pairs of bores carrying an abrading cylinder between the guides.



---

2,770,986
AGRICULTURAL DISC SHARPENER
Charles S. Bass, Plainview, Tex.
Application March 13, 1953, Serial No. 342,091
5 Claims. (Cl. 76—82.2)

1. A disc sharpener for discs which are rotatably supported by an implement frame comprising a frame, a

head pivotally mounted on the frame, rotary shafts mounted in the head at a slightly divergent angle, a pair of side by side pressure rollers on said shafts adapted to straddle a disc and engage the opposing faces thereof adjacent its edge, said head being pivotable about an axis substantially transverse to the axis of rotation of the

rollers to move the rollers nearer to and away from the edge of the disc, and means for moving said rollers bodily toward and away from each other to adjust the pressure exerted thereby on the disc, said last means including eccentric sleeves in said head within which the roller shafts rotate, gears on said sleeves, and worms enmeshed with the gears to rotate the sleeves.

---

2,770,987
SPINNERETTE MANUFACTURE
John A. Cupler II, Cumberland, Md.
Application December 31, 1953, Serial No. 401,601
7 Claims. (Cl. 76—107)

1. A method of finishing the discharge surface of a spinnerette containing an orifice and having a composition whose grain size is reduced by cold working, comprising inserting a plug having a complementary cross section through said orifice to project beyond said surface, applying a compacting force to said surface contiguous to said plug sufficient to deform said surface, abrading said plug and said surface contiguous thereto until they become substantially coplanar, and mechanically removing said plug from a surface opposed to the discharge surface.

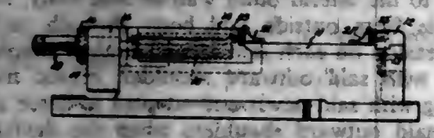
---

2,770,988
MISFIRED PROJECTILE EXTRACTOR
Joseph Raymond Jasse, Paris, France, assignor to Societe Nouvelle des Etablissements Brandt, Paris, France, a French body corporate
Application July 17, 1953, Serial No. 368,559
Claims priority, application France July 24, 1952
3 Claims. (Cl. 81—3.05)

1. Device for extracting after a misfire a projectile and its fuse from the tube of a muzzle-loaded mortar or other arm, comprising in combination: a cylindrical body having a forward plane transverse face and a transverse rear face; said body having a central cavity opening at least on said forward face, the walls of said cavity being adapted to surround said fuse without contacting it, even when said walls contact said projectile; said body having a plurality of radial slots between said cavity and the lateral outer wall thereof; the walls of each of said slots forming an outward shoulder; a gripping pawl in each slot and pivotable around an axis within said slot; the axis of all said pawls being located in a single transverse plane parallel to said forward face; each said pawl having substantially the shape of a T, the first branch of which is radially directed towards, and projects into, said central cavity, the end of said first branch being formed into a sharp edge parallel to said transverse plane; the second branch of each said T-shaped pawls being substantially parallel to the lateral outer wall of said body, and being accessible from outside said body through said slot; a heel extension on each said second branch adapted to cooperate with said outward shoulder; elastic means cooperating with said pawls and adapted to force said heels against said outward shoulders when the device is idle; said sharp edges of said pawls being located, when the device is idle, on a transverse plane located slightly rearwards toward the rear face of the body relative to the transverse plane of the axis of said pawls; whereby said sharp edges abut the fuse when said cavity receives said fuse and said projectile, and grippingly wedge against said fuse when said body is removed by traction from the tube.

---

2,770,989
WIRE CUTTING AND STRIPPING TOOL
Louis Bologna, Bronx, N. Y.
Application November 2, 1953, Serial No. 389,518
4 Claims. (Cl. 81—9.5)



1. A cutting tool comprising a handle and a shaft downwardly extending therefrom, a first tubular cylinder rigid with said shaft, a second tubular cylinder telescopically disposed with respect to said first cylinder and supported thereby, coupling means between said cylinders providing limited relative vertical movement therebetween and simultaneous rotational movement, a pair of opposed apertures in one of said cylinders forming guide means for a wire passed therethrough, cutting means depending from the other said cylinder in juxtaposition to one of said apertures, the limited relative vertical movement of said cylinders providing corresponding limited relative movement between the cutting means and the juxtaposed aperture from an open aperture position to a closed aperture position, said handle providing vertical control over said limited relative vertical movement, and a substantially flat member in downward dependence from one said cylinder adapted to be placed in a stationary slot to prevent rotation of said tool and to provide support therefor.

---

2,770,990
HOLD-DOWN VISE
Edward G. Rix, Wilmette, Ill., assignor to Stanley L. Shelter and Edward G. Rix, a copartnership doing business as Illinois Metal Products
Application July 13, 1955, Serial No. 521,733
7 Claims. (Cl. 81—38)

1. A vise for holding work on a work-supporting table of a machine tool, said vise comprising a pair of members movable inwardly toward and outwardly

away from each other, a pair of jaws, each having a work-engaging face, said jaws being pivotally mounted on respective ones of said members whereby each is freely pivotable inwardly and upwardly from an initial work-engaging position to a retracted position, the pivotal axes of said jaws being generally parallel to said work-supporting table and substantially above said work-engaging faces of said jaws when said jaws are in said initial work-engaging position, each of said jaws also being pivotable outwardly from said initial work-en-

gaging position to a full work-engaging position, spring means associated with said members, said spring means being arranged to resist movement of said jaw members from said initial work-engaging position to said full work-engaging position, means for preventing movement of said spring means beyond the position corresponding to the initial work-engaging position of said jaws, and a face on each of said members engageable by said jaws to prevent outward movement of said jaws beyond said full work-engaging position.

---

2,770,991

**SPANNER WRENCH FOR CALKS**

Robert E. Myers, Bangkok, Thailand

Application May 2, 1955, Serial No. 505,418

3 Claims. (Cl. 81—90)

1. A wrench for threadedly mounted calks, comprising, in combination, a spindle having a turning handle on one end portion and an integral enlarged cylindrical head on the other end portion, said head having a pair of diametrically opposite slots extending longitudinally of said spindle, like interchangeable I-shaped spanner dogs mounted one in each of said slots with the upright portion thereof in said slots and with transverse end portions of said dogs projecting in opposite directions and spaced from said head, said transverse end portions of said dogs being interchangeable, arcuate on the outer face, tapered on the outer end portions thereof and insertable in diametrically opposite openings in a convexo-concave calk, and a sleeve member threadedly and adjustably mounted on said spindle fitting over said head and retaining said spanner dogs in said slots, said wrench upon turning with said dogs in said calk openings adapted to seat and unseat said calks with said transverse end portions of said dogs between the calk body and sole bushing, locking said wrench in place.

---

2,770,992

**COPYING DEVICE FOR EXECUTING ARCUATE CUTS IN A PLANE PASSING THROUGH THE AXIS OF REVOLUTION OF A SLIDE LATHE**

Francois Retornaz, Marseille, France

Application February 6, 1952, Serial No. 270,248

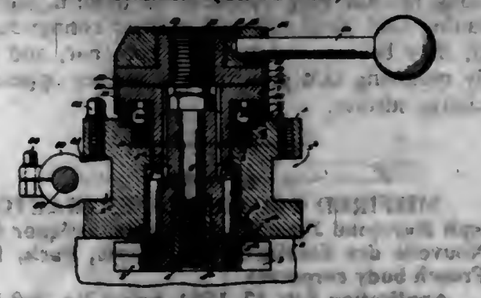
Claims priority, application France January 29, 1951

2 Claims. (Cl. 82—11)

1. A copying device for coupling to the usual tool holder of a lathe for constraining the tool to produce arcuate cuts in a work piece in the horizontal plane passing through the axis of revolution of a slide lathe, comprising a stationary bed plate adapted to be secured to the bed of the lathe, a first member carried by the bed plate and adapted to revolve thereon about an axis perpendicular to the axis of the lathe and passing through said last-mentioned axis, a second member revolvably and coaxially mounted on the first member, said second member being provided on its surface remote from the first member with a diametrical slideway, means for adjusting the relative angular position of the two members, a rule slidably carried in the slideway, a releasable clamping plate carried on the second member and adapted to

engage longitudinally along one edge of the rule parallel to its direction of movement to clamp the rule in fixed position in the slideway, a block adjustably carried by the rule and having a threaded bore the axis of which is parallel to the plane of the rule, a worm carried by the second member and engaged in said bore, said worm being rotatable with respect to the second member but prevented from axial movement with respect thereto, an upstanding spindle carried on the rule, and a link pivotably connecting the spindle to the usual tool holder to constrain the tool holder and tool, when actuated by the usual cross and axial feed means, to follow the movement of the spindle as determined by the position of the rule with respect to the axis of the lathe.

---



2,770,993

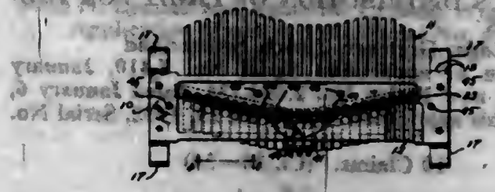
**TOOL SUPPORTING STRUCTURE**

Gordon L. Olson, Arlington, Mass.

Application March 25, 1953, Serial No. 344,568

2 Claims. (Cl. 82—36)

1. An improved tool support comprising a base presenting a center support extending upwardly therefrom and an intermediate portion of the center support provided with a cylindrical elongated splined surface, said base further having a turret seating surface constructed at the lower portion thereof, an indexing sleeve formed with a cylindrical splined internal surface which is secured in sliding relationship with the splined surface of the center support, said indexing sleeve having an upper annular gear portion forming a part thereof, a turret body rotatably mounted on the said seating surface and around the said indexing sleeve, a second annular indexing gear fixed to the turret body in a position to mesh with the said upper annular gear portion, spring means for moving said indexing sleeve and upper indexing plate out of engagement with the said lower indexing plate to provide for rotative indexing movement of the turret body while the latter member is retained in seated relationship upon the said seating surface, a cap member including an operating handle operatively connected with the upper end of the center support and adapted to move the upper and lower annular gear portions into engagement with one another.



2,770,994

**MUSICAL INSTRUMENTS WITH CAPACITATIVE PICKUP**

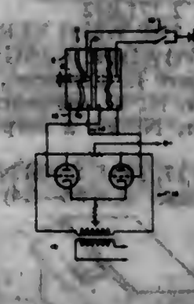
Jacob T. Kunz, North Hills, Pa., assignor to Schulmerich Electronics, Incorporated, Sellersville, Pa., a corporation of Pennsylvania

Application September 21, 1951, Serial No. 247,585

5 Claims. (Cl. 84—1.14)

1. In an electric music instrument, the combination including an elongated supporting block having a plurality of fixed-free rods mounted at longitudinally spaced points on said block, a plurality of apertures therein at predetermined locations over the length of the block, striker mechanism for selectively striking said vibrators, electric pick-up means adjacent each of said rods, amplifying means connected to said pick-up means, loudspeaker means connected to said amplifying means, and means selectively placeable in said apertures for detuning undesired resonant vibrations in any part of said block to control tone interference patterns.

---



2,770,995

**WAVE FORM GENERATOR**

George R. Stibitz, Burlington, Vt.

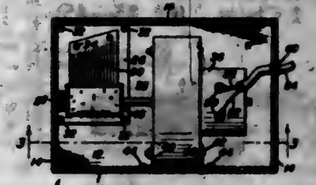
Application July 14, 1952, Serial No. 298,669

10 Claims. (Cl. 84—1.28)

1. A tone generator comprising a sound track consisting of a thin layer of conducting material in the form of an elongated strip longitudinally divided to produce two laterally displaced track components of substantially equal areas, the differential lateral extent of said components varying along the track in accordance with a desired tone output, means for applying an electric field to a discrete portion of said track laterally coextensive with said track, means for producing relative longitudinal motion between said track and said electric field, and a differential push-pull amplifier having two 180° out-of-phase circuit elements one of which is connected to each said track component in hum-balancing arrangement, whereby hum picked up by the total respective areas of said track components is balanced out, and the amplifier output is a function only of the differential variation in the laterally displaced areas of said discrete portion due to said relative motion.

---

2,770,996



**ELECTRICALLY DRIVEN MUSIC BOX**

Barbara A. Brodie, Las Cruces, N. Mex.

Application March 19, 1954, Serial No. 417,248

1 Claim. (Cl. 84—99)

An electrically driven music box comprising a housing having an open top, a cover pivotally mounted on said housing for selectively closing the same, a frame mounted in said housing, a plurality of musical projections mounted on said frame, a pin roll disposed within said housing and engageable with said projections, an electric

motor mounted in said housing, said electric motor having a driving shaft extending therefrom, said pin roll being fixedly secured to said drive shaft for rotation therewith.

---

2,770,997

**THREAD ARRANGEMENT FOR ENGAGED MALE AND FEMALE MEMBERS HAVING DIFFERENT COEFFICIENTS OF THERMAL EXPANSION**

Alfred J. Hansen, Milwaukee, Wis., now by change of name John A. Hansen, assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.

Application January 16, 1952, Serial No. 266,682

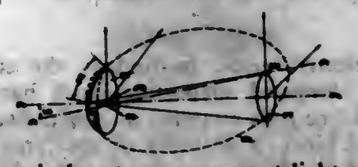
5 Claims. (Cl. 85—1)

1. A separable rigid structure including rigid frangible and rigid infrangible portions effectively combined for eliminating destructive stresses on said frangible portion throughout a wide temperature range, said structure comprising a female portion having a threaded section, a male portion having an enlargement at one end thereof and a complementary threaded section threadingly engaged with said female section, said male and female threaded sections respectively presenting helical first surfaces sloping radially inward and being axially inclined toward said enlargement, said first surfaces having parts clampingly interengaged at a substantially uniform clamping pressure throughout said temperature range, said male and female threaded sections also respectively presenting helical second surfaces sloping radially outward and being axially inclined away from said enlargement, said second surfaces being spaced radial and axial distances from each other when said parts of said first surfaces are clampingly interengaged at the lower end of said temperature range, said radial and axial distances being respectively equal to at least the difference between the radial and axial expansions of said threadingly engaged sections of said male and female portions within said temperature range, and a rigid intermediate portion disposed between said enlargement on said male portion and said threadingly engaged section of said female portion, said intermediate portion having substantially the same thermal coefficient of expansion as said thermal coefficient of expansion of said female portion and presenting an inner surface radially spaced from the opposed surface of said male portion, said intermediate portion further having an axial length substantially equal to the maximum radius of said threaded section of said male portion multiplied by the tangent of the angle defined between a perpendicular to the longitudinal axis of said male threaded section measured in an axial plane and one of said helical surfaces of an individual thread of said male threaded section.

2,770,998
**TAMPER-PROOF SCREW HAVING FRUSTO-CONICAL HEAD WITH FLAT TOOL ENGAGING FACETS THEREON**
Robert F. Schwartz, New York, N. Y.
Application December 15, 1954, Serial No. 475,372
1 Claim. (Cl. 85—45)

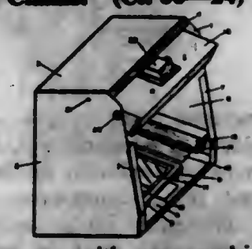
A substantially tamper-proof screw, comprising a solid threaded shank with a solid conical head integrally formed thereon, said head being generally in the form of a frustum of a cone with a flat top and a flat base, said threaded shank projecting axially from said base, and three non-parallel flat facets formed on said conical side of the head immediately adjacent said base in equally spaced relation to each other and occupying a relatively small portion of the height of the head, said facets being disposed on planes which are parallel to the longitudinal axis of said threaded shank, said facets merging throughout their entire length with the conical side of the head of the screw, said conical side of the head of the screw being disposed at an angle of approximately 55 degrees to the base of the head.

2,770,999
**AFTER-IMAGE APPARATUS**
Harry J. Older, Landover, Md.
Application August 6, 1952, Serial No. 302,860
2 Claims. (Cl. 88—28)



1. Apparatus for producing a predetermined and definitely intelligible visual after-image resulting from a continuation of receptor and neural processes after the discontinuance of a stimulus to the human eye, said apparatus comprising a pair of opaque panel areas having target openings for the penetration therethrough of light rays, a light source behind each of said opaque panel areas, said opaque panel areas being adjacently disposed whereby they may be successively viewed by an observer, the target openings in each of said opaque panel areas being arranged in a pattern which produces unintelligible indicia when said panels are viewed individually, but being so constructed with respect to each other that, when said panel areas are viewed in sequence, the target openings therein thereafter present an intelligible indicia due to said after-image effect.

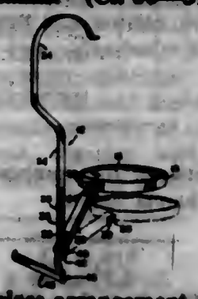
2,771,000
**GREASE SPOT PHOTOMETER**
George D. Crookston, Cleveland Heights, Ohio
Application May 19, 1954, Serial No. 430,809
3 Claims. (Cl. 88—23)



1. A portable photometer comprising a box with a window in the first of two opposite sides for admitting the light to be measured, an aperture in the second opposite side for observing the admitted light, a light source near one corner of the box adjacent the aperture, a light shield between the light source and the aperture, and a vertical partition in the box between the window and aperture comprising an indicator strip positioned opposite said corner and at an acute angle with the line of sight between the window and aperture.

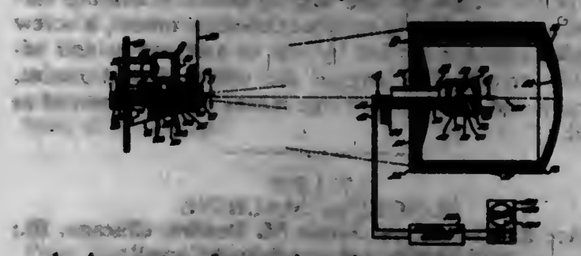
2,771,001
**OPTICAL ILLUMINATION SYSTEM WITH HOMOGENEOUS DISTRIBUTION OF LIGHT FOR PROJECTORS**
Edgar Gretener, Zurich, Switzerland
Continuation of application Serial No. 5,410, January 30, 1948, now Patent No. 2,624,234, dated January 6, 1953. This application September 29, 1952, Serial No. 312,119
10 Claims. (Cl. 88—24)

1. In an optical system, a compact light source having a substantial area located substantially on the optical axis of the system, an area to be illuminated, a concave reflecting light condensing means having a surface formed by the revolution of a segment of a conic section having an eccentricity other than zero so positioned that the principal axis of the conic section is displaced from the axis of rotation of the system, said light condensing means having a focal area corresponding roughly to the light emitting area of said source and acting to direct the elementary light beams originating in said source and impinging on said reflecting surface toward said area to be illuminated to form overlapping circles of confusion yielding uniform high efficiency illumination.

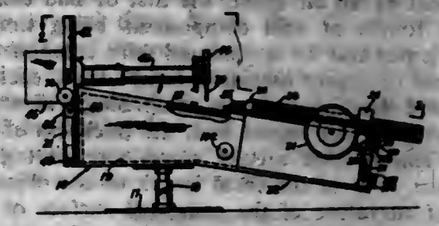


2,771,002
**APPARATUS FOR USE WITH XEROGRAPHIC X-RAY POWDER IMAGES**
Clyde R. Maye, Herbert E. Crumrine, and Joseph F. Rosenthal, Rochester, N. Y., assignors to The Haloid Company, Rochester, N. Y., a corporation of New York
Application June 17, 1954, Serial No. 437,526
3 Claims. (Cl. 88—24)

1. Apparatus for use with xerographic X-ray powder images comprising a cabinet having top, bottom, side and rear walls, said walls preventing external light from entering the cabinet and being reflected from the plate, xerographic plate-supporting means located above said bottom wall, lighting means consisting of tubular lamps arranged slightly above said plate-supporting means in spaced parallel relation to the side edges thereof and between said side walls and a central vertical plane parallel thereto, light shields located over said lamps in proximity and parallel relation thereto and extending from the side walls downwardly toward said plate-supporting means acting to direct light onto a xerographic plate and powder image on said plate-supporting means in a direction at a slight angle to the plate thereby preventing light from being reflected away from the plate in a direction perpendicular thereto, a camera located above the plate-supporting means with its longitudinal axis in the aforesaid vertical plane and perpendicular to the plane of said plate, a camera support movable from an inoperative position at the upper rear portion of the cabinet to an operative position at the upper front portion of the cabinet, and a curtain mounted on said camera support and positionable in the opening at the front of the cabinet when the camera is in operative position.



2,771,003
**MAGNIFYING GLASS ARRANGEMENT**
John N. Lyndall and Agnes M. Lyndall, Wyoming, Del.
Application March 4, 1954, Serial No. 414,158
5 Claims. (Cl. 88—39)

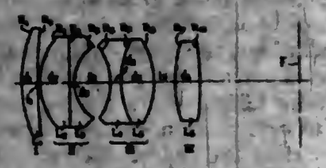


1. A magnifying glass arrangement, comprising, structure including an arm having one end thereof shaped to fit the general contour of the neck of a user, the other end of said arm having a slot provided therein along its longitudinal direction, slidably mounted supporting means in said slot, a magnifying glass, a second arm including structure for adjustably mounting said magnifying glass at one end thereof, with the other end of said second arm being pivotally mounted to said slidably mounted supporting means, a support bar having one end thereof pivotally mounted to said slidably mounted supporting means and so shaped that the other end thereof rests against the body of the user to properly space said magnifying glass to inhibit lateral movement thereof.

2,771,004
**APPARATUS FOR AND METHOD OF TESTING A PROJECTION OPTICAL SYSTEM**
Lawrence T. Sachtleben, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application April 29, 1953, Serial No. 351,983
13 Claims. (Cl. 88—56)

1. Apparatus for testing the quality of an axially aligned optical system adapted to project an image at its focal surface onto an image surface, said apparatus comprising an opaque plate, means to mount said plate in said focal surface, said plate being formed with a plurality of transparent slits, photoelectric means adjustably mounted on said mounting means in a position to receive light from said image surface, through said optical system, and through a selected one of said slits, a hollow drum formed with a plurality of parallel slots in its periphery, means to mount and to rotate said drum so that each slot passes through selected portions of said image surface when each of said slots is at its nearest distance to said optical system, a light source extending within said drum, means to project light from said source through said slots, through said optical system, and through said selected one of said slits, signal indicating means, and means to couple said photoelectric means to said indicating means, whereby to display the signal response of said photoelectric means to the light projected through said selected one of said slits.

2,771,005
**LENS-MEASURING APPARATUS**
Weldon R. Cozzell, Ellensburg, Wash.
Application October 4, 1955, Serial No. 538,337
3 Claims. (Cl. 88—56)



1. A lens-measuring apparatus comprising a base, a standard rising from said base, a horizontally-disposed platform supported intermediate its ends on said standard for rotational movement about said standard as an axis, a pedestal rising from said platform adjacent one end thereof, said platform having the portion between said standard and the other end thereof sloping in a direction upwardly from the other end, a focusing tube positioned above said platform sloping portion and extending parallel to said portion, means carried by said platform and supporting the end of said tube adjacent said standard for rocking movement about a horizontal axis parallel to said platform sloping portion, means carried by said platform and supporting said tube intermediate its ends for limited swinging back and forth horizontal movement and up and down vertical movement about said horizontal axis, a viewing and measuring screen spaced above and connected in communication with the interior of said tube intermediate its ends and extending parallel to said tube, a projecting mirror fixedly mounted in said tube for cooperation with said screen, a lens system mounted in said tube between said one end and said mirror, said system including a lens mounted in said tube for movement toward and away from said mirror, a pair of upstanding side walls rising from said platform inwardly of said pedestal, the upper edges of said walls sloping in a direction upwardly complemental to the sloping direction of said platform portion and being spaced below said tube, a light-projecting assembly including an upstanding casing, a horizontally-disposed tunnel member positioned so as to project from the front face of said casing and having one end connected in communication with said front face, and a light-projecting source connected in communication with the back face of said casing positioned so that the tunnel member extends horizontally over and spaced above the sloping upper edges of said walls, said assembly being connected to said pedestal for movement of the assembly from the position in which the tunnel member is horizontally above and spaced from the upper edges of said side walls to a position in which the tunnel member is in the space above the upper edges of said side walls with its other end in alignment with said one end of said tube, cooperating means carried by said side walls and said tunnel member for releasably holding the tunnel member in its end aligned position, support means inwardly of and adjacent said axis and carried by said platform for receiving a lens to be measured, and a lens carrying an astigmatic chart positioned in said casing and movable into position bridging said tunnel member adjacent said one end of the latter.

2,771,006
**HIGHLY CORRECTED PHOTOGRAPHIC OBJECTIVES COMPRISING FOUR AXIALLY AIR SPACED COMPONENTS**
Arnold Werfeli, Yverdon, Switzerland, assignor to Paillard S. A., Sainte-Croix, Switzerland, a corporation of Switzerland
Application April 12, 1955, Serial No. 500,937
Claims priority, application Switzerland May 5, 1954
3 Claims. (Cl. 88—57)

1. A photographic objective of high luminosity cor-

rected for spherical and chromatic aberrations, coma, astigmatism, distortion, and field curvature, comprising, in combination, four components in axial alignment, each of said components being separated from its adjacent component by an air space, the first of said components and the fourth of said components being simple convergent lenses and the second and third components being compound divergent meniscus components, each of said second and third components comprising a divergent lens cemented to a convergent lens, the thickness of the convergent lens of said second component having a value of at least 18% of the focal length of the objective, the radius of curvature of the cemented surface of the said second component having an absolute value greater than twelve times the focal length of the objective, the radius of curvature of the cemented surface of the third com-

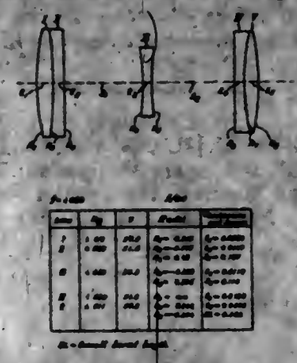
ponent having an absolute value between 55% and 75% of the focal length of the objective, the index of refraction of the divergent lens of the said third component being greater than the index of refraction of the convergent lens of said third component, the index of refraction of said convergent lens of said third component being at least equal to the index of refraction of the said fourth component, the index of refraction of said fourth component having a value greater than 1.70, the arithmetical average of the indices of refraction of said fourth component and of the divergent lens and convergent lens of said third component having a value of at least 1.72, whereby the spherical aberration is remarkably well corrected and does not exceed 0.1% of the focal length for a relative aperture of the objective having an equivalent focal length of at least 1.3.

---

**2,771,007**

**OBJECTIVES COMPRISING TWO OUTER POSITIVE DOUBLETS ENCLOSING A MIDDLE NEGATIVE COMPONENT FOR AERIAL PHOTOGRAPHY**

James G. Baker, Winchester, Mass., assignor to The Perkin-Elmer Corporation, Norwalk, Conn., a corporation of New York



Application January 15, 1953, Serial No. 331,349
2 Claims. (Cl. 88—57)

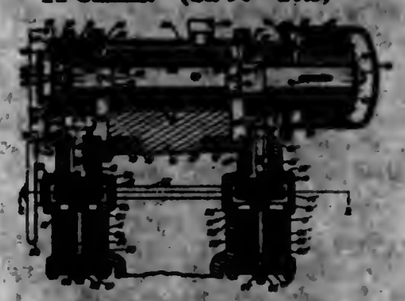
1. A lens having numerical data substantially as follows:

$f/=1.000 \quad f/6.0$

| Lens | $N_D$ | V | Radii | Thicknesses and Spaces |
|---|---|---|---|---|
| I | 1.611 | 57.2 | $R_1=0.315$ | $t_1=0.0629$ |
| | | | $R_2=-0.819$ | $t_2=0.0147$ |
| | | | $R_3=2.40$ | $S_1=0.107$ |
| II | 1.589 | 61.6 | $R_4=0.285$ | $t_3=0.0110$ |
| | | | $R_5=0.265$ | $S_2=0.114$ |
| III | 1.639 | 38.2 | $R_6=\infty$ | $t_4=0.0139$ |
| | | | $R_7=0.202$ | $t_5=0.0399$ |
| IV | 1.589 | 61.6 | $R_8=-0.304$ | $BL=0.262$ |
| V | 1.611 | 57.2 | | |

in which $R_1$, $R_2$, . . . represent radii of surfaces beginning at the left, $t_1$, $t_2$, . . . represent the axial thicknesses of the individual elements, $S_1$ and $S_2$ represent the axial

air separations between the components, and BL represents the overall barrel length.



---

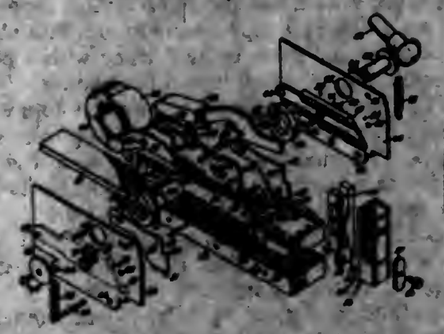
**2,771,008**

**MILLING MACHINES**

William F. Huck, Forest Hills, N. Y., assignor to Huck Co., New York, N. Y., a partnership of New York

Original application January 25, 1949, Serial No. 72,631, now Patent No. 2,658,424, dated February 10, 1953. Divided and this application November 6, 1952, Serial No. 319,150
11 Claims. (Cl. 90—20.5)

1. In a milling machine especially adapted for machining the reverse side of a flat printing plate, a milling cutter, a bearing-shaft means for supporting at least a part of the weight of said milling cutter, a bearing cartridge means enclosing said bearing-shaft means, a screw threaded member carried by one of said means and adjustably arranged to engage the other of said means, whereby said bearing cartridge means can be removed as a unit.



---

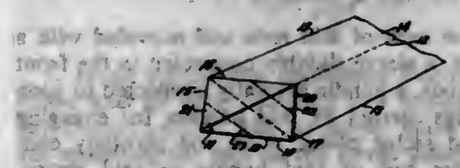
**2,771,009**

**PUNCHING MACHINE**

Wallace E. Carroll and James M. Bowles, Chicago, Ill.; said Bowles assignor to said Carroll

Application June 3, 1952, Serial No. 291,444
15 Claims. (Cl. 93—1)

1. In a machine of the character described, comprising means mounting a rolled web of adhesive tape; means to advance said tape a pre-determined distance with respect to a severing means; said tape advancing means comprising a movable jaw adapted to grip said tape therebetween to unwind the same from said roll and advance the pre-determined portion to be severed, a tape hold-down jaw adapted to hold said advanced tape in position during severance and until said movable jaw returns to initial tape gripping position, and a tape wiper member adapted to remove said tape from said hold-down jaw when the same adheres thereto; severing means adapted to sever a pre-determined end portion of said tape; punching and compression means adapted to receive a sheet of paper and the pre-determined end portion of said tape in overlying relation, and to punch holes through said sheet and end portion of said tape, and to compress the same into adhesively fixed relation; and means adapted to actuate said tape advancing means, and said severing, punching and compression means, in order substantially simultaneously to sever said tape portion, punch the same, together with said paper, and adhesively to secure them to each other.



---

**2,771,010**

**BAGMAKING**

Thomas E. Plarre, Mount Vernon, Ohio, assignor, by mesne assignments, to Continental Can Company, Inc., New York, N. Y., a corporation of New York

Application December 20, 1950, Serial No. 201,830
7 Claims. (Cl. 93—35)

6. A method of fabricating a bag from plain tubular material which is capable of having juxtaposed edges joined by a bead seam upon application of heat thereto, which method comprises transversely sealing with a bead seam one end of a length of said material, folding the length of material to bring the walls of the body thereof into flattened superimposed relation with the portions adjacent said bead seam being flattened into the plane of the flattened body portion by folding about a transverse line at right angles to said beam seal, dividing off triangular end portions of the bottom formation at opposite ends of said bead seam along spaced parallel lines extending at right angles to said bead seam, and providing bottom edge portions along said last mentioned lines whereby when said bag is opened up the bottom edges are in the form of a rectangle.

---

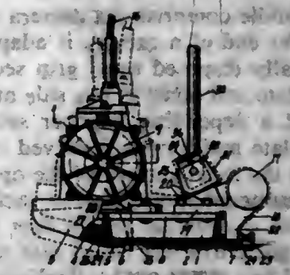
**2,771,011**

**BLANK COUNTING MECHANISM**

Peter Zernov, Milwaukee, Wis., assignor to Mercury Engineering Corporation, Milwaukee, Wis., a corporation of Wisconsin

Application September 21, 1953, Serial No. 381,355
5 Claims. (Cl. 93—93)

4. In a carton blank forming apparatus, the combination of an endless delivery conveyor for finished blanks, means for continuously driving said conveyor to advance the finished blanks along the same including a continuously rotating feed roll and an overrunning clutch, a settable predetermined number type counter, means for driving said counter, an angularly movable member, a one way clutch connection between said member and the shaft for said roll, a reciprocatory member, a link operatively connecting said reciprocatory member with said angularly movable member, a separate power source for said reciprocatory member to effect movement of said link, angular member and clutch to move said feed roll at a rate several times faster than the normal movement of said roll by said drive means and in the same direction to speed up the movement of said roll to produce a separation of blanks on said conveyor into readily separated batches, and means controlled by said counter to control said separate power source to provide batches of blanks of predetermined number.



---

**2,771,012**

**COMPACTOR FOR ASPHALTIC AND OTHER COMPACTABLE MATERIALS**

Corwill Jackson, Ludington, Mich., assignor to Jackson Vibrators, Inc., Ludington, Mich.

Application April 6, 1953, Serial No. 346,887
8 Claims. (Cl. 94—48)

1. In a machine of the class described, the combination of a vibratory shoe including a flat rear portion and a flat horizontally disposed front impact portion, the rear end of the impact portion being offset downwardly relative to the front end of the flat rear portion to provide a rearwardly facing shoulder extending transversely across the shoe in substantially spaced relation to its rear edge, vibratory means comprising an electric motor supportedly mounted on the shoe and having an unbalanced rotor disposed with its axis transversely of the shoe and in approximately the vertical plane of the front edge of said impact portion, said shoe having a plurality of openings therein adjacent the rear edge of its said impact portion positioned to discharge air forced therethrough by the vibratory movement of the shoe relative to the material treated against the motor to constitute a cooling medium therefor, and weighting means supportedly mounted on said shoe with its center of gravity substantially rearwardly of the rear end of the shoe.

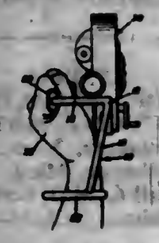
---

**2,771,013**

**STEREOSCOPIC CAMERA**

Gifford M. Mast, Davenport, Iowa, assignor to Mast Development Company, Inc., Davenport, Iowa, a corporation of Iowa

Application November 30, 1953, Serial No. 395,015
3 Claims. (Cl. 95—18)



1. In a stereoscopic camera, a casing, a pair of lenses carried thereby in relatively fixed interocular spacing, a film carrier including a forwardly extending section lying between the axes of said lenses, means guiding a film around said section, shield means forming a pair of film apertures carried by the film carrier and lying closely adjacent the film at opposite sides of said forwardly extending carrier section, means lying behind said lenses and reflecting the images formed by the respective lenses upon

the film behind said film apertures, and means for moving the film carrier and shield means in a direction substantially parallel to said forwardly extending carrier section to move the film and film apertures relative to the reflected axes of the pair of lenses.

---

2,771,014
CAMERA HANDLE
John M. Telcher, Denver, Colo.
Application July 21, 1953, Serial No. 369,491
3 Claims. (Cl. 95—86)

1. A camera handle comprising a camera support plate on which the lower end of a camera is adapted to be secured, a horizontally disposed hand grip secured to said camera support plate and offset at one side of said camera support plate and a depending member secured to said camera support plate and having a curved lower portion adapted to engage the inner surface of the operator's forearm to steady the camera handle.

---

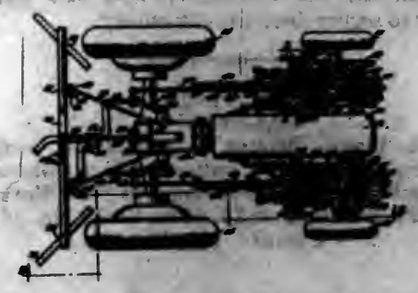
2,771,015
FILM DEVELOPING DEVICE
William J. Hall, Fort Worth, Tex.
Application February 19, 1954, Serial No. 411,455
3 Claims. (Cl. 95—90.5)

3. A film supporting device for use in a daylight developing tank comprising a generally circular box having an outer upstanding peripheral wall, an upstanding spiral rib similar in height to said outer peripheral wall and rigidly secured to the bottom wall of said box, said rib being substantially concentric with the box and having a substantial number of spiral turns spaced from each other to receive a strip of film to be developed and to support said strip between the turns, said bottom wall being apertured at its central and at its outer portions to allow developing liquid to enter the box, the surface of the bottom wall being arcuately curved upwardly from the lower end of one turn of the spiral rib to the lower end of the next adjacent turn to engage the bottom edge of the film strip and to prevent contact of the emulsion surface of the film strip with the surface of said next adjacent turn of the spiral rib, a circular cover engaged on the top rim of said box, said cover having a depending peripheral flange frictionally engaging over the top portion of said outer wall, said cover having a central aperture, and a handle member loosely secured in said last-named aperture.

---

2,771,016
CULTIVATOR ATTACHMENT FOR TRACTORS
Jerome Fillip, Ammansville, Tex.
Application August 5, 1954, Serial No. 447,968
1 Claim. (Cl. 97—47.34)

In combination, a tractor including a body, front wheels and rear wheels, a horizontally disposed mounting bar of cylindrical shape positioned rearwardly of said tractor and provided with a plurality of apertured ears, said ears being arranged in pairs, a yoke extending upwardly from said mounting bar and including a pair of angularly arranged legs, a lever having one end pivotally connected to said legs and its other end connected to said tractor body, a plurality of vertically disposed posts depending from said mounting bar, support members secured to the lower ends of said posts and adapted to support earth working implements, hydraulically actuated links connected to the tractor body, a pair of angularly arranged arms pivotally connected to the ears on said mounting bar, and pivotally connected to said tractor body, fingers extending between said links and said arms, a pin extending transversely with respect to each of said links, a pair of rods arranged on opposite sides of the tractor body and pivotally connected to said pins, a sector



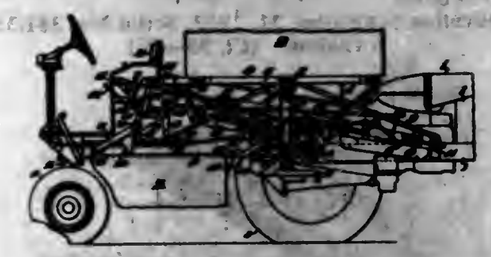


plate mounted on each of said rods and provided with a plurality of teeth, a sleeve slidably connected to the front of each of said rods, a handle pivotally connected to each of said rods, dogs carried by said handles for engaging the teeth of said sector plates, a tie rod pivotally connecting the lower end of said handle to said sleeve, brackets pivotally connected to the front of said sleeves, a base pivotally connected to the lower end of each of said brackets and said bases being secured to the tractor, a standard connected to each base, a strap secured to the lower end of each standard, an angle bar adjustably connected to each strap, a collar positioned below each angle bar, a substantially U-shaped body member having a web portion pivotally mounted in each collar and including rearwardly extending spaced apart fingers, lift rods extending from said brackets to said fingers, and earth working implements connected to said fingers.

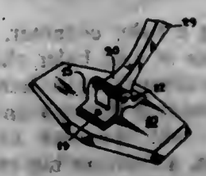
---

2,771,017
IMPLEMENT SUSPENSION FOR AGRICULTURAL MACHINES
Rector C. Ferguson, Gadsden, Ala., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Original application September 10, 1949, Serial No. 114,969. Divided and this application March 4, 1954, Serial No. 414,015
2 Claims. (Cl. 97—47.64)

1. A suspension system for agricultural implements comprising, in combination, a mobile support, an implement unit, means connecting said implement unit in guided vertically movable relation to said support, said means including a link member pivotally connected at one end with said implement unit, pivot means connecting said link at its other end with said support for swinging movement relative thereto about a fixed pivot center, an actuating rocker member pivotally mounted on said support on an axis in spaced relation to said fixed pivot center, a cam element rigidly connected with one of said members, a cam follower element connected with the other of said members and engageable with said cam element, and a counterbalancing spring operatively interposed between said actuating rocker and said support so as to bias said link for swinging movement about said fixed pivot center in implement raising direction.

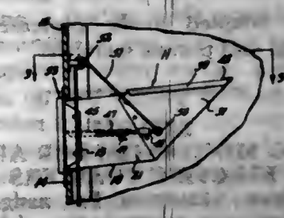
---



2,771,018
SPRING MOUNTED TOOL SHANK
Karl Martin Zahn, Stockton, Calif., assignor to International Harvester Company, a corporation of New Jersey
Application August 17, 1953, Serial No. 374,611
2 Claims. (Cl. 97—47.24)

1. In an agricultural implement including a transverse frame and an earth working tool having a lower earth penetrating portion and an upper shank portion, means for mounting the tool on the frame comprising a channel member removably secured to the upper end of the shank including depending flanges straddling the shank and extending beyond the upper end thereof to resist lateral movement of the shank relative thereto and provided with transversely aligned apertures, a pivot pin received in said apertures, a bracket affixed to the frame including spaced lugs adapted to straddle said channel and pivotally mounted on said pin, a second pivot pin mounted in said channel spaced from the first mentioned pin longitudinally of the shank, a spring pressure device connecting said second pin to the frame, said spring pressure device comprising a rod pivotally connected at one end to the second pin and said frame having an opening to slidably receive the rod, and a spring surrounding the rod and operatively engageable with the frame to yieldably resist pivoting of the channel and tool relative to the frame.

---



2,771,019
WEEDING HOE
Frederick H. Zeitz, Lubbock, Tex., assignor of one-half to John D. Smith, Jr., Lubbock, Tex.
Application November 22, 1954, Serial No. 470,179
2 Claims. (Cl. 97—68)

2. A weeding hoe comprising a relatively flat elongated blade tapering from its center toward its ends, a clevis having a webbed portion mounted on said blade adjacent the central portion thereof with the web of the clevis being relatively thin but of sufficient strength to rigidify the blade, said clevis having a longitudinal slot through its central portion providing a passageway for dirt, said clevis including a pair of upstanding arms providing a handle-receiving recess therebetween with the handle-receiving recess communicating with said slot to provide for the disposal of dirt accumulating therein, a handle having a head for snug reception within said handle receiving recess, means to pivot said head to the arms of said clevis for limited oscillating movement whereby the angle between said blade and said handle may be changed in accordance with the direction of force applied by said handle on said blade, cooperating stop means on said clevis and said head to limit the extent of oscillation of the blade with respect to said head, said stop means being in close juxtaposition to said slot whereby dirt cannot accumulate to interfere with the movement between said handle and said blade.

---

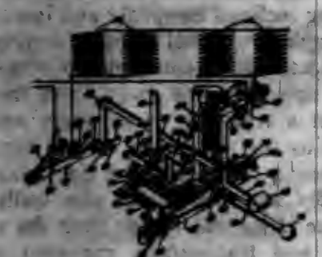
2,771,020
VENTILATOR
Peter T. Shanahan, Jamaica, N. Y.
Application December 6, 1955, Serial No. 551,381
1 Claim. (Cl. 98—37)

In a building, a ventilator comprising a frame mounted in a vertical wall of the building, a duct rigidly secured at one end in said frame and extending into the building, said duct being inclined upwardly and inwardly at a relatively small angle, a channel member secured to the inner end of said duct, said channel member having a bottom wall inclined upwardly and away from the bottom wall of the duct at a relatively large angle and having side walls secured to the side walls of the duct, defining an upwardly opening outlet for the duct, horizontal shaft means rotatably mounted in the side walls of the duct, a damper plate elongated longer than the vertical height of said duct and transversely mounted on said shaft means, a lever member having one end fixedly secured to said shaft means externally of the duct in substantially the same plane as said damper plate, a counterweight adjustably mounted on said lever member, a stop member mounted on the side wall of the duct subjacent said lever member between the counterweight and said shaft means, limiting downward movement of the lever member to substantially a horizontal position thereof, a control cable secured to the free end of said lever member, and pulley means on the building wall above said frame, said cable passing over said pulley means, whereby said damper plate may be rotated to a substantially vertical position by exerting downward force on the control cable.

---

2,771,021
DOOR WITH BUILT-IN DEODORIZER
James L. Buckley, Scarsdale, N. Y., assignor to Georgia-Pacific Plywood Company, Olympia, Wash., a corporation of Georgia
Application October 16, 1953, Serial No. 386,538
5 Claims. (Cl. 98—87)

4. A door unit having means for use in modifying odors between an area having unpleasant odors and another area, comprising a panel member having a substantially imperforate surface adapted to be presented toward said another area, a foraminous member supported in close spaced relation with said panel member and on the side thereof away from said imperforate surface and adapted to be presented toward said first mentioned area, means including a porous member for modifying the odor of said first mentioned area in the space between said panel member and said foraminous member, and means adjacent to said panel member and having



channels formed therein, said channels establishing communication between the atmosphere on the side of said

panel member adapted to be presented toward said another area and said porous member.

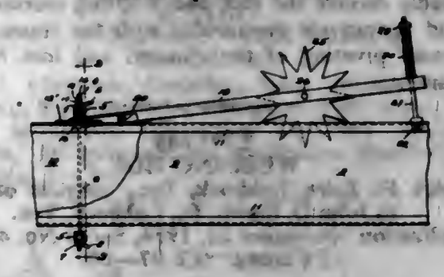
2,771,022
**OPERATING MECHANISM FOR AUTOMATIC ELECTRIC TOASTERS**
Edwin S. Hollister, Allentown, Pa., assignor to General Electric Company, a corporation of New York
Application October 5, 1951, Serial No. 249,962
13 Claims. (Cl. 99—329)

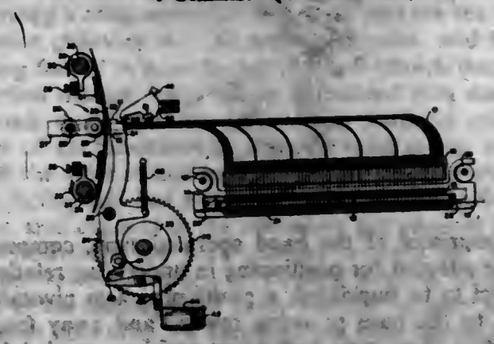
3. In an automatic electric toaster having electric heating units, a carriage, means biasing the carriage to non-toasting position, means for moving the carriage from non-toasting to toasting position against the action of said biasing means and means for holding the carriage in toasting position, timing means for releasing said holding means to permit the carriage to return to non-toasting position comprising a bimetallic element, means supporting the bimetallic element at one end about which it turns, the other end being free, a support for such free end, the bimetallic element being so arranged that when heated its free end tends to flex toward the support whereby the bimetallic element tends to bow in a direction away from such support, holding means positioned adjacent the central portion of said bimetallic element and operatively connected to said moving means which after the bimetallic element has bowed a certain amount engages it to hold it against return movement whereby upon cooling its free end flexes in a direction away from its support, heating means for the bimetallic element, a switch which closes a circuit through said heating means, means operated by the bowing of said bimetallic element to effect opening of said switch and the movement of said bimetallic element holding means into engagement with the bimetallic element, means actuated by the free end of said bimetallic element when it flexes away from its support for actuating said carriage holding means to permit movement of the carriage from toasting to non-toasting position, and means actuated by movement of the carriage from toasting to non-toasting position for moving said bimetallic element holding means from engagement with the bimetallic element.



2,771,023
**APPARATUS FOR STERILIZATION OF CANNED FOODS**
Thomas J. Kearney, Detroit, Mich., assignor to Detrex Corporation, Detroit, Mich., a corporation of Michigan
Application July 25, 1950, Serial No. 175,728
11 Claims. (Cl. 99—330)

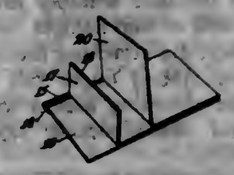
1. In apparatus for sterilizing food in sealed containers with heated heavier than air mixed chlorinated hydrocarbon vapors; an enclosed elongated chamber having an upwardly extending throat at the top at one end, at least one well in the bottom of the chamber for receiving a mixture of said chlorinated hydrocarbons, means for feeding the hydrocarbons to the well and means for heating and vaporizing the hydrocarbons, condensing means extending around the inner periphery of the throat wall between the top and bottom thereof, a similarly arranged trough for hydrocarbon condensate below the condenser and arranged to catch the condensate from the condenser and throat wall, means for supplying cooling fluid to the condenser, a water separator; means for conducting the condensate from the trough to the separator, a distributing sump and means for conducting the hydrocarbon liquid from the separator to the sump and from the sump to the well; an endless food conveyor passing downwardly through the throat opening, travelling back and forth through the chamber in a circuitous path and emerging through the throat opening, means for operating the conveyor, and conveyor carried means for transporting sealed food containers through the chamber.

---



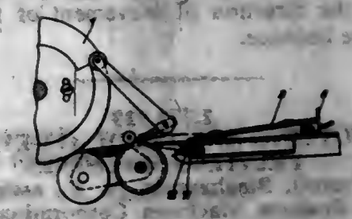
2,771,024
**TENSIONING ADJUSTING DEVICE FOR THE BALING CHAMBERS OF BALING PRESSES**
Walter Maxwell, Marshfield, Wis., assignor of one-half to Glenn W. Maxwell, Marshfield, Wis.
Application April 15, 1954, Serial No. 423,337
1 Claim. (Cl. 100—43)

A baler comprising a baler chamber, movable tension rails forming the sides of said baler chamber, a tension rail adjusting device comprising a horizontal adjusting bar, a pivot bolt extending through an end of said adjusting bar whereby said bar may have both pivotal and sliding movement, a fulcrum lug extending laterally from said adjusting bar adjacent to the pivoted end thereof, said fulcrum lug having pressure engagement with the tension rail at one side of the baler chamber, a yieldable member connecting the other end of the adjusting bar to said baler and a star wheel mounted on said adjusting bar, extending into the baling chamber adapted to contact material moving through the baling chamber effecting lateral movement of the adjusting bar and tension rail, increasing or decreasing the baling area of said baling chamber.



2,771,025
**PRINT IMPRESSION MECHANISM**
Harold J. Kleiner and Otto F. Menneggie, Endicott, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application November 2, 1953, Serial No. 389,621
4 Claims. (Cl. 101—93)

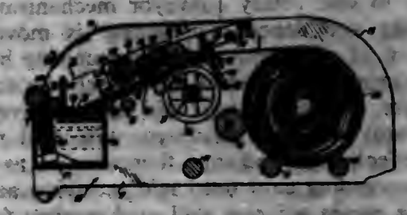
1. A print impression mechanism of the class described in a cyclically operable printer for printing characters on a record sheet comprising a movable printer head having a cluster of loosely held print elements arranged so that the ends thereof define a character pattern at a printing face, a movable platen, means for moving said printer head towards and away from said platen once each printer cycle at a rate of speed insufficient to provide value of printing stroke energy which is sufficient to effect good quality printing, and means for simultaneously therewith moving said platen towards and away from said printer head a plurality of times each printer cycle at a rate of speed insufficient to provide a value of printing stroke energy which is sufficient to effect good quality printing, said moving means effectively moving said printer head and said platen simultaneously into a common printing zone once each printer cycle to cause said loosely held print elements and said platen to simultaneously engage the record sheet positioned in the printing zone between the printing face of said printer head and said platen, whereby the ends of said loosely held print elements are aligned by the impact of the aforesaid engagement in a common printing plane at a value of printing stroke energy which is sufficient to effect a good quality print impression of said character pattern on the record sheet.



---

2,771,026
**STENCIL ASSEMBLY**
Lawrence R. Mooney, St. Paul, Minn.
Application February 6, 1950, Serial No. 142,565
3 Claims. (Cl. 101—128.2)

1. A stencil assembly comprising a relatively narrow securing strip having a non-drying pressure sensitive adhesive coating of a type to permit the same to be removably adhered to another sheet, a stencil sheet affixed along one marginal edge portion to only a portion of said adhesively coated strip, a separate carbon sheet affixed along one marginal edge portion to only a part of the remaining exposed adhesive coating on the bottom side of said strip to leave a portion of the underlying coating exposed for removable attachment to a selected part of a larger sheet whereby cutting of the stencil will produce a similar carbon impression on said larger sheet and thereafter said stencil may be removed to be further used in a duplicating operation.



2,771,027
**SHEET FEEDING AND BUCKLING DEVICE FOR ROTARY DUPLICATORS**
Wilhelm Ritzerfeld, Berlin-Dahlem, and Gerhard Ritzerfeld, Berlin-Grunewald, Germany
Application January 21, 1953, Serial No. 332,431
3 Claims. (Cl. 101—132)

1. For use with a printing machine, a sheet feeding arrangement, comprising, in combination, supporting means; transporting roller means located adjacent said supporting means; a feeding table mounted on said supporting means movable in one direction toward and away from said transporting roller means; a plurality of first abutment means on said feeding table spaced from each other in a direction transverse to said one direction, each of said first abutment means extending in said one direction and adapted to engage the lateral edge of one sheet of a pile of sheets which partly overlap each other in said transverse direction; an adjustable stop means on said supporting means engaging and blocking said feeding table spaced a predetermined distance from said transporting roller means in a position in which said transporting roller means are adapted to engage and stop one transverse edge of each of said sheets so as to form a bulge in said sheets; and second abutment means secured to said feeding table projecting from the same, extending transverse to said one direction and adapted to engage the other transverse edges of said sheets so as to prevent sliding of said sheets in said one direction off said feeding table and to provide endwise pressure on said sheets during formation of the bulge.

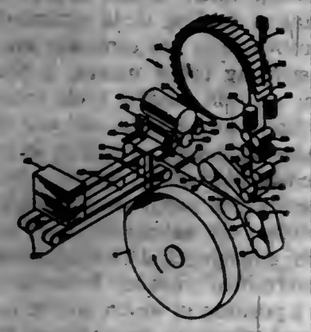
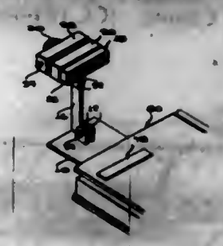
2,771,028
**TAPE DISPENSING AND PRINTING DEVICE**
Charles P. Taylor, Belleville, Ill., assignor to Ideal Stencil Machine Company, Belleville, Ill., a corporation of Illinois
Application September 29, 1952, Serial No. 312,057
13 Claims. (Cl. 101—227)



1. In a tape dispensing and printing device, a frame having formed therein a holder for a supply roll of the tape, feed rolls between which the tape is movable, a tape chute beyond the feed rolls in the direction of movement of the tape toward a dispensing region, the tape chute including a channel member and a weight-plate lying adjacent to the channel member in spaced relation, the plate extending rearwardly of at least one of the feed rolls and having an aperture through which said one feed roll may extend to engage the tape, the weight plate being provided with a second aperture, a printing device carried entirely by and above the weight plate and including a type-bearing roll adapted to extend through the second said aperture of the weight plate into engagement with the tape as same passes through the tape chute, the printing device including an inking

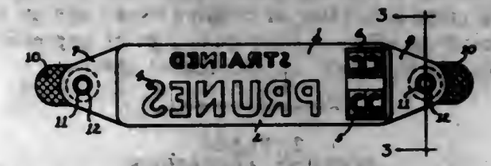
element normally engaging the type-bearing roll, and spring means operatively connecting said type roll and said inking element so as to urge said type roll and said inking element into mutual engagement, and to bias the type roll depthwise of said second aperture, means for actuating at least one of the feed rolls, and a tape severance knife located beyond the weight plate and printing device, in the direction of movement of the tape to a zone of tape issuance.



---

2,771,629
**WEB CUTTING AND FEEDING DEVICE FOR PRINTING MACHINES**
Fred M. Carroll, Binghamton, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application April 30, 1952, Serial No. 285,134
3 Claims. (Cl. 101—227)

1. In a machine for forming record cards from a web having means for printing successive impressions on one face of the web, and means for cutting the web into separate cards, each bearing a single impression; the combination of a card receiver having a receiving bed and a pivotally mounted card stripping and depressing element arranged to be oscillatable over said receiving bed; a continuously operating rotary conveying mechanism for gripping one edge of a card after being cut and, during turning, correspondingly turning the card into position for reception by said receiver, said receiving bed thereof arranged in the plane of rotation of said conveyor mechanism so that each card gripped thereby is moved directly into said card receiver; means for oscillating said card stripping and depressing element in a timed relationship to said rotary conveyor mechanism so that said stripping and depressing element is moved away from and out of alignment with said receiving bed to be ineffective during the period of movement of a card from said conveyor mechanism into said card receiver and is moved towards and into alignment with said receiving bed to be effective immediately thereafter so as to position each succeeding card onto said receiving bed; a rotary printing means adjacent said card receiver for printing impressions on the reverse face of each succeeding card; card feeding means including reciprocable card pushers for acting upon the trailing edge of a card in said card receiver so as to advance the card from said card receiver to said rotary printing means; means for rendering said card feeding means operative in a timed relationship to said rotary conveyor mechanism so that a card is pushed from said card receiver during the period that said stripping and depressing element is effective to position the card onto said receiving bed; means for normally maintaining said pushers above the surface of said receiving bed; and means for moving said pushers below the surface of said receiving bed during the period said card stripping and depressing element is ineffective to position a card on the card receiving bed, to thereby permit a next following card to be moved from said rotary conveyor mechanism onto said receiving bed.



2,771,630
**DEVICE FOR PRINTING AND CUTTING CHARACTERS**
David B. Jones, Athens, Ohio
Application October 17, 1952, Serial No. 315,364
7 Claims. (Cl. 101—298)

1. An imprinter of the hand operated type, comprising: a base adapted for positioning in underlying relation to an object to be imprinted; a positioning arm pivotally connected to the base to swing toward and away from said object; a type case containing openings carried by said arm to swing therewith against said object, said type case providing cutting means defining the outline of a character to be formed; a series of type cores secured together for simultaneous movement relative to said case, having reduced ends received in said openings, slidably carried within the case and having imprinting faces adapted to be projected beyond said case and forced into said object on swinging movement of the case thereagainst; deformable resilient material supporting said cores in retracted positions relative to said case; and means interengaging between the case and said cores to hold the same assembled with one another; said cutting means and cores being adapted to engage said object in sequence.

---

2,771,631
**SNAP-ON RADIAL MOUNTED PRINTED DIE**
Rudolph W. Knapp, Chicago, Ill., assignor to The Premier Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application February 25, 1953, Serial No. 338,803
3 Claims. (Cl. 101—415.1)

1. A flexible printing die comprising a flexible inelastic rubber base, a flexible stiffener member secured to said rubber base, printing characters on said rubber base above said flexible inelastic stiffener member, an elastic ear on at least one end of said flexible rubber base beyond said stiffener member, die attaching means carried by said ear, and a separate ribbed finger tab attached to said ear beyond said die attaching means to stretch said ear for connecting and disconnecting said die attaching means.

---

2,771,632
**MATERIAL BREAKING SAFETY CARTRIDGE**
Oscar L. Callahan, West Frankfort, Ill., assignor to Cardox Corporation, Chicago, Ill., a corporation of Illinois
Application February 23, 1951, Serial No. 212,364
10 Claims. (Cl. 102—25)

1. In combination, a material breaking cartridge having a body formed of a chambered section, for receiving a compressed gas charge, and a discharge section connected end-to-end, means forming a valve seat between said body sections, said discharge section having lateral gas charge release ports and a control chamber, a main valve cooperating with said valve seat for controlling the release of the gas charge from the receiving section chamber to the release ports, means in the discharge section for forming a compressed gas flow path between the receiving section chamber and the control chamber, said flow path being forked to provide two separate branch ducts in one portion thereof, valve means associated with one of said branch ducts and adjusted to only partially restrict the flow of gas therethrough, separate valve means associated with the other of said branch ducts for opening and closing the latter, said last mentioned valve means having a surface area exposed to the maximum gas pressure to which said cartridge has been charged to hold the last mentioned valve means in a fully closed position during charging of the cartridge and being movable to open said other branch duct after the cartridge has been charged and the restricted flow of gas through said one branch duct has increased the pressure of the gas in said control chamber to one predetermined value relative to said maximum pressure, and differential pressure operated means, subjected to said maximum pressure and to the control chamber pressure, for moving the main valve off of its seat when the gas pressure built up in the control chamber reaches a second and higher predetermined value relative to said maximum gas pressure.

---

**ERRATUM**

For Class 102—34 see:
Patent No. 2,771,212

---

2,771,633
**VENTLESS DELAY ELECTRIC INITIATORS**
Idwal O. Lewis, Ardrowman, and Robert D. J. Owens, Saltcoats, Scotland, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain
Application August 22, 1952, Serial No. 305,906
Claims priority, application Great Britain November 22, 1951
3 Claims. (Cl. 102—28)

1. A ventless short delay electric detonator comprising an electrically actuated igniting charge, an initiating charge and an interposed short delay element enclosed in a ventless container essentially of copper wherein the said short delay element comprises a cut-off length of fuse comprising a flexible textile envelope around a core comprising a dry crumbly graphite-glazed nitrocellulose bonded granular mixture of silicon and red lead, said red lead being in amount of from about 65% to 95% by weight, the silicon in amount of from about 5% to 35% by weight, and the nitrocellulose in amount up to about 5% by weight of the red lead and silicon.

---

2,771,634
**BLASTING CAP**
Thomas Gaynor Blake, Webster Groves, Mo., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application December 29, 1951, Serial No. 264,099
1 Claim. (Cl. 102—28)

An electric blasting cap having an ignition composition comprising lead ethylenediaminenitrate, a lead azide initiator charge, and a base charge selected from the group of

explosives consisting of cyclotrimethylenetrinitramine, trinitrotoluene, ethylenedinitramine, picric acid and tetryl.

---

2,771,635
**PROPELLANT**
John D. Clark, Webster Groves, Mo., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
No Drawing. Application March 5, 1953, Serial No. 340,663
6 Claims. (Cl. 102—98)

6. A nitrocellulose base propellent powder grain having up to as much as about 5 percent potassium nitrate in discrete, particulate crystals of less than 30 microns along their major axis and bound to the surface of the propellent grain.

---

2,771,636
**ROTARY PUMPS AND THE LIKE**
Guillermo Federico Benz, Buenos Aires, Argentina
Application January 19, 1955, Serial No. 482,815
4 Claims. (Cl. 103—90)

1. A device for lifting or compressing fluids, which comprises a casing having an inlet opening and an outlet opening; a first rotor mounted within said casing and provided with a plurality of blades adapted to move the fluid from said inlet opening towards said outlet opening; a second rotor mounted within said casing between said first rotor and said outlet opening, and provided with a plurality of blades extending in a direction opposite to that of the blades of the first rotor; a motor; and a mechanism for transmitting motion from said motor to said rotors in order to drive said first rotor in such a direction that the fluid is moved from said inlet towards said outlet and to drive said second rotor at the same speed as said first rotor but in an opposite direction, the pitch of the blades of said second rotor at the end adjacent the first rotor corresponding to the equation

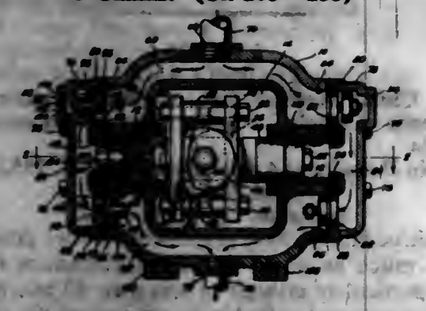
$$a_2 = \frac{V_{a_2}}{n'_2 + n'_3}$$

wherein
$a_2$ is the pitch of said blades;
$V_{a_2}$ is the axial velocity at the outlet end of said second rotor;
$n_3$ is the tangential velocity of the counter-rotation; and
$n'_2$ is $\sqrt{V_{a_2}^2 - V_{a_2}^2}$

wherein

$Ve_1$ is the velocity of the admission of fluid at the inlet end of the first rotor; and

$Ve_2$ is the velocity of the fluid at the discharge end of said first rotor.



---

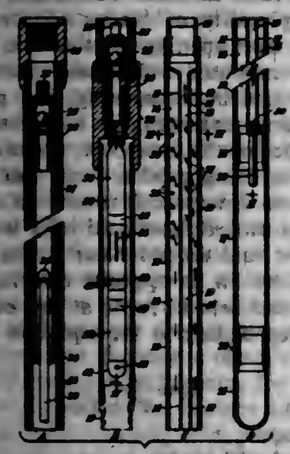
2,771,037

## TWIN CYLINDER SPRAY PUMP

Douglas Johnston, Huntsville, Ala., assignor to John Blue Company, Incorporated, Huntsville, Ala., a corporation of Alabama

Application June 11, 1952, Serial No. 292,914
3 Claims. (Cl. 103—153)

3. In a pump the combination comprising: a cylinder block forming an open-ended cylinder for reciprocation of a piston therein, said block having suction and discharge passageways therein each having a terminal end opening to the exterior of said block adjacent an open end of said cylinder; a cylinder head detachably connected to said block and covering said cylinder open end and said passageway ends, said head having a chamber therein provided with ports aligned with said cylinder open end and said passageway ends; means defining an annular recess between said block and head at each of said passageway ends; inlet and outlet check valves at said suction and discharge passageway terminal ends, respectively, each of said valves having a circumferential flange of smaller diameter than the corresponding recess, disposed therein, and clamped between said head and said block; and an O-ring packing disposed between the periphery of each of said flanges and the outer wall of their corresponding recesses.



---

2,771,038

## OIL AND WATER WELL PUMPING PLANT

Aladalr Seaton Cameron, Guayaquil, Ecuador

Application June 1, 1954, Serial No. 433,726
4 Claims. (Cl. 103—203)

1. In pumping apparatus for oil and water wells comprising a tubing string and a pump having a barrel fitted to the lower end of the tubing string and including at its lower end a standing valve, which is withdrawable upwardly from said barrel and tubing string, the combination of a gas and sand trap constituted by a long tube closed at its lower end, attached at its upper end to the pump barrel and divided by longitudinal partitions into three segmental compartments, namely a central compartment open at the top and closed at the bottom and two outer compartments closed at their upper ends and communicating at their lower ends, one of said outer compartments being of larger cross sectional area than the other outer compartment and having one or more large inlets near its upper end through which liquid can flow downwardly through said larger outer compartment and thence upwardly, through said smaller outer compartment and the central compartment having, near its upper end, one or more inlets through which liquid can flow into the central compartment from said smaller outer compartment, and a tubular flow control device disposed within said long tube above the upper open end of said central compartment, said flow control device being closed at its lower end, having an open upper end attached to the standing valve so that it may be withdrawn upwardly from the tubing string with said standing valve and having in its wall at least one adjustable slot for controlling the flow of liquid from said central compartment to said pump.

---

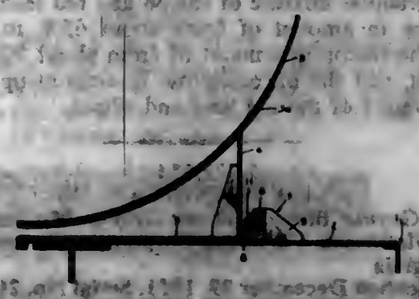
2,771,039

## SAFETY SUPPORT FOR TRUCK-MOUNTED ARTICLES

Albert G. Dean, Narberth, Pa., assignor to The Budd Company, Philadelphia, Pa., a corporation of Pennsylvania

Application July 1, 1954, Serial No. 440,795
2 Claims. (Cl. 105—217)

1. A safety support for a power device on a car truck, comprising in combination, a wheeled truck turnably connected to a car body, a power device mounted on the truck and having a drive connection with the car wheels; a transverse support bar secured beneath the car body, a member slidable on said support when the truck turns, and flexible and normally slack supporting means connected to said member and said power device to provide a safety support if the power device should break away from its support on the truck.



---

2,771,040

## TANK ANCHOR MEANS FOR TANK CARS

Clyde H. Folmsbee, Charlevoix, Mich., assignor to Union Tank Car Company, Chicago, Ill., a corporation of New Jersey

Application July 16, 1953, Serial No. 368,279
3 Claims. (Cl. 105—362)

3. In a tank car incorporating an underframe and a longitudinally arranged tank, the improvement which comprises: a cradle secured to the tank and adapted to seat on the underframe; a plurality of anchor means secured to the underframe alongside the cradle on each side thereof; each of said anchor means including a longitudinally extending key overlying a portion of the cradle; the cradle, anchor means and keys having opposed surfaces adapted to block the cradle and tank against lateral and vertical movement only, whereby the tank is free to expand longitudinally.

---

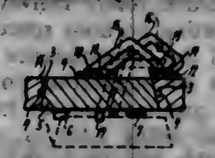
2,771,041

## PANEL STRUCTURE, PARTICULARLY LETTER-BOARD FOR RAILWAY CARS

Reinhard Fuchs, Philadelphia, and Edward J. Hochreiter, Cynwyd, Pa., assignors to The Budd Company, Philadelphia, Pa., a corporation of Pennsylvania

Application December 28, 1950, Serial No. 203,132
1 Claim. (Cl. 105—401)

In a railway car, a wall structure comprising spaced frame members, said members having a first wall extending in the general direction of said structure and an adjoining second wall extending transversely thereto, said first wall being outwardly crowned to a shallow depth over part of its length and over part of its width to the exclusion of a narrow strip along the meeting edge between said two walls, and an outwardly smooth panel secured to said members throughout said crowned parts thereof.



---

2,771,042

## VAULT DOORS FOR BANKS AND BUSINESS INSTITUTIONS

Charles U. Deaton, Crestwood, Mo., assignor to Diebold, Incorporated, Canton, Ohio, a corporation of Ohio

Application March 19, 1953, Serial No. 343,368
8 Claims. (Cl. 109—64)

1. A safety and protective doorway for vaults, safes, and the like comprising a wall having exterior and interior faces and a door-opening therein, the front and rear peripheral margins of the door-opening lying in parallel planes, a substantially flat door sized and shaped for snug-fitting closure-forming engagement within the door-opening, said door having an interior and an exterior face, a link pivotally secured at one end to the interior face of the door and pivotally secured at its other end to the interior face of the wall whereby the door can be swung into and out of closure-forming position, said link integrally comprising a long leg and a short leg transversely connected in spaced parallel relationship by an intermediate member, said link being so shaped as to fit conformably around the edges of the doorway when the door is open, another link also shaped so as to fit conformably around the edges of the doorway when the door is open and being pivotally connected at its ends respectively to the interior faces of the door and wall at points which are laterally spaced in relation to the hinge points of the first-named link to hold the door substantially parallel to its initial position throughout its arc of swing, one of said links being provided with a projecting tooth, a shaft rotatably mounted in the door and projecting at its rear end from the interior face of the door adjacent to said projecting tooth, and means rigidly mounted on the projecting end of the shaft for optionally engaging the tooth as the door approaches closed position whereby to draw the door tightly into such closed position.

---

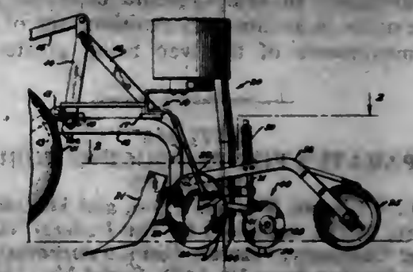
2,771,043

## TRACTOR PARALLEL ROW PRODUCING GUIDE MEANS

Clarence J. Carlson, Marshalltown, Iowa

Application July 2, 1952, Serial No. 296,880
2 Claims. (Cl. 111—1)

1. In combination with a tractor, an implement attachment including a main frame extended transversely of the tractor and pivotally supported on the front end of the tractor for swinging movement in a plane substantially parallel to the ground travelled by the tractor, a first indicator member fixed on said frame and having a rearwardly extended portion arranged normal to the frame, a second indicator member pivotally mounted on said frame for horizontal swinging movement about a vertical axis, said second indicator member including a first portion extended transversely of the frame and arranged in a plane substantially parallel thereto and a second portion for engaging the ground to maintain said second indicator member parallel to the path of travel of the tractor, and means for moving said frame relative to said tractor to maintain said rearwardly extended portion and said transverse portion in vertical alignment.



---

2,771,044

## UNIFORM SEED COVERER ATTACHMENT FOR LISTERS

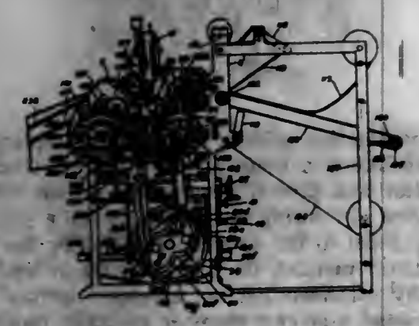
Robert E. Puttfer, Burrton, Kans.

Application June 9, 1953, Serial No. 360,487
5 Claims. (Cl. 111—85)

3. In a lister planter comprising furrow opening means for forming a furrow and seed depositing means for dropping seeds into said furrow, uniform seed covering means for covering seeds deposited along the bottom of a furrow formed in uneven ground, comprising a U-shaped frame pivotally mounted adjacent its ends to said lister planter for movement about a horizontal axis transverse to said furrow, said frame extending rearwardly from said ends, a depth gauge depending from the rear portion of said frame, said depth gauge having a foot adapted to ride on the bottom of said furrow behind said seed depositing means with its bottom surface a fixed

distance below said frame, and a pair of seed covering tools one on each side of and approximately abreast said depth gauge, said tools depending from the rear portion of said frame, the bottom of each of said tools being at a fixed distance above said foot of said depth gauge, whereby when said lister planter is operated over uneven ground each said seed covering tool will be maintained respectively at the same height relative to the adjacent bottom of said furrow and said seeds will be covered to a substantially uniform depth independently of vertical movements of said furrow opening means.

---



2,771,045

## METHOD AND APPARATUS FOR SEWING MULTI LAYERS OF MATERIAL

James A. Cash, Jr., Louisville, Ky., assignor to American Mattress Machine Co., Louisville, Ky., a corporation of Kentucky

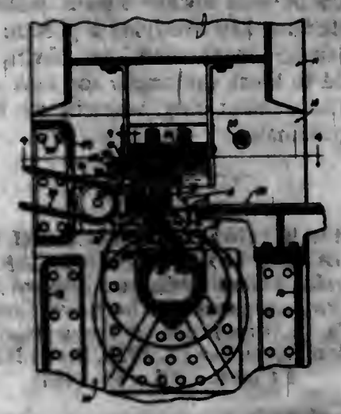
Application March 9, 1953, Serial No. 341,199

42 Claims. (Cl. 112—2)

1. The method of stitching a web of material which comprises: sewing said web with a needle moving transversely while moving said web longitudinally with a generally rectilinear movement in one direction to produce a line of stitches extending generally transversely of the web from one longitudinal edge to the other; moving said web longitudinally in the opposite direction while said needle remains in a stationary position to produce a line of stitches extending generally longitudinally of the web; then moving said web longitudinally in said one direction while moving said needle transversely to produce a line of stitches extending generally diagonally of the web and intersecting the first line of stitches; then moving said web longitudinally with a generally rectilinear movement in said opposite direction while said needle remains in a stationary position; one of said longitudinal movements of the web being greater than the other.

---

2,771,046



## APPARATUS FOR PRODUCING TUBULAR MEMBERS

Arthur L. Williams, Warren, Ohio, and Donald F. Brace, Berkley, Mich., assignors to The Federal Machine and Welder Company, Warren, Ohio, a corporation of Ohio

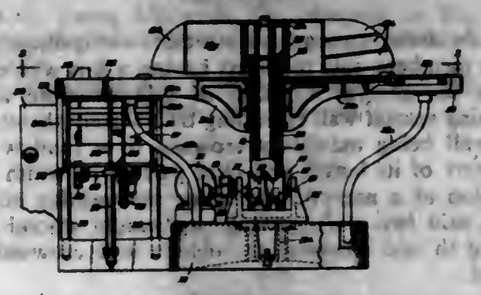
Application June 29, 1951, Serial No. 234,238

1 Claim. (Cl. 113—11)

In apparatus for forming sheet stock, the combination comprising a pair of rolls forming a pass for said stock and rotatable to drive said stock through said pass, deflector means engageable with said stock to bend the latter as it leaves said pass, a pin transversely carried by one of said rolls and yieldably urged to project beyond the periphery thereof, said pin being held inwardly of the periphery of said one roll by engagement with the stock moving through said pass and said pin projecting outwardly of the periphery of said one roll when clear of said stock to engage the trailing edge of said stock and move such trailing edge away from said rolls, and means to prevent interference between said pin and the other roll of said pair of rolls and comprising a circumferential

groove formed in the periphery of said other roll in axial alignment with said pin.

---



2,771,047

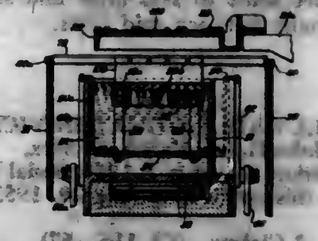
## AUTOMATIC SOLDERING MECHANISM

Jack J. Zimmerman, Riverside, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Application August 11, 1954, Serial No. 449,119

9 Claims. (Cl. 113—59)

1. A machine for applying solder to parts of the surfaces of successive ones of printed circuit panels adapted to be movably carried in the machine from one work station to another with each panel comprising a thin insulated member with a circuit pattern of thin metal conductors on a side thereof, said machine including a container for molten solder, rotary conveyor means having a plurality of supporting portions spaced at equal angular distances around the circumference and adjacent the outside thereof with the supporting portions adapted to be stopped at work positions for the machine, said supporting portions each being adapted to have a printed circuit panel removably positioned thereon for assembly of electrical components thereon and for soldering of the components thereto, means to rotate said conveyor means intermittently to position successive ones of said supporting portions and the panels carried thereon horizontally over said container, solder-carrying means positioned within said container and movable vertically to carry solder into soldering contact with a panel supported thereover, elevator means supporting said solder-carrying means for movement from a lower position below the level of the solder in said container to an upper position adjacent to the underside of the panel, said solder-carrying means having a plurality of rims defining a selected solder surface configuration such that the solder contacts only selected portions of the panel, and means to move said elevator means progressively upward to position said solder-carrying means adjacent the underside of a printed circuit panel positioned thereover with the solder in contact with the metal conductors thereon while maintaining a convex upwardly extending solder surface on said solder-carrying means.



2,771,048

## AUTOMATIC SOLDERING MACHINE

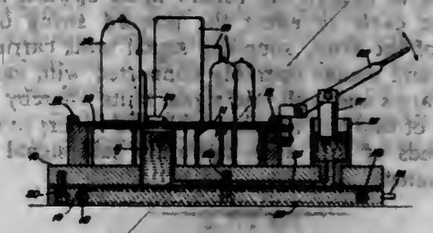
Jack J. Zimmerman, Riverside, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Application February 1, 1955, Serial No. 485,561

13 Claims. (Cl. 113—59)

1. In a machine for applying solder to selected areas on the underside of a printed circuit panel comprising a thin insulated panel having a circuit pattern of thin metal conductors on a side thereof and having selected parts which must not be contacted with solder, and which includes a container for molten solder, conveyor means having a panel supporting portion and movable to hold a printed circuit panel horizontally in a selected position over the molten solder container; a solder-carrying tray positioned in said container, means to move said solder-carrying tray upwardly in said molten solder container from below the surface of a quantity of molten solder therein to a position adjacent the underside of the printed circuit panel to carry a quantity of molten solder for selective soldering of the underside of the printed circuit panel, said solder-carrying tray being of a size and shape operable to carry solder for contacting substantially the entire underside of the panel, and said solder-carrying tray having an aperture therein with an upstanding rim extending around the periphery thereof, said aperture and rim being adapted to be aligned with a selected part of a panel positioned thereover which must not be contacted with solder and thereby providing a selected surface configuration for solder in said tray for contact with selected areas on the underside of the panel.

---



2,771,049

## SOLDERING DEVICE

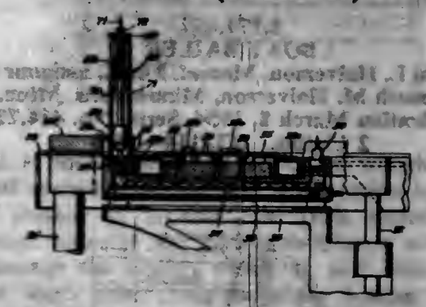
James L. Fish, Chicago, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Application March 1, 1955, Serial No. 491,489

4 Claims. (Cl. 113—59)

1. A device for selective application of solder to a plurality of prelocated localized areas on a printed circuit panel assembly, including in combination, a base structure, a plurality of open-ended tubes extending upwardly from said base structure, means for supporting a panel assembly in a fixed position over the tops of said tubes, a well for molten solder positioned on said base structure and extending upwardly therefrom, a channel extending through said base structure to interconnect said well and said tubes, a solder displacing member positioned for movement in said well for displacing molten solder upwardly in said tubes into soldering contact with selected areas of the panel assembly supported thereover, and said tubes being of sufficient diameter and being capable of holding a quantity of molten solder therein operable to transfer sufficient heat to the selected areas on the panel assembly to maintain said areas above the minimum temperature required for soldering and thereby being the only source of heat required for soldering.

---



2,771,050

## AUTOMATIC SOLDERING MACHINE

Jack J. Zimmerman, Riverside, Ill., assignor to Motorola, Inc., Chicago, Ill., a corporation of Illinois

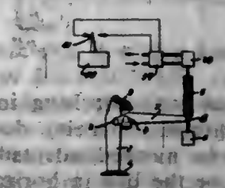
Application March 8, 1955, Serial No. 492,949

9 Claims. (Cl. 113—59)

1. A machine for applying solder to parts of the surface of a printed circuit panel which comprises a thin insulated panel with a circuit pattern of thin metal conductors on a side thereof, said machine including an enclosed container for molten solder having a plurality of open-ended tubes extending upwardly therefrom and terminating in a common horizontal plane, conveyor means having supporting portions for each of a plurality of insulated panels and movable intermittently to position successive ones of said supporting portions and the panels carried thereon horizontally over said container, said container being supported for reciprocal motion between a lower position and an upper position adjacent the underside of a panel positioned thereover, means to move said container and tubes to said upper position with the upper end of said tubes positioned adjacent the underside of a printed circuit panel positioned thereover, and means for displacing molten solder in said container when said container is in said upper position to cause solder to rise in said tubes to contact selected points on the panel positioned thereover.

---

2,771,051



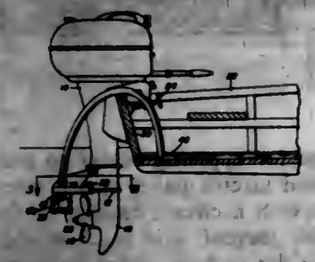
## AUTOMATIC SEA-DAMPING GEAR FOR HYDROFOIL BEARING WATERCRAFT

Hanns von Schertel, Wiesbaden, Germany, assignor to Supramar A. G., Zug, Switzerland

Application October 7, 1952, Serial No. 313,405

Claims priority, application Switzerland October 23, 1951

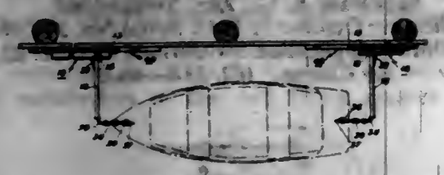
20 Claims. (Cl. 114—66.5)



1. A hydrofoil arrangement for watercraft having a hull comprising, in combination, a double armed supporting lever mounted on said watercraft for turning movement about a horizontal axis; a supporting means turnably mounted on one arm of said supporting lever and being movable in vertical direction with the same; a hydrofoil means supported on said supporting means downwardly spaced from the hull, said supporting means and said hydrofoil means being movable between a normal position and a plurality of displaced positions; a control link member turnably mountable at one end thereof on said watercraft and pivotally connected at the other end thereof to said supporting means at a point spaced from said arm of said supporting lever, said control link member and

said arm of said supporting lever being inclined with respect to each other so that said control lever member turns said hydrofoil means into an angularly displaced position in which the angle of attack of the same is changed in such sense as to compensate the change of lifting forces acting on the hydrofoil means during passage through a wave when said hydrofoil means is moved by a wave out of said normal position into a displaced position.

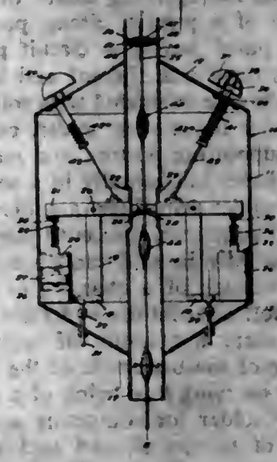
---



2,771,052
BOAT BAILER
Merlin L. Halverson, Mound, Minn., assignor to Kenneth M. Halverson, Minneapolis, Minn.
Application March 8, 1954, Serial No. 414,728
2 Claims. (Cl. 114—185)

1. In combination with a boat and outboard motor therefor, said motor being provided with a propeller and a cavitation plate, a bilge water bailer of said boat comprising a bracket receivable on the cavitation plate, a tubular venturi projecting below said plate and positioned rearwardly of said propeller, and a flexible tube having one end secured to and in communication with the venturi and the other end terminating in the bilge of the boat for providing passage of the bilge water, said bracket formed integrally with the venturi and providing passage between the tube and venturi and including an elongated slot for receiving the cavitation plate, one side of the slot being provided with screw threaded openings, and clamp screws in said opening for selectively clamping said bracket to the cavitation plate.

---

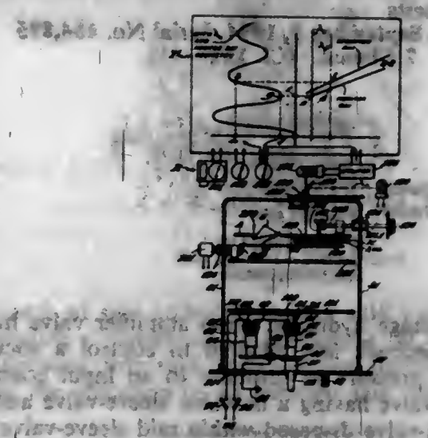


2,771,053
BOAT MOORING MEANS
Eric W. Gustafson, Salem Springs, Wis.
Application April 1, 1953, Serial No. 346,221
6 Claims. (Cl. 114—230)

1. Boat mooring apparatus comprising, in combination, a pair of oppositely disposed mooring devices, one for each end of a boat to be moored, adapted to be affixed to the side of a dock or the like in horizontally spaced relation, each said mooring device including a housing-link mounting member, an elongated, horizontally disposed mooring arm normally housed in said member, and vertical pivot means operatively connecting said arm near one end thereof to said mounting member and for swinging movement in a fixed horizontal plane outwardly from and thence inwardly toward the side of the dock, said pivot means connecting the adjacent ends of the mooring arms to their respective mounting members whereby said arms are swingable outwardly towards one another and being horizontally spaced a distance at least as great as the length of said boat to be moored, means for limiting the outward swinging movement of the mooring arms to approximately 90° whereby said arms may be swung outwardly from the dock only to a position in which they extend substantially normal thereto, and extensible connector means carried by and extending from the free ends of the mooring arms adapted upon the arms being swung outwardly as aforesaid to be separably connected to the ends of said boat to be moved, thereby to secure same to said arms and so that it extends longitudinally between said arms.

---

2,771,054
WELL CABLE SIGNAL DEVICE
John Goins, Hobbs, N. Mex.
Original application February 7, 1950, Serial No. 142,819. Divided and this application July 29, 1953, Serial No. 370,957
2 Claims. (Cl. 116—67)

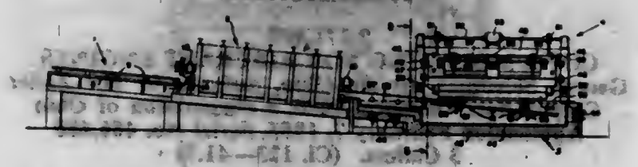


1. The combination with a well drill cable, of a cylindrical housing, a pipe extending axially through the housing for connection with the top end of a well casing and the passage of the cable therethrough, said pipe having opposite vertically slotted openings intermediate the ends of the portion thereof enclosed by the casing, posts rising vertically within the lower portion of said casing, a pair of radially disposed rocker arms pivotally mounted on the upper end of said posts with the opposed inner ends of said arms extending into said pipe through said openings, means for yieldably retaining said arms in a substantially horizontal position, a roller carried on each of the opposed inner ends of said arms for engaging said cable passing therebetween, a trip member carried by the cable to engage the rollers upon upward movement of the cable to effect the upward swing of the inner ends of the arms, sounding signal units carried by said casing and means operably connected with each of said rocker arms and with said signal units whereby upon engagement of said trip member with said rollers to swing the inner ends of said arms upwardly said signal units will be actuated.

---

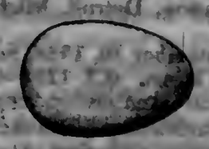
2,771,055
APPARATUS FOR COATING OPTICAL INTERFERENCE LAYERS
Donald H. Kelly and Frank C. Rock, Jr., Los Angeles, Calif., assignors to Technicolor Corporation, Hollywood, Calif., a corporation of Maine
Application April 25, 1952, Serial No. 284,410
11 Claims. (Cl. 118—9)

3. Apparatus for the controlled evaporation coating of superimposed layers of a plurality of optical media, comprising: two containers for the respective media; means for selectively heating one of said media in said containers; means for supporting above said containers a specimen to be coated; means for rotatably supporting a monitor plate at approximately the distance of a specimen surface from the heated medium; an attenuating mask having an aperture rotatably arranged between said containers and said supporting means; means for rotating said mask to control layer deposit thickness distribution; aperture means between said mask and said monitor plate for exposing only a portion of the plate; and



means for rotating said monitor plate supporting means so as to permit exposure of different portions thereof through said aperture means to said heated materials.

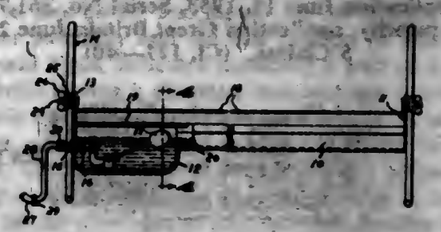
---



2,771,056
APPARATUS FOR COATING PIPES
Frederic O. Hess, Philadelphia, Pa., assignor to Seiss Corporation of America, Philadelphia, Pa., a corporation of Pennsylvania
Application June 6, 1951, Serial No. 230,166
5 Claims. (Cl. 118—64)

1. Apparatus for galvanizing pipes comprising in combination a furnace having a substantially cylindrical closed chamber therein, means to heat said chamber located around the exterior thereof, means forming an entrance at one end of said chamber and an exit, displaced circumferentially from said entrance, at the opposite end of said chamber, rotary conveying means in said chamber to move pipe circumferentially from said entrance to said exit whereby the pipe can be heated as it is moving, a galvanizing tank located axially beyond the exit of said chamber, a tunnel extending between said exit and said tank below the level of zinc therein, and means to move pipe axially into said chamber and axially from said chamber through said tunnel into said tank.

---



2,771,057
ARTIFICIAL NEST EGGS
Clayton E. Quinn, Roebuck, S. C.
Application November 14, 1955, Serial No. 546,721
4 Claims. (Cl. 119—45)

2. An artificial nest egg to be pecked by a fowl whereby small particles of the same enter the mouth of the fowl, said nest egg being about as hard as chalk, said nest egg comprising a mass including plaster of Paris forming the major portion of said mass and relatively small amounts of mustard oil, capsicum, pine oil, pine rosin and aminonitrothiazole, all ingredients being thoroughly mixed.

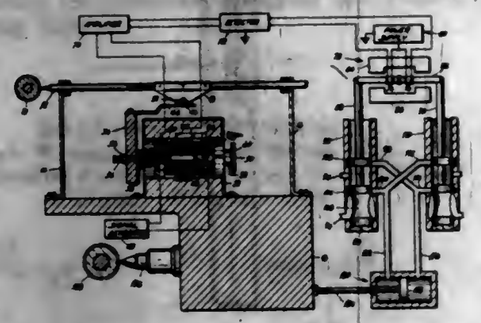
---

2,771,058
POULTRY WATERING DEVICE
Clayton W. Howard, Thomaston, Maine
Application March 20, 1952, Serial No. 277,625
3 Claims. (Cl. 119—78)

1. In a poultry watering device, a trough including first and second portions, said first portion being of V-shaped section to provide that grain introduced into the trough water by the poultry is linearly concentrated to encourage the poultry to eat it, said second section being a water inlet chamber whose bottom is located below the bottom of said first section, a barrier in said first section adjacent said second section to retain entrant grain in said first section, and a cover for said second section including a portion overlying said barrier.

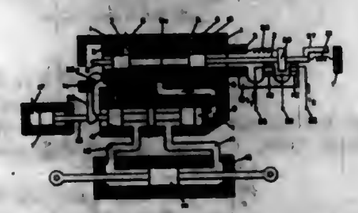
---

2,771,059
NON-FLOODING FOUNTAIN PEN
Benjamin F. Miesmer, Morristown, N. J.
Application April 6, 1954, Serial No. 421,300
7 Claims. (Cl. 120—48)



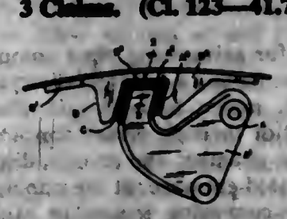
4. A fountain pen having a hood with a plurality of bores therein of different lengths and arranged in tandem alignment in order of the diameter of the bores with the widest bore outermost, a pen point having a shank located in a bore in the hood next to the widest bore, a tube having a pointed opening positioned close to the pen nibs and extending through a bore in the hood of larger diameter than itself to a point near the inner extremity of the hood where it fits tightly into the hood, said tube having a plurality of transverse holes closely adjacent and before the point where it enters a tight fitting bore in the hood, the length and diameter of all of these bores with respect to the diameter of the parts fitting in them being proportioned so capillarity and gravity acting on the ink will balance each other to give the maximum writing efficiency, a two part air and ink tube extending from a point closely adjacent the pen nibs to a point near the inner free end of the reservoir, said two parts being joined at the inner end of the hood by a flexible hollow coupling, and means carried by the hood for acting on the coupling to close it as and for the purpose described.

2,771,860
LOCKING MECHANISM FOR FLUID PRESSURE OPERATED DEVICES
Dennis Howard Allbright, Foleshill, Coventry, England, assignor to Dunlop Rubber Company Limited, London County, England, a British company
Application June 15, 1953, Serial No. 361,750
Claims priority, application Great Britain June 27, 1952
5 Claims. (Cl. 121—40)



1. A locking mechanism for two members movable relative to each other which comprises one member having an annular recess coaxial with the line of movement of said members, and a second member having a circular flange coaxial with the line of movement of said members, separate, individual, locking elements arranged at intervals about the line of movement of said elements, each having a rocking engagement in said recess and having a lipped catch to engage the flange of said second member and having a shoulder and a tail portion, and a sliding member spring pressed in one direction to about said shoulder and movable in the opposite direction to engage said tail portion and to rock said locking element to disengage said lipped catch from said second element.

2,771,861
LATCHING MECHANISM FOR POSITIONING APPARATUS
John R. Farron, Oak Park, Mich., assignor to Bendix Aviation Corporation, Detroit, Mich., a corporation of Delaware
Application September 14, 1953, Serial No. 379,926
8 Claims. (Cl. 121—41)

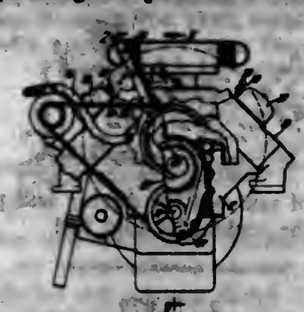


1. In combination, input means, a motion sensor including first and second members movable relative to each other from a null position to generate a signal, means on the first member of the motion sensor to prevent a relative displacement between the first and second members of more than a predetermined magnitude within the signal generating limits of the sensor, means for providing a cooperative coupling between the input means and the first member of the motion sensor for movement of the first member in accordance with the movements of the input means, output means connected to the second member of the motion sensor for movement of the second member in accordance with the signal generated by the motion sensor, means operative upon the predetermined relative displacement between the first and second members of the motion sensor to actuate the coupling means for a free movement of the input means relative to the first member, and means operative upon actuation of the coupling means to position the first member to one side of its null position relative to the second member to produce a signal in the sensor for moving the output means in the direction of disposition of the first member.

2,771,862
TWO-STAGE DIFFERENTIAL SERVO VALVE
Paul F. Haynes, Nashua, N. H., assignor to Sanders Associates, Incorporated, Nashua, N. H., a corporation of Massachusetts
Application September 9, 1954, Serial No. 454,895
7 Claims. (Cl. 121—41)

1. In a two-stage hydraulic servo amplifier valve having internal feedback and adapted to control a source of fluid under pressure in response to an input control signal, a pilot valve having a movable sleeve-valve and a movable piston-valve disposed within said sleeve-valve; a control valve having a second movable piston-valve; fluid passageways coupling said pilot-valve and control-valve whereby displacement of said first piston-valve effects displacement of said second piston-valve; means coupling said second piston-valve and said sleeve-valve for displacing said sleeve-valve in response to displacements of said second piston-valve for discontinuing the motion of said second piston-valve; and motor means connected to and carried by said sleeve-valve and said first piston-valve, for movement therewith, for effecting relative displacement therebetween.

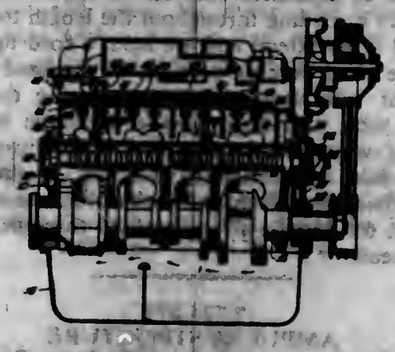
2,771,863
COWL MOUNTING FOR AIRCRAFT ENGINES
George Skidmore, Bryan, Ohio, assignor to The Zeller Corporation, Defiance, Ohio, a corporation of Ohio
Application February 7, 1955, Serial No. 486,480
3 Claims. (Cl. 123—41.7)



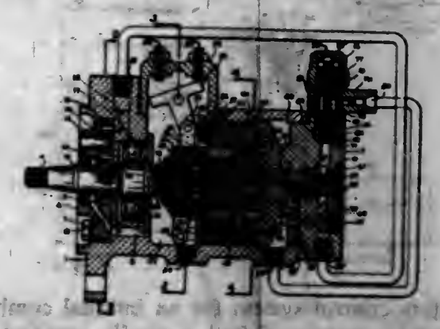
1. In a cowl mounting for radial type multi-cylinder engines including socket members and lug members for engaging the same with clearance therebetween, each lug member being recessed on opposite sides thereof, a resilient cushion cap for said lug formed of rubber like material externally fitting said socket and attachably and detachably engaging said lug being provided with inwardly projecting portions adapted to be sprung into engagement with the recesses of said lug to retain its attachment thereto.

2,771,864
CRANKCASE VENTILATION
Gilbert Burrell, Lansing, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application September 30, 1954, Serial No. 459,392
14 Claims. (Cl. 123—41.86)

1. In an internal combustion engine having spaced rocker arm compartments, a crankcase ventilating system adapted to prevent the entry of crankcase fumes into said rocker arm compartments and to permit the entry of air directly into said compartments and thence to other parts of the crankcase of said engine with which said compartments communicate, said system comprising means associated with each of said rocker arm compartments for collecting and filtering air including the air driven by the engine fan and carrying said air into each



of said rocker arm compartments of said engine, said collecting means being formed and positioned to include means for equalizing the quantities of clean air received



by each of said collecting means, said ventilating system including a non-breathing lubricating oil filler tube communicating with said crankcase and having a cap to prevent the induction of air through said filler tube.

2,771,865
CRANKCASE VENTILATING MEANS
Robert H. Malcolm, Fort Wayne, Ind., assignor to International Harvester Company, a corporation of New Jersey
Application September 18, 1953, Serial No. 381,012
2 Claims. (Cl. 123—41.86)

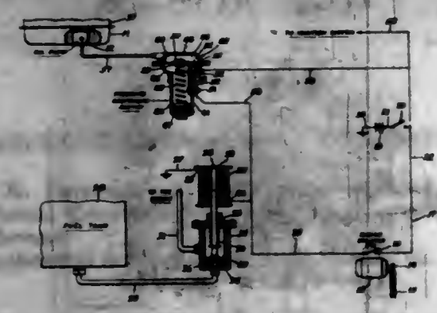
1. In a ventilating system for V-type internal combustion engines or the like comprising a substantially hollow block structure having a pair of upwardly diverging cylinder banks and a rectangularly shaped, downwardly facing opening, said upwardly diverging cylinder banks forming a substantially V-shaped pocket having an upwardly facing opening, an oil pan secured to said block structure over said downwardly facing opening, a longitudinally extending wall defining the juncture of said banks and the bottom of said pocket, said wall further separating said pocket from a crankcase chamber partially defined by said oil pan and a portion of said block structure, one end of said wall being provided with an opening therethrough for establishing communication between said crankcase chamber and the interior of said pocket; a cover assembly mounted on said block structure over said upwardly facing opening, said cover assembly including a cover having its marginal edges engaging said block structure and a central longitudinal section bulged upwardly, an end portion of said section having a semi-cylindrical depression formed therein, and a substantially horizontal plate secured to the underside of said cover whereby said plate and cover form a longitudinally extending passage, said cover having a pair of longitudinally spaced openings therethrough, one of said openings being located in said depression and being of a larger diameter than the other opening, said plate having a pair of openings therein in alignment with the openings in said cover; means for establishing communication between the opposite end of said passage and the end of said pocket opposite said opening in said longitudinally extending wall; means for introducing air under pressure greater than atmospheric pressure at the end of said crankcase chamber opposite said opening in said longitudinally extending wall; a tubular exhaust pipe having a closed end portion adapted to seat in said depression, said end portion having a pair of diametrically disposed apertures therethrough, one of said apertures being enlarged and being registrable with the enlarged opening in said cover; and means for detachably securing said cover assembly and the end portion of said exhaust tube to said block structure including a pair of bolts, one of said bolts having a diameter substantially equal to and extendable through a pair of aligned openings in said cover and plate respectively into engagement with said block structure, the other of said bolts having a diameter substantially equal to the other of said openings in said plate and one of the apertures in said tube but smaller than the enlarged opening and aperture in said cover and tube respectively, said last mentioned bolt being extendable through said tube apertures, enlarged cover opening and the plate opening in alignment therewith into engagement with said block structure.

2,771,866
FUEL INJECTION PUMP
Waldemar O. Bischoff, South Hadley Falls, Mass., assignor to American Bosch Arma Corporation, a corporation of New York
Application January 30, 1953, Serial No. 334,330
4 Claims. (Cl. 123—139)

1. In a device of the character described, a positive pressure supply pump, an injection pump, said supply pump being driven in direct ratio to the speed of said injection pump, a fuel path between said supply pump and said injection pump, an automatic variable pressure regulating valve in the fuel path between the supply pump and injection pump, a plurality of outlets and means for distributing fuel pumped by said injection pump to said outlets in desired sequence, means for controlling the quantity of fuel delivered by said injection pump, said means comprising a fuel bypass passage communicating with said fuel distributing means, a fuel control valve for controlling the quantity of fuel bypassed through said bypass passage, a linkage connected to said fuel control valve, a hydraulically actuated governor lever connected to said linkage for actuating said linkage according to the pressure regulated by said pressure regulating valve and resilient means opposing said actuating of said linkage by said hydraulic means.

2,771,867
ENGINE STARTING MECHANISM
Romeo M. Nardone, Teaneck, N. J., assignor to Joseph J. Maranch, Maplewood, N. J.
Application April 1, 1952, Serial No. 279,886
8 Claims. (Cl. 123—179)

1. In an engine starting mechanism, an engine-engaging element constantly in driving connection with a engine part, a turbine rotor in axial alignment with said engine-engaging element, means drivably connecting said rotor and element, said connecting means including a carrier, fixed to the said element a planetary gear train comprising planet gears rotatably mounted upon the carrier and driven



by the rotor and an orbital gear surrounding said planet gears, said orbital gear being normally free to rotate with said planet gears about the common axis of rotation of

said turbine rotor and engine-engaging element, and means responsive to admission of pressure fluid into said mechanism to both energize said rotor and simultaneously lock said orbital gear against rotation.

---

2,771,068
STARTER-CONTROLLED FUEL SUPPLY FOR INTERNAL COMBUSTION ENGINE
Paul F. Jettinghoff, Grosse Pointe Woods, Mich., assignor to International Harvester Company, a corporation of New Jersey
Application March 27, 1953, Serial No. 345,114
4 Claims. (Cl. 123—179)

1. A safety control system for an internal combustion engine having a source of fuel normally supplied under pressure, a fuel supply conduit and an engine-operated pressure lubricating oil system; a valve in said conduit for controlling the supply of fuel to said engine, said valve being biased to its closed condition; a solenoid cooperable with said valve, said solenoid being effective when energized to open said valve against the force of said bias; a source of electrical energy; an electrical circuit interconnecting said solenoid and said source of electrical energy; an engine starter switch in said circuit; an ignition switch in said circuit in series with said starter switch, said circuit being completed to energize said solenoid when said switches are in their closed conditions; a pressure responsive switch operatively connected to said pressure lubricating oil system and being actuatable to its closed condition upon the attainment of a predetermined fluid pressure in said engine-operated pressure lubricating oil system; a conductor leading from one side of said pressure responsive switch to said solenoid; and a second conductor leading from the other side of said pressure responsive switch to said electrical circuit at a point between said starter switch and said ignition switch.

---

2,771,069
ROCKING BED STRUCTURE AND SYNCHRONIZED RESPIRATOR
Charlotte M. Baron, Toledo, Ohio
Application November 7, 1951, Serial No. 255,219
3 Claims. (Cl. 128—29)

2. The combination with a rockable bed for a patient to be treated, a respiratory gas supply, motor means connected to the bed for rocking said bed, a breathing mask for the patient, a gas connection between said mask and said supply, a reciprocating pump in said connection, and means connecting said pump to said bed and operated

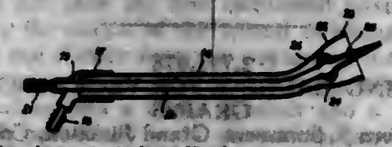
by the rocking of said bed for driving said pump in synchronism with the rocking of said bed.

---

2,771,070
FOUNTAIN SYRINGE AND SWAB
Earl M. Saxon, Oklahoma City, Okla., assignor to Earl M. Saxon, Jr., Wichita, Kans.
Application April 20, 1955, Serial No. 502,614
4 Claims. (Cl. 128—231)

1. A combined syringe and swab comprising an outer tube, an inner tube slidably mounted within the outer tube extending beyond the ends of the outer tube, a head constructed of absorbent material having a central longitudinal bore extending throughout the length thereof, into which said tubes extend and are held, a cord tightly fitted around the head, forcing portions of the head into close engagement with the outer tube, securing the head to the outer tube, said head having discharge bores communicating with said longitudinal bore through which cleansing fluid is directed to the wall of the canal in which the head is inserted, and a bulb on one end of said inner tube, for forcing cleansing fluid through said inner tube and head.

---



2,771,071
AMPULLA STRUCTURE
Gerhard Mann, Berlin-Charlottenburg, Germany
Application September 8, 1954, Serial No. 454,681
Claims priority, application Germany September 12, 1953
1 Claim. (Cl. 128—232)

A disposable plastic ampulla construction comprising a hollow front member having a substantially cylindrical outer surface terminating in an upwardly and outwardly flaring end portion, said end portion being provided with a cylindrical contact face and with an annular welt located rearwardly of and upwardly beyond said cylindrical contact face, a cylindrical and elongated rear member terminating in an end portion having an upwardly and outwardly directed flange terminating in a free outermost end edge extending beyond said end portion of said front member and projecting with said free end toward said rear member, said end portion of said rear member including a recess and a cylindrical contact face forwardly of said recess in tight fitting engagement with said welt and said cylindrical contact face of said front member respectively, the front face of said flange being substantially aligned with the corresponding outer surface of said flaring end portion of said front member to thereby form a shield-shaped prolongation of the latter for protecting the fingers of an operator when squeezing said cylindrical rear member in cross-wise direction of its longitudinal axis to discharge the contents therefrom through an opening in said front member.

2,771,072
MEDICAL APPARATUS FOR INJECTION, INSUFFLATION, AND THE LIKE
Jacques Antoine de Montangé, Paris, France
Application December 24, 1952, Serial No. 327,733
Claims priority, application France December 26, 1951
1 Claim. (Cl. 128—241)

An injection and insufflation cannula comprising in combination, an outer tube of a transparent material having a deflected end portion flared in the form of a cup element conforming with the shape of the uterine cervix, an inner tube of a transparent material extending through said outer tube coaxially therewith and formed with a thickened portion within the cup element and a taper projecting beyond said element, said thickened portion of the tube being welded to the wall of the cup element adjacent the inner end of said element, a sealed end piece secured to the opposite end of the outer tube and providing with an angularly extending connector communicating with said tube, an axial boss on said end piece, having a hole adapted to receive the opposite end of the inner tube, a connector on said boss communicating with the tube, and means for sealing said tubes in said end piece, the outer tube being adapted for connection with a suction line, and the inner tube adapted for connection with an injection line.

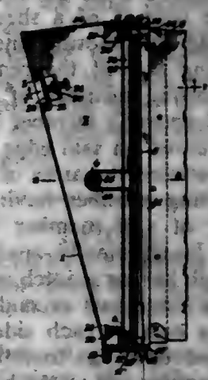
---

2,771,073
ADAPTOR FOR HANDLING A NURSING NIPPLE
Jim Wharton Mills, Bellflower, Calif., assignor to Glendon Homer Jailes, Bellflower, Calif.
Application December 20, 1952, Serial No. 327,066
2 Claims. (Cl. 128—252)

2. A device applicable to the neck of a thermally insulated bottle including, an elongate vertically disposed tubular plug insertable into the neck of the bottle and having a passageway extending longitudinally through it, sealing means carried by the plug adapted to seal between the plug and the neck, a nipple having a mounting flange overlying and engageable with the upper end of the plug, and depending into said passageway, a retainer releasably holding the nipple on the plug, the plug having a channel extending around its lower end portion and said sealing means including a ring of rubber-like material carried in the channel and projecting from the exterior of the plug to be engageable with a neck, the fastener including a collar threaded onto the plug at the upper end thereof and a lip carried by the collar and overlying the flange, and an inverted cup-shaped disc closure releasably carried by the fastener to overlie the upper end of the device and enclosing the nipple in the passageway.

---

2,771,074
AMPOULE ATTACHMENT
Christian Landsperger and Norman I. Applebaum, Burbank, Calif.
Application July 8, 1955, Serial No. 520,685
2 Claims. (Cl. 128—276)



1. In combination, an ampoule having a reduced top neck and a closure of penetrable material engaged in said top neck, a hypodermic needle having a shank, a hub secured on one end of said shank, and a reduced portion on said hub, said shank being engaged through said closure, an annular cap member having a depending skirt portion, said cap member being centrally secured on said

reduced portion and defining a protective further closure and being sealingly engaged over said first-named closure, and a further cap member removably secured over said hub and sealingly engaging the top surface of said first-named cap member.

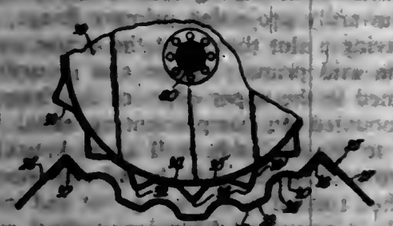
---

2,771,075
BINDER
Walter Easter Haskin, New York, N. Y., assignor to Pressed and Welded Steel Products Company, Inc., Long Island City, N. Y., a corporation of New York
Application November 19, 1954, Serial No. 470,083
5 Claims. (Cl. 129—1)

1. In a book binder the combination of two major elements, the first element comprising a rigid hollow metal backbone formation including a flat back plate formed with perpendicular triangular side walls terminating in hinge knuckles at their free edges, said back plate being formed at one end with an angular end wall extension which together with the said back plate and side walls constitutes a wedge-shaped structure, flanged reinforcing and supporting end brackets positioned inside and attached to the said end and side walls of the back plate, said brackets each having formed on its upper edge a central inwardly projecting primary flange, a secondary flange having a slot therein at the center and positioned below the said primary flange and inwardly projecting ears formed in the upper edges of the flanged ends, side covers mounted on complementary metal hinge leaves attached to the said side wall hinge knuckles by loose hinge pins each having a U shaped extension at one end which when rotated to lie flat against and inside the said side walls is prevented from longitudinal movement by the said ear of an end bracket, and the second major element comprising an inner platform plate positioned inside the backbone member and removably attached thereto, having a notch and a downwardly projecting lip at each end and a folded under flange along each side to form a socket into which the primary flange of the end bracket is projected at each end to secure and prevent accidental removal of the platform plate, the said folded under flanges are seated at each end upon the said secondary

slotted flange with the projecting lip entered in the said slot to prevent lateral movement of the platform plate so that when the two major elements are thus assembled in operative engagement the platform plate bears against and prevents further rotation of the said loose hinge pins extensions and whereby when the two major elements are disassembled the hinge pins and side covers may be removed from the binder for repairs.

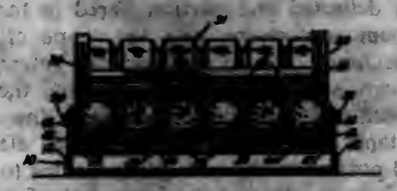
---



**2,771,076**
**RECORD FILING JACKET**
Rudolph A. Peter, Hollywood, Calif.
Application February 15, 1954, Serial No. 410,063
6 Claims. (Cl. 129—16.7)

4. In a phonograph record holding and identifying device: an envelope formed of a sheet material folded to provide sides, said fold closing one edge of the envelope; means closing two of the remaining edges, including a tab supporting member of sheet material at one edge, said tab supporting member being U-shaped in cross section and secured on said edge with a portion of the envelope edge between the arms of the U, the closed edge of the supporting member having notches spaced apart longitudinally of said member thereby providing hinge parts spaced longitudinally apart along said supporting member; a tab having a notch in one edge portion adapted to receive a hinge part of said supporting member, said tab having ears at each side of the notch in said tab with aligned openings therethrough; a pin received in the tab openings and in the hinge part to which the tab is attached; and an enlargement along the free edge of the tab parallel to the tab supporting member.

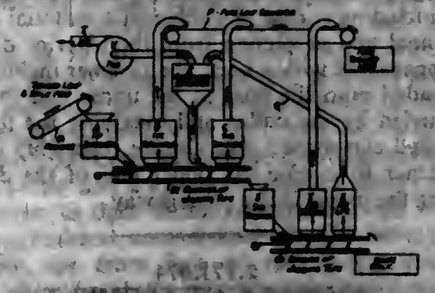
---



**2,771,077**
**SHEET METAL FABRICATED CYLINDER BAR AND CONCAVE**
Elof K. Karlsson and Frank De Ford, Moline, Ill., assignors to International Harvester Company, a corporation of New Jersey
Application August 13, 1953, Serial No. 373,952
2 Claims. (Cl. 130—27)

1. A sheet metal fabricated grain threshing cylinder and concave comprising a sheet metal concave with surface conformations defining transversely disposed raised rib portions and said sheet metal concave having a plurality of apertures therethrough, at least some of said apertures disposed at an acute angle with respect to and located in said raised rib portions, and a sheet metal cylinder including a rib formed thereon and having a plurality of apertures therethrough, said apertures in the cylinder rib disposed at an acute angle with respect to said rib and in a direction opposite to the angular disposition of the apertures in the concave raised rib portions whereby when the rib portions on the concave and the ribs of the cylinder cooperate in opposition to each other grain is effectively threshed therebetween.

---



**2,771,078**
**THRESHING MACHINE FOR VEGETABLES AND GRAINS**
Sebern S. Summers, Grand Junction, Colo.
Application September 9, 1955, Serial No. 533,380
4 Claims. (Cl. 130—30)

1. A threshing machine for beans and like vegetables comprising a frame: a threshing drum rotatably mounted on said frame and including a plurality of side by side, pneumatically tired wheels connected for joint rotation, said wheels each having an outwardly convex peripheral wall, the side walls of the several tires of the wheels being in contact, whereby to define on the drum a side wall having circumferentially extending corrugations from end to end of the drum with each corrugation being defined by the outwardly convex wall of a tire; and a chute including a main trough longitudinally curved over its full length about the axis of rotation of the drum and extending in close proximity to the outwardly convex walls of the tires, said trough being curved only in a longitudinal direction, so as to have a straight cross sectional configuration at all locations along the length thereof, the chute further including a liner soft, resilient material curved longitudinally correspondingly to the trough, said liner being fixedly secured along its opposite side edges to the corresponding sides of the trough, the liner being formed with longitudinally extending corrugations each of which in width is substantially equal to the width of a tire adjacent thereto, the midwidth portion of each corrugation of the liner bearing against the surface of the trough so as to be engaged thereby against movement away from the periphery of the adjacent tire.

---

**2,771,079**
**METHOD AND APPARATUS FOR SEPARATING MATERIALS**
Laurie E. R. Unney, Guildford, Surrey, England, assignor to Vokes Limited, Guildford, England
Application November 12, 1953, Serial No. 391,694
6 Claims. (Cl. 131—146)

1. A comminuting system for vegetable or leafy products, such as tobacco leaf, and for separating the mixture material into a wanted product, such as tobacco particles, and a waste product, such as stalk, comprising a threshing or reduction apparatus for breaking up the material into a mixture of large and small particles, means for feeding said mixture output to at least one separator apparatus, means in said separator apparatus separating said output into a useful product and a residue including a waste product and a potentially useful product, means for feeding the residue to a second threshing apparatus for breaking up said residue into a mixture of particles smaller in size than the first mentioned mixture, means for feeding the output of the second threshing apparatus to at least one further separator apparatus, means in said second separator apparatus for separating said last mentioned mixture into a useful product and a residue including still potentially useful particles or product, means for collecting the useful product from each of said separator apparatus, and means for recirculating the potentially useful product from one separator apparatus to the inlet side of the threshing apparatus from which it is fed.

**2,771,080**
**ASH TRAY**
Edmund J. Cole, Meade, Pa.
Application August 27, 1952, Serial No. 306,545
1 Claim. (Cl. 131—240)

An ash tray formed from a substantially circular block of non-inflammable material and comprising a substantially circular ash receiving compartment located at substantially the center of the block, a plurality of angularly spaced apart wells arranged in a generally hexagonal configuration around said compartment and spaced outwardly therefrom, and wall portions separating adjacent wells from one another and from said compartment, each of said wall portions having in its upper surface a groove for receiving and supporting a cigarette, the opposite ends of each groove opening into adjacent wells, and radially extending grooves located at the juncture between each wall portion and the adjacent wall portion for receiving a cigarette and each having its opposite ends opening into said compartment and one of said wells respectively.

**2,771,081**
**HAIR BANG MOLD**
Maxine R. Shirmeyer and Madonna R. Adams, Fort Wayne, Ind.
Application May 31, 1955, Serial No. 511,883
1 Claim. (Cl. 132—53)

A hair bang mold of the character described comprising: a substantially U-shaped, resilient member adapted to be mounted circumferentially on the forehead beneath the hair to be molded, said member including a female section comprising integral, inturned guide flanges on its longitudinal edges and having longitudinally spaced openings in its inner end portion, said member further including a male section telescopically adjustable in said female section and having its longitudinal edges slidably engaged in the guide flanges, said male section having an aperture in its inner end portion for registry with the openings, a resilient latch on said inner end portion of the male section engageable selectively in the openings through the aperture for positively securing said male section in adjusted position, and means for securing the member in position on the forehead.

---

**2,771,082**
**FINGER NAIL PAINT GUARD**
Miriam J. Sawyer, Los Angeles, Calif.
Application November 6, 1953, Serial No. 390,448
1 Claim. (Cl. 132—73)

In a finger tip guard for use in painting the finger nails, a flat circular base, a cylindrical spacer member of a compressible material centered on the base, a circular disk of a flexible material centered on said spacer member and having a series of substantially arcuate recesses formed in equidistantly spaced relation along the edge thereof to be engaged by the tips of the fingers with the edge portions of the nails bearing on the edge portions of the recesses and means securing said base, the spacer member and the disk together, the downward pressure of the edges of the nails on the edge portions of the recesses causing the latter to pull the flesh away from the edges of the nails to prevent any smearing of the flesh with the paint.

**2,771,083**
**RETRACTABLE MIRROR DEVICE**
Samuel Darvie, New York, N. Y., assignor to Elegante Accessories, Inc., New York, N. Y., a corporation of New York
Application July 19, 1955, Serial No. 522,904
8 Claims. (Cl. 132—79)

1. In a combination retractable mirror and lipstick holder, a mirror movable between projected and retracted limiting positions, a housing therefor, spring means normally urging said mirror into its said projected limiting position, an open portion at the rear of said housing, a spring catch disposed in said open portion and having a forwardly extending lip proportioned to extend into said housing and a rearwardly extending portion protruding rearwardly from said housing, a lipstick holder behind said housing and movable along a path intercepting said rearwardly extending portion, said holder being slidably engageable with said rearwardly extending portion to yieldably urge said catch forwardly to a predetermined locking position, a container attached to the rear of said housing and slidably accommodating therein thereof an aperture in substantial registry with said open said holder, said container having in the forward portion portion of said housing, a lug at the rear of said mirror

and positioned in the path of said lip when said catch is in said locking position, said lip being positioned above said lug when the mirror is in its said retracted position, said spring catch being yieldably held in a rearwardly retracted position when operatively out of engagement with said actuating member, said lip being out of the path of said lug and said rearwardly extending portion of the catch protruding rearwardly through said aperture in said container when the catch is in its said retracted position.

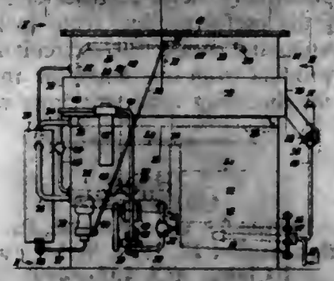
---

**2,771,084**
**DENTAL CLEANER**
Margaret E. Fleming, Niagara Falls, N. Y., assignor to John S. Fleming, Niagara Falls, N. Y.
Application September 29, 1953, Serial No. 382,987
6 Claims. (Cl. 132—89)

1. A self-cushioned dental cleaner, consisting of a narrow ribbon of flexible paper having longitudinal edges, one of said longitudinal edges being a soft self-cushioned edge resulting from tearing said ribbon from and along a weakened tear line of a sheet of said paper, said soft edge being beveled upon one side thereof and of approximately the same breadth throughout its length, said ribbon being movable between adjacent teeth with its soft edge pressed vertically against the gums, said soft edge having a brushing action during such movement.

---

**2,771,085**
**DENTAL CLEANER**
Margaret E. Fleming, Niagara Falls, N. Y., assignor to John S. Fleming, Niagara Falls, N. Y.
Application September 25, 1953, Serial No. 382,366
7 Claims. (Cl. 132—89)



1. A self-cushioned dental cleaner, consisting of a plurality of superposed identical layers of flexible paper, the peripheral portions of said layers comprising a set of superposed tongues, each of said tongues having a soft self-cushioned edge beveled upon one side thereof resulting from tearing the related layer from and along a weakened tear line of a sheet of said paper, and paper fold means for connecting said layers together back of said tongues, said tongues having their adjacent surfaces free of connection with one another, said set of tongues being movable between adjacent teeth with their soft edges pressed against the gums, the soft edges of the plural tongues having collectively a brushing action during such movement.

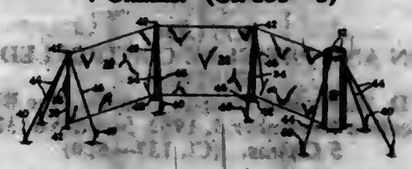
---

**2,771,086**
**APPARATUS FOR TREATMENT WITH SOLVENTS**
Thomas J. Kearney, Detroit, Mich., assignor to Detrex Corporation, Detroit, Mich., a corporation of Michigan
Application October 12, 1954, Serial No. 461,871
3 Claims. (Cl. 134—69)

1. Apparatus for treating a work object with a chlorinated hydrocarbon comprising, a housing, a boiling well mounted within the housing and containing a liquid chlorinated hydrocarbon, heating means arranged to boil said liquid to form a vapor, an ultrasonic well mounted within the housing and containing a liquid chlorinated hydrocarbon, a piezoelectric transducer submerged in the liquid of the ultrasonic well and adapted for emitting ultrasonic energy, said transducer being energized by an electrical circuit independent of said liquid, an overflow dam positioned between said boiling and ultrasonic wells and adapted for allowing said liquid to overflow from said ultrasonic well into said boiling well, cooling means positioned on the housing above said wells for condensing said vapor into a condensate, collecting means mounted beneath said cooling means for catching said condensate,

condensate receiver means connected to said collecting means for storing said condensate, and conduit means connecting said condensate receiver means with said ultrasonic well, whereby a continuous circulating cycle is maintained, said liquid being vaporized in the boiling well, then condensed, collected, stored and returned to the ultrasonic well, then overflowing into the boiling well to again be vaporized, a spray lance having a spray nozzle, and flexible conduit means connecting said condensate receiver means with said spray lance whereby to feed said condensate to said spray nozzle for flushing over the work object and returning said condensate to said wells.

---



**2,771,087**
**PORTABLE SCREEN**
Lyle E. Simonsen, Thermopolis, Wyo.
Application September 28, 1953, Serial No. 382,592
2 Claims. (Cl. 135—4)

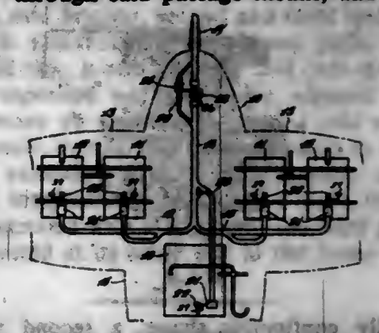
1. A portable shelter comprising a plurality of resilient bows, a ridge piece, said bows being pivotally secured at one end to said ridge piece, a latching block, a plurality of brace members pivotally secured at opposite ends to said latching block and said bows respectively whereby the latching block is movable toward and away from the ridge piece to effect spreading and collapsing the bows respectively, said ridge piece having a bore therethrough, said latching block having a main body portion and an end portion of reduced diameter, said reduced end portion of the latching block being received in said bore with the main body thereof in engagement with said ridge piece, a cylindrical cap secured to said reduced end portion and projecting therefrom through said bore when the shelter is open, said cap having a closed free end and diametrically opposed slots in the longitudinal central portion thereof, a spring received in said cap, said spring having a coiled bight portion nested within the closed end of said cap and a pair of substantially parallel leg members, each provided with an offset projecting through one of said slots to overlie and engage upon the upper end of said ridge piece.

**2,771,088**
**SHIELD**
Lewis E. Soldan, San Diego, Calif.
Application November 7, 1951, Serial No. 255,231
7 Claims. (Cl. 135—5)

1. An extensible and retractible shield that can provide shelter against the elements and that comprise a hollow housing, a relatively impervious wall, said wall being long and wide but being thin and being readily bendable, said housing having a support therein, said wall being bendable to wind around and be held by said support in retracted position within said housing, one end of said wall being secured to said support to be inseparable from said housing, the other end of said wall being extendable from said housing to intercept the elements, a second support for said wall when said wall is in extended position, said second support being securable to and readily separable from said wall, and a plurality of support-engaging elements on said wall to selectively hold or free said second support, the first said support being hollow and having a removable closure for one end thereof, said second support being dimensioned to fit within the first said support.

---

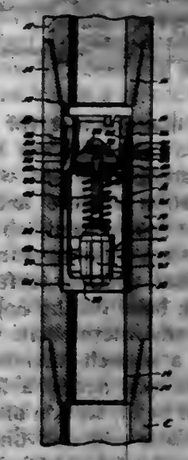
**2,771,089**
**CRUTCH**
Herbert N. Magida, Chicago, Ill.
Application January 14, 1954, Serial No. 404,068
12 Claims. (Cl. 135—59)



1. In combination with a walking crutch frame having a ground-engaging end, auxiliary supporting means having a bottom supporting end, means for pivotally connecting said auxiliary supporting means to said crutch frame at a point spaced a substantial distance from both ends of the crutch frame, locking means for fixing the angle between said crutch frame and said auxiliary supporting means, and means for selectively varying the distance between the bottom end of the auxiliary supporting means and the pivot axis thereof.

---

**2,771,090**
**LIQUID FLOW CONTROL SYSTEMS**
Peter Stevens Macgregor, Upton, Poole, England, and Charles Harry Smith, Duxbury, Conn., assignors to Flight Refuelling Limited, Tarrant Rushton Airfield, near Blandford, England
Application December 28, 1951, Serial No. 263,896
Claims priority, application Great Britain October 12, 1951
12 Claims. (Cl. 137—399)

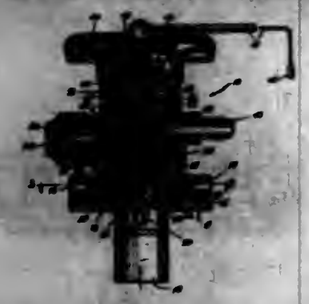


1. A liquid flow control system comprising a tank, liquid passage means in communication with said tank for supplying liquid under pressure to said tank, a shut-off valve in said passage means and operable between open position permitting maximum flow and closed position stopping all flow through said passage means, a flow-control valve in said passage means and operable between open position permitting maximum flow through said passage means and a closed position establishing a reduced flow through said passage means, and means for

opening and closing said valves and including float means in said tank and connected with said shut-off valve for closing such valve when the tank is full and means connecting said float means with said flow-control valve for closing said latter valve as the liquid level rises in the tank and prior to the closing of the shut-off valve to reduce flow through said passage means and prevent liquid hammer when said passage means is closed by said shut-off valve.

---

**2,771,091**
**DRILL PIPE FLOAT VALVE**
Reuben C. Baker, Coalinga, and Thomas M. Ragan, Downey, Calif., assignors to Baker Oil Tools, Inc., Los Angeles, Calif., a corporation of California
Application February 23, 1954, Serial No. 411,991
7 Claims. (Cl. 137—542)



2. In a drill pipe float valve: a valve body having a valve seat and an inner hub below said valve seat; a guide in said hub and having a flange engaging the upper end of said hub; a member threaded on said guide and engaging the lower end of said hub; a valve stem slidable in said guide; valve means on said stem movable upwardly into engagement with said seat; and a spring engaging said flange and said valve means to urge the latter upwardly into engagement with said seat.

---

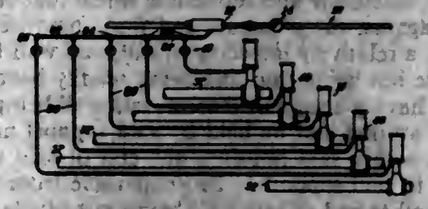
**2,771,092**
**MULTI-OUTLET EXPANSION VALVE**
John A. Schenk, Clayton, Mo., assignor to Alco Valve Company, University City, Mo., a corporation of Missouri
Application January 23, 1953, Serial No. 332,899
4 Claims. (Cl. 137—561)

1. In a multi-outlet valve construction: a body member having an inlet and a plurality of outlets, the outlets

being generally circularly arranged about the inlet but being axially displaced therefrom; a partition wall providing a valve port adjacent the inlet, the valve port being transverse to the axis about which the outlets are disposed, the wall on the outlet side of the valve port diverging from the valve port outwardly and axially around the axis of the outlets to adjacent the outlets in a smooth,

substantially continuous shape; a second wall spaced from the first, extending from adjacent the port to adjacent the outlets, and of a shape corresponding to the first so that the two provide a distribution passage flaring outwardly from the valve port to the outlets; a valve movable toward and from the valve port; and the total area of the outlets being from 1.5 to 4.5 times the effective area of the valve port when fully opened.

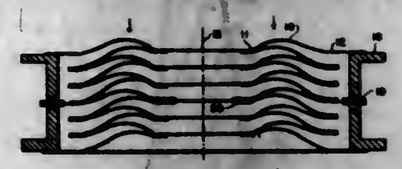
---



**2,771,693**
**BLEEDER VALVE FOR HYDRAULIC BRAKE SYSTEMS**
Harry O. Wilson, Seattle, Wash.
Application December 26, 1952, Serial No. 328,073
1 Claim. (Cl. 137—614.17)

As an article of manufacture for use as a permanent part of a hydraulic brake system having an internally threaded outlet opening provided with an internal seat therein, a combination closure and bleeder valve assembly adapted for permanent, shiftable mounting in said opening, said assembly comprising an elongated body having a frusto-conical, external surface on one end thereof, a horse-receiving head on the opposite end thereof, a set of external threads intermediate the ends thereof adjacent said surface, a wrench-receiving section intermediate said threads and said heads, a longitudinal bore extending through said head, section and threads and terminating in spaced relation to said one end, and a lateral bore extending into the body between said surface and said threads to a point of communication with said longitudinal bore, said longitudinal bore being provided with a set of internal threads within the head and the section, an intermediate seat-presenting shoulder within said external threads and a smooth stretch between said shoulder and said internal threads; a valve element within the longitudinal bore and provided with a conical face adapted for engagement with said shoulder to close said longitudinal bore; a tubular plug having a passage therethrough, said plug being externally threaded and adjustably and removably received with said longitudinal bore by said internal threads of the latter; and a coil spring within said stretch, said spring extending between and being secured to the plug and the element for yieldably biasing the latter into seated engagement on the shoulder, whereby the assembly may be permanently installed in said opening of said system by engagement of said external threads of the body with the internal threads of said opening and may be alternately shifted between a closing position disposing said surface in sealing engagement with said seat and a bleeding position disposing said lateral bore in communication with said opening.

---



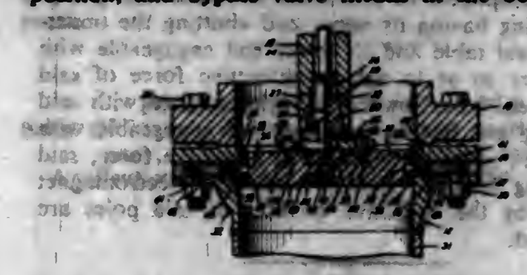
**2,771,694**
**SUCTION AND PRESSURE CONTROLLED VALVE SYSTEM**
William D. Bailey and John T. Cooper, Pine Bluff, Ark.
Application December 3, 1952, Serial No. 323,835
5 Claims. (Cl. 137—620)

1. A valve control system comprising a plurality of valves each controlling an individual pipe line, individual operating means for each valve comprising a self-contained unit detachably secured to the valve, each unit being responsive to pressure for opening its respective valve and responsive to vacuum for closing its respective valve, a pressure control line entirely separate from and independent of said individual pipe lines and said units, jet means in said control line, valve means in said control line, and conduit means connecting said jet means with said operating units, said valve means being operable to subject said conduit means and operating units selectively to vacuum and pressure whereby simultaneous operation of the plurality of valves in both opening and closing direction can be positively effected.

---

**2,771,695**
**METAL BELLOWS FORMATION**
Melville F. Peters, East Orange, N. J.
Application January 2, 1951, Serial No. 203,901
2 Claims. (Cl. 137—796)

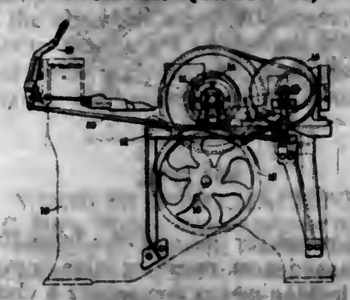
2. A high pressure bellows consisting of a plurality of flanged bellows membranes having flat flanges at their edges, said flanges of each membrane lying in a common plane and alternately secured together at their flanged portions, each membrane consisting of a single sheet of metal and the aforesaid flanges and an asymmetrically curved portion joining said flanges, the curve being generally arcuate and tangent at one point to a line drawn parallel to the plane of the flanges and said point of tangency lying intermediate the midpoint of said curve and the juncture of the inner flange and curved portion.



---

**2,771,696**
**FLUID TIGHT CLOSURE**
Burton Ver Nooy, Tulsa, Okla., assignor to T. D. Williamson, Inc., Tulsa, Okla., a corporation of Oklahoma
Application May 5, 1954, Serial No. 427,700
18 Claims. (Cl. 138—89)

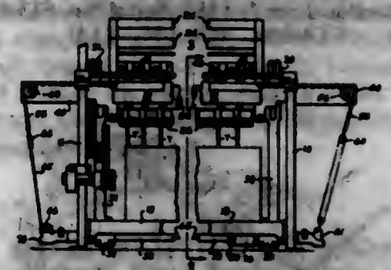
1. A fluid tight closure for a connecting conduit between pressure vessels, wherein the conduit is provided with locking means, said closure comprising a body insertable from one of the vessels into a locked position within the conduit, locking means on the body for cooperation with the conduit locking means in said locked position, seal means about the body and positioned relative to the locking means for sealing engagement with



the conduit during insertion of the body into locked position, and bypass valve means in the body adapted

to be opened to permit communication between said vessels during insertion of the body and to be closed after said insertion to prevent said communication.

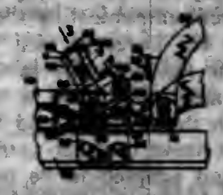
---



**2,771,697**
**LOOM DRIVE MEANS**
Clifford G. Mecn, Hopedale, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine
Application October 12, 1953, Serial No. 385,434
2 Claims. (Cl. 139—1)

1. In a loom the combination of a loomside, a crankshaft and a camshaft carried in bearings in said loomside, gears interconnecting said crankshaft and camshaft thereby to drive one from the other and means for driving one of said shafts which comprises an electric motor supported at said loomside, said motor having an end shield, a shaft and pinion, a second shaft fixed in said end shield in laterally spaced, parallel relationship to said motor shaft and an internally toothed gear rotatably carried by said second shaft with which said pinion is in mesh, V-belt pulleys, one on that first mentioned driven shaft and a second which forms a part of said internally toothed gear and a V-belt running over said pulleys.

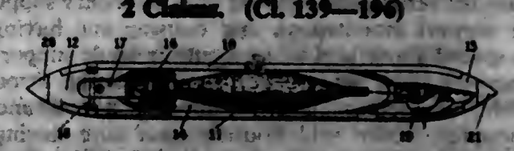
---



**2,771,698**
**PICKING MOTION FOR A LOOM**
Edgar A. Ross, Anderson, S. C.
Application November 8, 1954, Serial No. 467,438
4 Claims. (Cl. 139—138)

1. In a loom having a frame, a lay, a reed, a driven cam shaft, a plurality of oscillatable shuttles, a rack movable longitudinally of said lay, gear means engaging said rack for transmitting movement to said shuttles and swords supporting said lay, shuttles and reed; the combination of a tubular rock shaft journaled in the lower portion of said frame and supporting said swords, first and second sprocket wheels journaled on opposite ends of said lay, first and second sprocket chains connected to opposite ends of said rack and passing over and partially around the respective first and second sprocket wheels, a tension spring connected at one end to the end of the first chain remote from the rack and having its other end connected to one end of said rock shaft, a first pulley in the other end of said rock shaft, a bracket loosely mounted on said rock shaft and spaced substantially from said first pulley, said rock shaft having a slot therein adjacent said bracket, second and third spaced pulleys journaled in said bracket, the second pulley projecting through said slot, a cam fixed on said cam shaft, a lever pivotally suspended on said frame adjacent said cam, follower means on said lever engaging said cam, and a pliable element having one end connected to the second chain and extending downwardly, partially around the first pulley, longitudinally in said rock shaft, through said slot in engagement with said second and third pulleys and being connected at its other end to the lower portion of said lever.

---



**2,771,699**
**CHECK FOR PICKING MECHANISM**
George W. Pearce, Danvers, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts
Application July 28, 1954, Serial No. 444,582
13 Claims. (Cl. 139—147)

1. In checking mechanism for a loom picking shaft having a thrust member moving therewith, stationary support means, a primary plunger slidable on said support means and positioned for engagement with and movement by the thrust member during a checking operation of the mechanism, a secondary plunger also slidable on said support means but in a direction transverse of the direction of sliding movement of the primary member, coacting surfaces on said plunger at least one of which is inclined to the direction of movement of the primary plunger, said coacting surfaces effective due to movement of the primary plunger by the thrust member to cause movement of the secondary plunger in a direction away from said primary plunger, and resilient means resisting movement of the secondary plunger away from said primary plunger, said resilient means comprising two sets of coacting rings, the rings for one set being subjected to a force tending to expand them and the rings of the other set being subjected to a force tending to compress them when the secondary plunger has said movement in a direction away from the primary plunger.

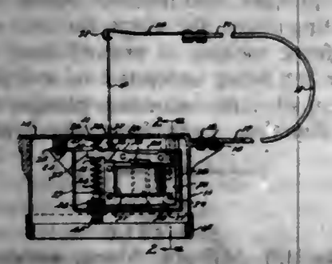
---

**2,771,100**
**SHUTTLE**
Paul C. Consoletti, Milford, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine
Application June 11, 1953, Serial No. 361,028
2 Claims. (Cl. 139—196)

1. A shuttle for looms having side and end members bonded into a unitary structure defining a bobbin cavity in which the said side members are formed as a laminate and the end members are a macerate type of molded plastic material, said side members comprising reinforcing lamina bonded by a phenolic resin, said lamina comprising a

fabric in which components extending in the direction of the length of the shuttle are predominantly of a synthetic resin such as nylon and those components directed transversely to those first mentioned are predominantly of cotton.

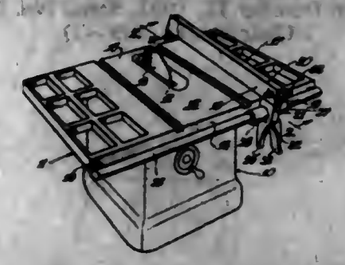
---



2,771,101
**STORAGE BATTERY FILLER**
Niles J. Thompson, Williamsville, N. Y., assignor to Gould-National Batteries, Inc., St. Paul, Minn.
Application March 12, 1954, Serial No. 415,882
5 Claims. (Cl. 141—57)

3. A device for filling a storage battery with electrolyte comprising a body member having dual bores leading thereinto from an open end battery connection portion thereof, said body member having an air passageway at its other end intercommunicating the ambient atmosphere with one of the bores of said body member, a source of electrolyte liquid supply in open communication with said last mentioned bore, a vacuum source in communication with the other of said bores, and a normally open resilient valve member carried by said other end of the body and adapted to be manually movable into air passageway sealing position whereby vacuum forces within said bores will cause electrolyte to be drawn into said device and delivered therefrom at the open end thereof until such time as the level of electrolyte in said battery reaches the bottom ends of said bores whereupon the vacuum forces drawing electrolyte into said device will be interrupted.

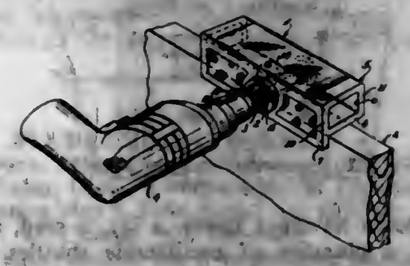
---



2,771,102
**VIBRATORY ELECTRIC CUTTING TOOL**
Thomas Frazer Carmichael, Plymouth, Mich., assignor to Syncro Corporation, Oxford, Mich., a corporation of Michigan
Application August 24, 1950, Serial No. 181,272
1 Claim. (Cl. 143—73)

In a cutting tool, a housing having a work table thereon, means for resting said housing on a stationary support, a blade support mounted on said housing and having a portion spaced above said table, a cutting blade supported at its upper end by said support and extending through said table, an electromagnet comprising a coil and a core mounted within said housing, said core having a plurality of spaced poles, an armature of rigid construction disposed between said electromagnet and said table and mounted for vibratory movement to and from said table about a fixed pivotal axis adjacent one of said poles, the lower end of said blade being operatively connected to said armature, the armature being inclined upwardly from said pivotal connection toward said table, whereby operative movement of said armature will impart a slight transverse component of movement to said blade, an upper coil spring having its upper end abutting the undersurface of said table and its lower end engageable with said armature so as to aid the attractive force of said electromagnet, and a lower coil spring aligned with said upper spring and having its upper end engageable with said armature so as to oppose said attractive force, said springs being laterally spaced from said electromagnet poles whereby the operative surfaces of said poles are uninterrupted.

---

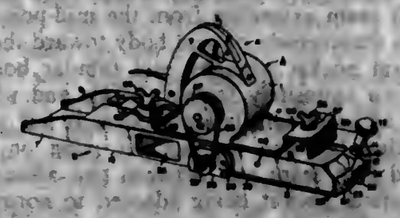


2,771,103
**FENCE FOR THE WORK-SUPPORTING TABLE OF A POWER TOOL**
William H. Odlum, Wilmette, and William F. Hosford and Clarence C. Wiesse, Chicago, Ill., assignors to Duro Metal Products Co., Chicago, Ill., a corporation of Illinois
Application February 23, 1954, Serial No. 411,796
3 Claims. (Cl. 143—174)

1. A locking means for one end of a fence for a power tool having a flanged work-receiving table in proximity to the fence, said locking means comprising a clamping element having a hook at one end adapted to engage the free edge of the flange, a first cam surface on the element, a stationary follower for the cam disposed on the fence, resilient means for drawing the cam against the follower, the cam and follower being arranged to raise and hold the hook against the flange under the drawing action of the resilient means, means mounting said fence over the table for oscillatory movement toward and away from the top of the table and for movement substantially parallel to the edge of the table, and a second cam disposed on the outside of the hook to strike the edge of the table and to move the element out of the way of said table edge to permit the hook to pass around and latch against the free edge of the flange when the fence is oscillated toward the table.

---

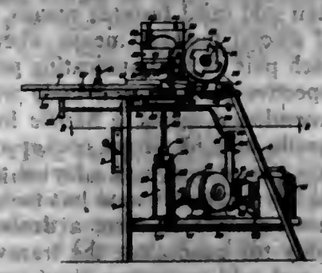
2,771,104
**PLANER ATTACHMENT FOR ELECTRIC DRILLS OR THE LIKE**
Raymond J. Saxe, Akron, Ohio
Application June 3, 1955, Serial No. 513,052
5 Claims. (Cl. 144—114)



3. A plane comprising a tubular one-piece frame having a pair of opposed recesses provided in opposite side walls thereof and a base portion with an opening therein extending intermediate said recesses, a cutter cylinder, shaft means for said cutter cylinder engaged with and extending from said cutter cylinder, bearing means engaging said shaft means to journal said cutter cylinder

at opposite ends thereof in said frame, and means for securing said cutter cylinder and bearing means in said frame.

---



2,771,105
**POWER DRIVEN HAND TOOLS**
Boris G. Motoff, Dallas, Tex., assignor to Rotex Company, Dallas, Tex., a corporation of Texas
Application September 14, 1953, Serial No. 534,217
12 Claims. (Cl. 144—117)

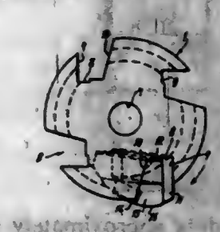
1. For use with a power driven hand tool having a housing, an electric motor and a shaft; a jointer and planer attachment comprising a body-member having a downwardly opening transverse chamber, a cutter operatively mounted in the chamber, means for operatively connecting the cutter to the shaft, a work-contacting shoe adjustably mounted on the body-member, and means for detachably securing the body-member to the housing.

---

2,771,106
**WOOD SHAPING MACHINE**
Clarence C. Sigle, Wabbaseka, Ark., assignor of one-half to William H. Boswell, Wabbaseka, Ark.
Application July 19, 1955, Serial No. 522,978
6 Claims. (Cl. 144—134)

2. A machine for shaping the ends of elongated pieces of wood, comprising a pattern cutter rotatable about an axis, a work carrier, an elongated work supporting backing-up bar supported on said carrier and disposed transversely of said axis, said backing-up bar having a contoured end surface conforming with said cutter and disposed in the cutting path thereof, means for effecting relative movement of said cutter and said work carrier transversely of said axis with the cutting action of said cutter being opposed to said backing-up bar, and means for supporting an elongated wood piece on said backing-up bar with an end thereof projecting slightly beyond said contoured end surface for contour cutting action thereon by said cutter and with said wood piece being fully supported adjacent said cutting path.

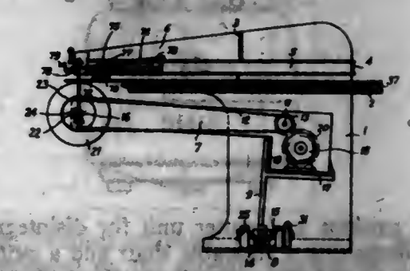
---



2,771,107
**SHAKE SPLITTING MACHINES**
John G. Vassy, Portland, Oreg.
Application May 17, 1955, Serial No. 509,035
6 Claims. (Cl. 144—193)

3. In a shake splitting machine the combination of a pair of spaced apart freely floating knife plates which have their adjacent edges oppositely bevelled to form a splitting wedge on each knife plate and a cam bar upon which a knife plate is freely and teeterably supported.

---

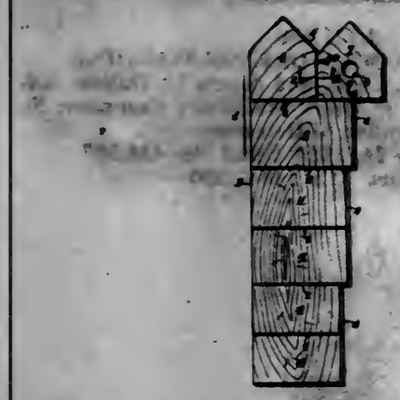


2,771,108
**CUTTER FOR WOODWORKING MACHINE**
Momir Babunovic, St. Louis, and Norris D. Dalton, Affton, Mo., assignors to Quirk Machinery Company, St. Louis, Mo., a corporation of Delaware
Application May 26, 1954, Serial No. 432,587
3 Claims. (Cl. 144—229)

1. A cutter for a woodworking machine, comprising a head having end faces and a bore normal thereto adapted for mounting the same on a shaft for rotation, said head having a substantially straight blade-receiving slot in its peripheral portion, said slot extending at an angle to a plane through the axis of said bore and crossing such plane between said end faces, and a flat cutter blade secured in said slot, said blade having a cutting edge and a warped surface adjacent said edge formed to provide a positive rake angle at any point along said edge.

---

2,771,109
**WOOD-BENDING MACHINE**
Karl Michaelis, Paris, France
Application November 8, 1952, Serial No. 319,587
7 Claims. (Cl. 144—254)

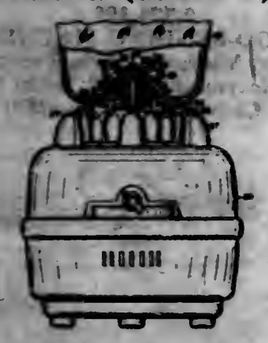


1. In a wood-bending machine the combination, with a machine bed, of a drum shaft, a former-drum on said shaft and an abutment member positioned in opposed relation to the drum for cooperation with the drum to contact opposite sides of the work extending between them, a lever pivoted to said machine bed on a horizontal axis for rocking movement in a vertical plane and supporting, lifting and lowering said shaft, mounted at one end, in exactly horizontal position, means at the rear end of said lever for fixing said lever and shaft at any level determined by the drum radius and means for rotating said drum.

---

2,771,110
**STRUCTURAL ASSEMBLY KIT**
Ruth Gebhardt Tuck, Coatesville, Pa.
Application December 1, 1953, Serial No. 395,487
5 Claims. (Cl. 144—309)

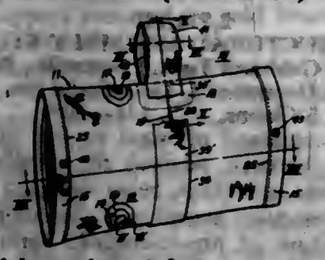
1. A blank composed of wood or like material of a character and thickness adapted for division by hand cutting operation, said blank being designed to yield by division and subsequent assembly of the component parts thereof a structure of pre-determined form and being shaped in accordance with the requirements of said structure, and means for indicating on a face of said



blank the lines of division on which the blank may be separated into said component parts, said indicating means comprising weakened portions having sufficient depth and width to receive the cutting edge of a cutting blade

of a width corresponding approximately to the width of said weakened portions to thus direct the cutting blade in the desired course and to afford support for the sides of the cutting blade during the dividing operation.

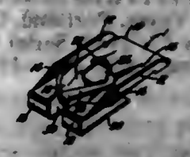
---



**2,771,111**
**AGITATOR AND CUTTER UNIT FOR DISINTEGRATING FOOD MIXERS**
Arthur W. Seyfried, Racine, Wis., assignor to Scovill Manufacturing Company, Waterbury, Conn., a specially chartered corporation of Connecticut
Application September 30, 1955, Serial No. 537,803
11 Claims. (Cl. 146—68)

1. An agitator and cutter unit for disintegrating food mixers comprising a rotatable shaft and a cutter member comprising a radially upwardly inclined blade having an annularly concave upper surface and a convex lower surface, and a radially downwardly inclined blade having an annularly convex upper surface and a concave lower surface, said blades being mounted on the shaft to rotate therewith and conforming to the surface of a frusto-conical section whose axis is coincident with the axis of rotation of said blades.

---

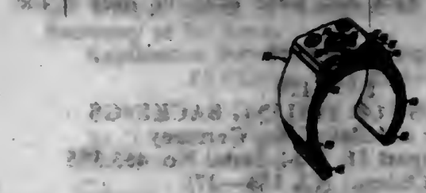


**2,771,112**
**SHOPPING AND TRAVELING BAG PURSES**
Elizabeth Alleen Ingram, Cincinnati, Ohio
Application February 7, 1955, Serial No. 486,352
4 Claims. (Cl. 150—35)

1. A hand bag adapted for use as a purse and as a shopping and traveling bag, said bag comprising a plurality of substantially rectangular members joined together in registry by first and second seams along a pair of opposite parallel edges to form a tubular body having multi-ply walls joined together by said seams, one of said walls having at least a cover ply, an inter ply, and a lining ply, third and fourth seams securing the end edges of the several plies in each wall of the body together in registry annularly of the mouths of said body, a structure whereby a pocket is formed projecting laterally into said tubular body with its mouth disposed centrally of said first seam with its bottom spaced from the second seam, a fifth seam extending from the mid-point of said second seam transversely of said body toward the bottom of said lateral pocket whereby said tubular body is divided into two oppositely facing pockets and whereby a passageway adjacent said lateral pocket is left providing communication between the pockets lying on opposite sides of said fifth seam and between two adjacent body plies, said lateral pocket being adapted to normally and substantially close the communicating passageway and being movable into substantially non-obstructing relation thereto, first and second slide fastener means for respectively closing the mouth of each of said oppositely facing pockets, said fastener means extending substantially between the first and second seams, and adjacent and parallel to the third and fourth seams, respectively, a third slide fastener means parallel to and between said fifth seam and said second mouth closing fastener means and adapted for closing an aperture in the lining ply of said body intermediate said first and second seams, a fourth slide fastener means adjacent said second fastener means and adapted for closing an aperture in said inter ply of said body disposed adjacent said lining ply and between said lining ply and the cover ply of said body, said fourth fastener means being spaced farther from said fifth seam than said third fastener means, and nearer thereto than said second fastener means whereby access may be had to each pair of communicating pockets lying between said respective plies of said body wall and between said first mentioned seams, a handle loop secured to said body laterally of said lateral pocket and projecting perpendicularly to said body and adapted to be folded for storing in said lateral pocket, said handle loop having extensions which co-operate to form a decorative band encircling said body for concealing the transverse seam, said handle loop and said encircling band portion being of substantially flattened tubular cross section and having apertures closable by slide fastening means in the wall thereof facing said body to provide concealed access to storage pockets therein, said body being foldable along a line parallel to said encircling band portion, and means for securing said body in folded relation with the mouths of the oppositely facing pockets disposed in side-by-side relation whereby said means is adapted for use as a purse.

---

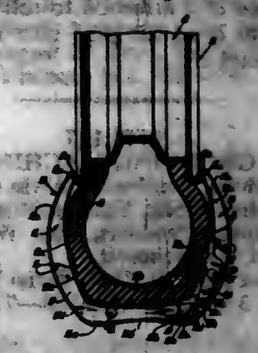
**2,771,113**
**SHEET METAL LOCK NUT WITH SPRING LOCKING ARM**
Laurence H. Flora, Cleveland, Ohio, assignor to Thanerman Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application August 18, 1953, Serial No. 374,950
4 Claims. (Cl. 151—11)



1. A fastener comprising a piece of sheet metal having a return bent portion defining a pair of spaced slightly converging body portions extending in the same general direction and adapted to receive therebetween in attached relation any of several apertured parts of different thicknesses between the limits of a thin part of considerably less thickness than the spacing of said body portions to a thick part having a thickness slightly less than the spacing of said body portions, one of said body portions being provided with a yieldable base stamped therefrom having a free end extending toward said return bent portion of the fastener, said yieldable base having an opening and thread engaging means on the periphery of said opening for threadedly engaging a bolt or screw, said yieldable base being bent bodily inwardly toward the other body portion such that said free end thereof is spaced from said other body portion a distance less than the thickness of any part with which the fastener is intended to be used, said inwardly bent yieldable base being adapted to yield in accordance with the thickness of the part to which the fastener is applied to cooperate with said other body portion of the fastener in engaging opposite sides of said part in the attached position of the fastener thereon, said yieldable base in such attached position of the fastener being adapted to lie substantially parallel to the part to which the fastener is applied with said other body portion in surface engagement with said part regardless of the thickness of said part and with said thread engaging means on said yieldable base in position for even and uniform threaded engagement with a bolt or screw to be applied to said thread engaging means with the axis of said bolt or screw in normal relation to said part, said return bent portion and said other body portion having a partially severed area therein extending lengthwise of the fastener from the free end of said yieldable base and defining an elongate spring arm integral with said free end of said yieldable base, said spring arm being return bent in overlying generally parallel relation to said yieldable base and having its inner longitudinal edge adjacent said opening in said base for engaging a bolt or screw in cooperation with said thread engaging means.

---

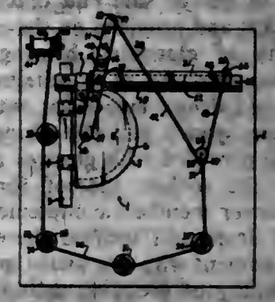
**2,771,114**
**TIRE TREAD CONSTRUCTION**
Martin Negrete Laborale, Madrid, Spain
Application December 15, 1953, Serial No. 398,384
Claims priority, application Spain February 20, 1953
4 Claims. (Cl. 152—209)



1. An elastic tire construction comprising a carcass, side walls and a tread surface, said tread surface including a plurality of substantially cylindrical cavities, a concentric ring surrounding each said cavity, and an annular incision defining the outer periphery of each said concentric ring.

---

**2,771,115**
**TIRE LUG**
Edmund V. Brown, St. Catharines, Ontario, Canada
Application July 30, 1953, Serial No. 371,271
10 Claims. (Cl. 152—228)



1. A traction lug for a tire and wheel rim assembly which comprises a pair of L-shaped clamp members each having a curved upright leg adapted to embrace the side wall of a tire and a bottom leg adapted to underlie the tread of a tire, said upright legs having abutment shoulders extending inwardly therefrom for overlying a wheel rim, a pivot connecting said clamp members adjacent the free end of the bottom leg portion of one clamp member and at the junction between the side and bottom legs of the other clamp member, said clamp members having depending knee portions at the junctions between their side and bottom legs thereof to provide ground engaging abutments projecting outwardly from the bottom legs, one of said clamp members having ratchet teeth on the free end thereof, the other of said clamp members having a dog pivoted on the side leg thereof adapted to engage said ratchet teeth, and said dog having a head portion adapted

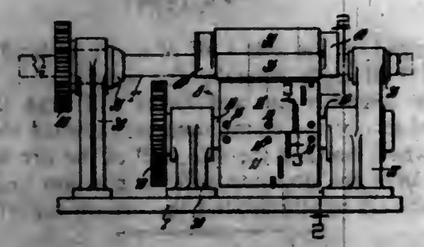
to be engaged by the side wall of a tire to hold the dog in one of said teeth whereby the weight of a tire and wheel rim assembly on said knees will urge the abutment shoulders of the clamp members toward each other over the wheel rim and the side wall of the tire will automatically urge the dog into locking position to hold the clamp members tightly around the tire on the wheel rim.

---

**2,771,116**
**PIPE BENDING MACHINE FOR INDUSTRIAL PIPING**
Sam L. Ballard, Houston, Tex.
Application October 26, 1951, Serial No. 253,336
8 Claims. (Cl. 153—45)

1. A pipe bending machine comprising a support, a rigid die anchored on the support and having a working face with a bend forming portion shaped to conform to the curvature of the inside of the bend to be produced in a pipe, a rockably mounted holding shoe on the support opposed to the curved die adjacent one end thereof and movable toward and away from the curved die, a separate independently mounted rigid bending shoe shaped to conform to the shape of the pipe before bending and in initial position before bending of the pipe having a first part directly opposed to the bend forming portion of the working face of the curved die and extending past the central point of the face of the die toward the holding shoe and a second part located and extending a substantial distance beyond the bend forming portion of said face in a direction away from said holding shoe, shackle means pivotally connected inwardly to said support and including means thereon adapted to maintain rolling contact with the surface of said shoe first part opposite the bend forming face portion thereof, a line connected at a first end to said shoe at substantially the end of said second part, a bridle block, said line extending from said first end through said bridle block and connected at the other end thereof to said shackle outwardly of said rolling contact means, and power means connected to said bridle block and adapted to pull upon said bridle block as said bridle block slides along said line, the pull of said power means as transmitted through said bridle block to said

other end causing said rolling contact means of said shackle to force said shoe first part toward the die to cause the bending shoe and die to tightly embrace a pipe at the locus of bending during the bending operation while permitting the bending shoe to roll in contact with said die, said pull of said power means as transmitted through said bridle block to said first end acting transversely of said bending shoe in a direction to roll said bending shoe along said die to bend the pipe into said bend forming face portion of said die.



---

2,771,117

## GROOVING MACHINE

Alfred L. Le Febvre, Southwick, Alvin O. Johnson, Westfield, and Walter J. Sitz, Easthampton, Mass., assignors to Stanley Home Products, Inc., Westfield, Mass., a corporation of Massachusetts

Application May 19, 1955, Serial No. 509,588
3 Claims. (Cl. 153—73)

1. Apparatus for forming longitudinally spaced annular grooves along an elongated tubular handle or the like comprising in combination, a support, relatively spaced end brackets and an intermediate bracket extending upwardly from said support, an elongated drum having a shaft rotatable in one of said end brackets and said intermediate bracket and provided on the outer face thereof with a plurality of elongated bearing sockets having longitudinal axes disposed in parallelism with the axis of rotation of said drum, means for rotating said drum, the sockets being spaced helically along said drum and said drum being provided with grooves at opposite transverse sides of the sockets thereof for grooving rolls, relatively thin cover members complemental to the outer surface of said drum and secured thereto and provided with slots in alignment with the socket grooves for grooving rolls, a plurality of grooving rolls in the grooves of said drum and extending through and beyond the slots of said cover members having journals rotatable in said sockets and held therein by said cover members, driving means for rotating a tubular handle adjacent said drum on an axis parallel to that of said drum, and guide means for guiding a handle during rotation thereof.

---

2,771,118

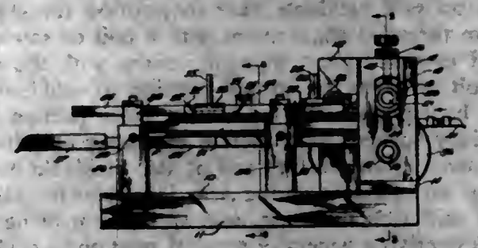
## METHOD AND APPARATUS FOR MAKING UNWOVEN FABRIC FROM BAST FIBERS

Emilian Bobkowicz, Montreal, Quebec, Canada

Application October 3, 1952, Serial No. 312,968
Claims priority, application Canada August 28, 1952
3 Claims. (Cl. 154—1.75)

1. A method of making non-woven fabric from fleece of crude bast fibers which comprises feeding the fleece forward continuously, dividing the fleece into side-by-side portions, carrying one portion through a circuitous path and another portion through a direct path, said circuitous path being in a direction transverse to the width of the fleece, spreading both portions laterally to substantially the same width, and bringing the portions together whereby the ends of the fibers making up an individual stalk of the bast plant fall in different areas longitudinally of the resulting sheet.

2. An apparatus of the type described, comprising in combination means for conveying a fleece of long fibers in a substantially direct path and means for conveying a portion of the fleece through a circuitous path out of the plane of travel of the fleece, means for spreading the portions of the fleece in their respective paths in a lateral direction in the plane of travel of the fleece and for bringing the respective portions together again in the plane of travel of the fleece.



---

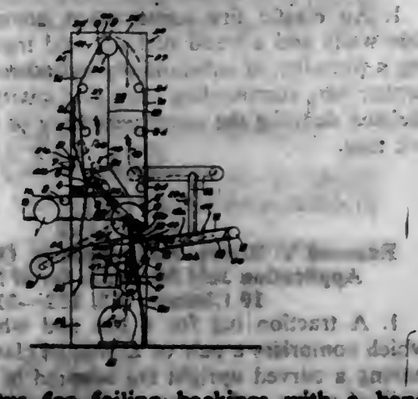
2,771,119

## APPARATUS FOR PLEATING PAPER

Carl G. Heckett, Uxbridge, Mass., Walter V. Kennedy, Central Falls, R. I., and Chester A. Vander Pyl, Jr., North Attleboro, Mass., assignors to Frank Corporation, East Providence, R. I., a corporation of Rhode Island

Application February 11, 1955, Serial No. 487,642
12 Claims. (Cl. 154—30)

1. Apparatus for pleating an advancing sheet of filter paper, comprising a pair of feed rolls each having a sheet engaging outer surface, scoring blades extending longitudinally of the rolls and protruding slightly from the roll surface in staggered relation one to the other so that when the rolls are rotated they continuously engage and advance the sheet and score it at first one face and then the other, a guide way for the pleated sheet delivered by the rolls, and means for retarding the advancing movement of the pleats along the guide way to thereby cause the paper to bend back and forth near the rolls at the score lines.



---

2,771,120

## APPARATUS FOR FOILING BACKINGS

Werner Achilles, Celle, Germany

Application August 31, 1954, Serial No. 453,395
12 Claims. (Cl. 154—37)

1. An apparatus for foiling backings with a band-shaped foil containing a cellulose compound comprising, in combination, a housing having a front wall, a top wall, and a rear wall, a cylinder arranged outside said housing opposite to said front wall thereof, said cylinder being adapted to carry a roll of band-shaped foil, means for pulling said band-shaped foil from said cylinder through a first opening in said front wall of said housing, a glue-applying device arranged inside said housing near said first opening in said front wall thereof, said glue-applying device applying glue to said band-shaped foil after the same has passed said first opening in said front wall of said housing, means for guiding said band-shaped foil covered with glue upwards in said housing near said front wall thereof, wall means arranged substantially vertically in said housing between said front and rear walls thereof, so as to separate said housing into a front part and a rear part, said wall means having an upper edge arranged at a distance from said top wall of said housing, a roller arranged above said upper edge of said wall means and separated by a gap from said top wall of said housing, said roller guiding said band-shaped foil through said gap so that the same descends in said rear part of said housing, a first foil-spreading roller arranged in said front part of said housing in contact with said roller separated by said gap from said top wall of said housing, means for guiding said band-shaped foil downwards through said rear part of said housing, a heatable pressure roller arranged near the lower part of said rear wall of said housing below said means for guiding said band-shaped foil downwards, a second foil-spreading roller arranged above said pressure roller in contact therewith, a counterpressure roller arranged below said pressure roller near said lower part of said rear wall of said housing, a device arranged outside said housing opposite said rear wall thereof for leading a backing into said housing through an opening arranged in said rear wall thereof opposite the common edge of said pressure roller and said counterpressure roller whereby said backing and said band-shaped foil are passed between said pressure roller and said counterpressure roller, so as to form a back foil, and take-up cylinder arranged outside said housing opposite said front wall thereof, said take-up cylinder spooling said backed foil after the same has passed a second opening in said front wall of said housing.

---

2,771,121

## METHOD AND MACHINE FOR ADHESIVELY LAP SEAMING FABRIC

Rex Stuart MacCaffrey, Boiling Springs, Pa., assignor to the United States of America as represented by the Secretary of the Army

Application July 23, 1954, Serial No. 445,491
15 Claims. (Cl. 154—42)

3. In a machine for lap seaming together side edge portions of two stripe of textile material, means mounting said stripe in longitudinally spaced and laterally offset relation with adjacent side edge portions in slightly overlapping relation, means for moving said strips toward each other, means for applying adhesive coatings to the same surface of each of said edge portions, means for directing said strips unidirectionally with said coated edge portions in abutting relation, and said last-named means including means for pressing said abutting edge portions together to form a lap seam.

9. In a method of continuously adhesively lap seaming together side edge portions of two strips of textile material, the steps of continuously and slowly moving said strips toward each other, applying a narrow strip-like coating of adhesive to the same surface of a side edge portion of each strip, allowing said coatings to be conditioned desirably as said strips move toward each other, positioning said moving strips in overlapping relation with said coated edge surfaces abutting, and pressing said abutted edge surfaces together to form a lap seam.

---

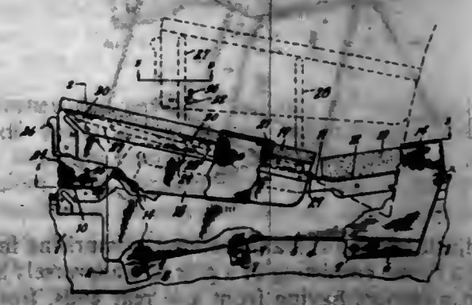
2,771,122

## REMOVABLE COVER LAWN CHAIR

Carl Straub, Nebraska City, Nebr.

Application August 28, 1953, Serial No. 377,033
3 Claims. (Cl. 155—84)

2. In a lawn chair, a frame comprising a first C-shaped bottom portion normally horizontally disposed and resting on the floor with its open side facing forwardly, a pair of upright portions attached to the forward ends respectively of said bottom portion, a second approximately horizontally disposed C-shaped portion having its open end facing forwardly and with its forward ends attached to said upright members respectively, a support disposed transversely between said upright members and attached to the upright members at points approximately mid-way of their lengths, an inverted U-shaped upright frame portion disposed within said second C-shaped portion and forming a back frame portion for the chair and having upright side portions, substantially horizontal seat supporting side members disposed at the sides of the chair and extending forwardly from and attached to said side portions respectively of said upright U-shaped back frame portion, the forward ends of said side members being pivotally secured to said support whereby the said back frame portion and seat supporting side members may be pivoted and swung forward, and means attached to said upright U-shaped portion for forming a back and means attached to said side members for forming a seat.



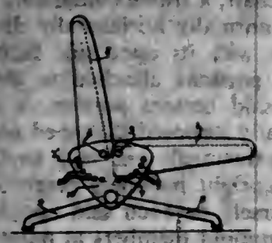
---

2,771,123

## COLLAPSIBLE ARMRESTS FOR AUTOMOBILE SEAT CUSHIONS AND THE LIKE

Ivan Freeman Clark, Lyons, Mich., assignor to Ivan Clark Manufacturing Company, Lyons, Mich.

Application September 13, 1954, Serial No. 455,636
7 Claims. (Cl. 155—112)



1. An arm rest comprising a base of downwardly facing channel section adapted to embrace a longitudinally extending raised portion of a motor vehicle body structure, the base having an upwardly facing recess at its front end, a rearwardly inclined front top portion at the rear of the recess and a forwardly inclined rear top portion, an arm rest of downwardly facing channel section provided with a front wall, a pair of loop-like arm rest supporting links pivotally mounted on the rearwardly inclined front portion of said base and pivotally connected in parallel relation to the underside of the top of said

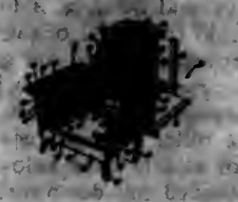
arm rest to be swung rearwardly to an erected position or to collapse forwardly upon the base with the arm rest in embracing relation to the base and with its front wall constituting a closure for said recess, a pair of oppositely facing catches pivotally mounted on the inner side of said front wall to fit within said recess, a link pivotally connected to said catches and constituting a catch actuating finger piece which is accessable from beneath the arm rest when it is in erected position, and a spring acting to bias said catches into engagement with the forward arm rest supporting link when the arm rest is in erected position.

---

2,771,124
**DIVAN WITH INDEPENDENTLY ADJUSTABLE BACK AND SEAT**
Osvaldo Bersani, Milan, Italy
Application January 10, 1955, Serial No. 480,925
Claims priority, application Italy September 14, 1954
5 Claims. (Cl. 155—118)

1. An article of furniture comprising a base support, a back member, first means pivotally mounting the back member on the base support for vertical swinging movement of said back member, a seat member, second means pivotally mounting the seat member on the base support for vertical swinging movement independent of the movement of the back member, said first and second means being disposed in the same horizontal plane and cooperative means on the base support concentric to said first and second means and on each of the back and seat members for locking said members in selected positions of relative angularity.

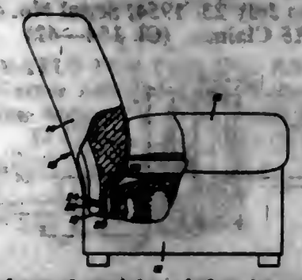
---



2,771,125
**ADJUSTABLE AND FOLDABLE CANOPY**
Albert L. Debbins, Kansas City, Mo.
Application April 6, 1954, Serial No. 421,318
1 Claim. (Cl. 155—154)

An adjustable and foldable canopy, comprising in combination a frame consisting of a pair of transversely spaced rigid top members having front and rear ends, front and rear cross members connected to and extending between the respective front and rear end portions of said top members, front and rear pairs of downwardly extending legs pivotally attached at their upper ends to the respective front and rear ends of the top members and having pointed lower end portions adapted for insertion in the ground, the front and rear legs in each pair being mutually downwardly divergent and movable toward and away from each other whereby the height and angularity of said top members relative to the ground may be adjusted, a pair of side members having upper ends pivotally attached to the rear end portions of said top members, lower ends of said side members being adapted to rest on the ground in an adjusted relation to the top members, a cross piece connected to and extending between the lower ends of said side members, and an elongated sheet of flexible material anchored at one end thereof to the front cross member, said sheet extending continuously over the rear cross member and under said cross piece and forwardly of the latter, whereby to constitute the top and the back and the bottom of the canopy.

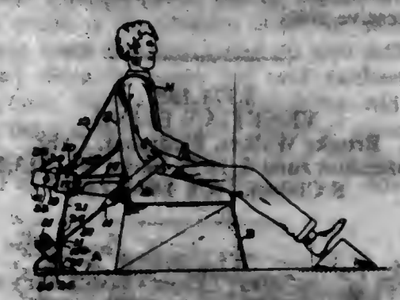
---



2,771,126
**FURNITURE CONSTRUCTION AND METHOD**
Charles Steil, Great Neck, N. Y.
Application June 7, 1956, Serial No. 589,956
6 Claims. (Cl. 155—184)

1. A frame for a piece of upholstered furniture comprising marginal members of bent metal defining the general outline of said piece of furniture, a plurality of spaced apart reinforcing members arranged in criss-cross relation and joined at their cross over points and to said marginal members to provide a body for said frame, said marginal and reinforcing members being shaped and contoured to attain the prescribed line for said piece of furniture, relatively flat tacking strips arranged inwardly of and adjacent said marginal members, and means extending through said tacking strips and engaging said body for fixing said tacking strips in position against said body, said tacking strips following the line of said piece of furniture as prescribed by the shape and contour of said members and affording a support to receive tacking for upholstering said frame.

---



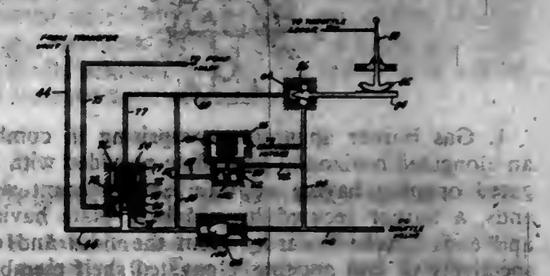
2,771,127
**RECEPTACLE FOR UPHOLSTERED FURNITURE**
Clifford C. Cole, Hayward, Calif.
Application September 15, 1953, Serial No. 380,932
1 Claim. (Cl. 155—188)

In an upholstered article of furniture having a back and a seat forming a crevice therebetween, an elongated open top and flexible receptacle for foreign matter removably inserted downwardly in said crevice, said receptacle comprising a closed bottom and ends, and side walls provided with top edges normally yieldingly bowed outwardly for frictional engagement with said back and seat, the bottom of the receptacle comprising a thickened solid portion of wedge shape in cross-section with a transversely rounded leading edge for facilitating insertion of the receptacle downwardly in said crevice, said bottom portion having a resilient reinforcing rib embedded longitudinally therein to yieldingly oppose deformation of said portion when the receptacle is being inserted, and a pair of handles attached to one side wall adjacent said ends and extending upwardly out of the receptacle for grasping to remove said receptacle.

2,771,128
**RIBBON BRAKE UNIT WITH INERTIA CONTROL**
Donald B. Deeblide, Wilmington, Del., assignor, by mesne assignments, to All American Engineering Company, Wilmington, Del., a corporation of Delaware
Continuation of application Serial No. 141,563, January 31, 1950. This application August 15, 1952, Serial No. 304,483
4 Claims. (Cl. 155—189)

2. Shock absorbing means for vehicle carried seats comprising an elongated flexible member movable in response to forward forces imparted from the shoulder straps and waist straps of an occupied safety harness to which one end of said member is connected, said flexible member having its opposite end resiliently and yieldably connected to a fixed element of the vehicle, brake shoes mounted in a brake housing fixed with respect to said flexible member and on each side of the member, power means comprising a fluid actuated piston and a source of uniform fluid pressure, an accelerometer responsive to crash developed acceleration forces for releasing said fluid pressure to said piston to actuate the brake shoes into slipping engagement with said flexible member under predetermined load, said member absorbing energy by said slipping action, to thereby restrain the forward movement of the wearer of the harness and occupant of the associated seat below the threshold of a maximum tolerable acceleration.

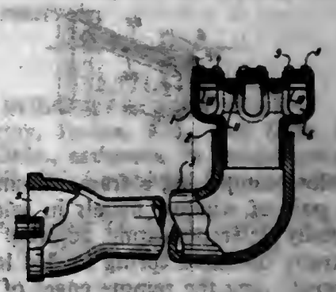
---



2,771,129
**ARMREST STRUCTURE FOR FURNITURE**
John G. Platt, Carthage, Mo., assignor to Flex-O-Lators, Inc., Carthage, Mo., a corporation of Missouri
Application February 27, 1953, Serial No. 339,231
1 Claim. (Cl. 155—196)

An arm rest structure comprising a fixed base, a series of coil springs anchored at their lower ends to said base, an open frame member disposed about the margin of said series of springs at the upper ends thereof and secured thereto, a series of parallel, spaced apart transverse wires extending across and secured at their opposite ends to said frame, a pliable strand extending transversely to said wires and connected to each of said wires intermediate its ends, fabric members secured in said frame along their upper edges by reason of the piercing of said fabric by said transverse wires, and secured along their lower edges to said base, said fabric members being tensioned whereby to pre-load said springs, padding disposed over said spring assembly, and upholstery fabric disposed over said padding and secured to said base, said transverse wires being closely spaced whereby to prevent said padding from working downwardly into or around said springs, said upholstery fabric being relatively slack as compared to said spring-loading fabric members.

---



2,771,130
**EMERGENCY FUEL CONTROL SYSTEM**
Stanley G. Best, Jr., Manchester, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application December 30, 1952, Serial No. 328,767
16 Claims. (Cl. 158—36.3)

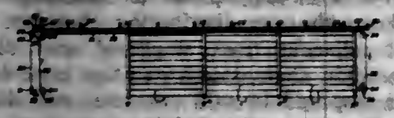
1. In combination, a power plant having a combustion chamber, a source of fuel under pressure, a throttle valve operatively connected between said source and said combustion chamber, said valve being resiliently biased toward a closed position, at least one other valve operatively connected in parallel with said throttle valve, means for metering the amount of flow to said other valve, means for maintaining the pressure drop across said metering means at a constant, and means for varying the opening of said other valve thereby varying the pressure on the downstream side of said throttle valve and automatically modifying the effect of the resilient bias and varying the opening of said throttle valve.

---

2,771,131
**BURNERS FOR GAS FIRED BOILERS**
Charles Howard Hoak and Wallace W. Miller, Pittsburgh, Pa.
Original application November 4, 1948, Serial No. 58,242. Divided and this application March 29, 1951, Serial No. 218,286
1 Claim. (Cl. 158—114)

A burner for gas-fired furnaces of the type having rows of boiler tubes spaced immediately above the burner structure comprising burner heads of a plurality of parallel duct sections with air spaces therebetween and constituting an integral casting, said sections being connected by a cross web having an inlet neck portion centrally of the ends and sides thereof forming a gas inlet and distributing chamber communicating with said ducts, a venturi tube adapted to lead fuel from a gas manifold and connected to said inlet neck portion at the other end thereof, each of said burner ducts having pairs of rows of closely spaced jet openings except in the area above the gas distributing chamber with the openings of adjacent rows staggered and divergently inclined at a slight angle, said area being imperforate and baffle plates disposed in said gas inlet and distributing chamber, said plates substantially extending from the center duct to the outer walls of the outside ducts of the burner heads.

2,771,132
RADIANT GAS BURNER APPARATUS
Homer D. Du Pont, Easthampton, Mass.
Application May 25, 1953, Serial No. 357,688
2 Claims. (Cl. 158—113)

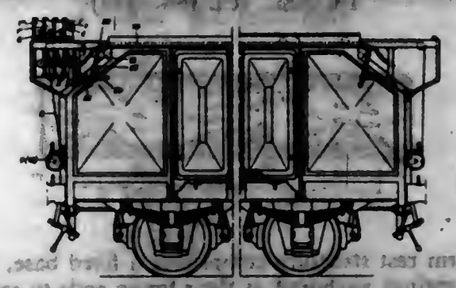


1. Gas burner apparatus comprising in combination, an elongated horizontal base plate provided with an elongated opening having opposite and adjacent sides and ends, a burner secured to said base plate having sides and ends spaced inwardly from the sides and ends respectively of said opening, elongated shelf members having lower portions secured to said base plate along opposite sides of the opening therein and extending upwardly from said base plate, elongated supporting shelves on upper portions of said shelf members disposed above the plane of the upper side of said burner and base plate, and an elongated dome member formed from ceramic material to have a transversely convexed wall between and above said shelf members and provided with opposite transversely spaced longitudinal lower edges disposed on said supporting shelves, said wall of the dome, shelf members and upper side of the burner cooperating to form an elongated open ended horizontally disposed combustion chamber therebetween, said wall of the dome provided with transversely spaced rows of longitudinally spaced openings and the upper side of said burner provided with upwardly directed gas ports.

2,771,133
WINDOW
Alden H. Haskell, Lexington, Ky.
Application September 25, 1953, Serial No. 382,363
3 Claims. (Cl. 160—99)

1. A window comprising a frame mounted in a building wall, a pair of window panels in said frame, hinge means pivotally interconnecting adjacent edges of said panels, centrally operated spring loaded latch means for adjustably positioning the remote edges of said panels on said frame, a removable storm window member secured to the outer surface of each panel in spaced sealed relation, and a removable awning member secured to one of said panels for protection from direct sun rays, said storm window members and awning member being accessible from the interior of a building in which the frame is mounted.

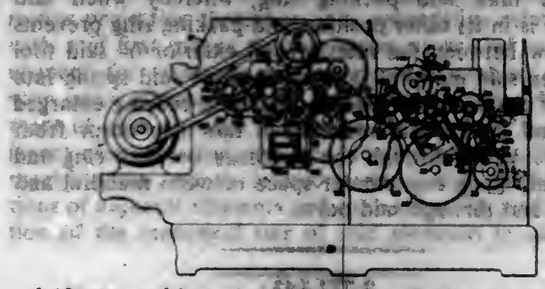
2,771,134
BLIND FOR STRAIGHT OPENINGS
Francisco Jose Lattanzio Baroni, Buenos Aires, Argentina
Application June 28, 1954, Serial No. 439,823
3 Claims. (Cl. 160—115)



1. A blind for a window and the like having a straight opening, the blind being formed from a plurality of interconnected horizontal slats, a plurality of vertical supporting members suspended from the top of the window opening, the slats being pivotally connected to the vertical supporting members, the vertical supporting members being slidably mounted, means for sliding the vertical supporting members and the slats horizontally across the window opening to vary the width of the blind, and means for pivotally and manually turning the slats to vary the inclination of the slats and the openings between successive slats.

2,771,135
VENETIAN BLIND
Brooks Walker, Piedmont, Calif.
Application June 6, 1955, Serial No. 513,219
5 Claims. (Cl. 160—168)

1. A Venetian blind, including a rotating tilt rod, a tilt cord lock, tilt cords, ladder tapes, slats, lift cord turns, fascia slats, said fascia slats being supported one at each side of said tilt rod, supporting brackets, each said fascia slat hanging from at least one said bracket, said bracket being supported from said tilt rod, said tilt rod being free to rotate inside said bracket while said bracket supports said fascia slats, said fascia slats being free to rotate independently relative to each other for a substantial angle of swing about said tilt rod.



2,771,136
HATCH-COVER
Claude Lecomte, Fontenay Aux Roses, France, assignor to International Mac Gregor Organization (I. M. G. O.), Casablanca, Morocco, a corporation of Morocco
Application March 28, 1955, Serial No. 497,330
Claims priority, application France July 21, 1954
9 Claims. (Cl. 160—189)

1. A closing arrangement for a railway truck or the like comprising back, front and side walls said walls forming together an opening, an open guiding surface on the upper portion of said side walls flanking said opening, at least one series of longitudinally aligned movable panels, lateral roller means on said panels freely resting and rolling on said guiding surface in order to easure a longitudinal displacement of said panels to open or close the truck, rigid link means for pivotally interconnecting two longitudinally adjacent panels, a stowage space at least at one of the ends of said space located substantially adjacent the respective back or front side, adapted to contain the different panels arranged side by side and in an upended position, inclined guideway portions extending inside said stowage space and constituting an extension of said guiding surface on which said roller means are adapted to move, further guiding means parallel with said inclined guideway portion but somewhat offset with respect thereto extending along the stowage space, lateral protrusions provided on each of said panels for positive cooperation with said further guiding means, the combined action of said protrusions along the said further guiding means together with the rolling of said rollers on said inclined guideway portions causing each panel to be tilted to and from the vertical upended position they occupy in said stowage space, pulling means connected to the panel which is the farthest from the stowage space and winding control means acting on said pulling means for causing them to move the said farthest panel in both directions, thereby either closing the said space and spreading thereupon a complete sheet of adjacent panels or opening the said space and causing the said panels to be located in the upended position in said stowage space.

2,771,137
RECORD CONTROLLED PUNCH WITH PROVISION FOR SERIAL NUMBERING
Paul V. Babel, Vestal, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application April 30, 1953, Serial No. 352,267
7 Claims. (Cl. 164—115)

1. In a machine of the class described, means to feed a succession of records having designations representing the quantity of separate records to be serially number punched, means to sense said designations one record at a time, a quantity counter, a serial number counter, means to enter a unit in each of said counters for each of said separate records, means controlled by the feeding of one of said first named records to cause resetting of said quantity counter, means controlled by the sensing means for entering the quantity in the quantity counter when one of said first records is sensed, a record perforating mechanism, a cyclically operable emitter, means for initially placing said perforating mechanism under control of said emitter to punch the first of said separate records with a predetermined intial serial number, means for setting said serial number counter one unit higher than said initial number, means for thereafter placing said perforating mechanism under control of said serial number counter to serial number punch a succession of said separate records beginning with the next higher serial number above said initial number, and means controlled by the quantity counter when the last record of said separate series is serial number perforated to render the feeding means effective to feed another of the first named records to the sensing means.

2,771,138
WATERFLOODING METHOD OF SECONDARY RECOVERY
Donald M. Bossen, Tulsa, Okla., assignor to Esso Research and Engineering Company, a corporation of Delaware
No Drawing. Application June 13, 1955, Serial No. 515,264
9 Claims. (Cl. 166—9)

1. A method of recovering oil from a subterranean oil reservoir which comprises injecting an aqueous solution within the reservoir, the aqueous solution containing dissolved sugar and a water-soluble salt of a metal selected from the class consisting of aluminum, lithium and beryllium, the amounts of sugar and salt within the solution being sufficient to provide the solution with a viscosity of from 0.1 to one times the viscosity of the oil but less than 500 centipoises, the amount of the aqueous solution injected constituting from about 0.05 to 0.5 the volume of hydrocarbon within the reservoir, thereafter injecting water into the reservoir so as to drive the aqueous solution through the reservoir in the form of a bank, and withdrawing fluids including oil from the reservoir at a point removed from the point of injection.

2,771,139
MULTIPLE SOLVENT SECONDARY RECOVERY PROCESS
Edward F. Johnson and George G. Binder, Jr., Tulsa, Okla., assignors to Esso Research and Engineering Company, a corporation of Delaware
No Drawing. Application July 22, 1953, Serial No. 369,706
5 Claims. (Cl. 166—9)

1. A secondary recovery process for recovering oil from an underground oil reservoir which is in communication with an injection well and a producing well which comprises injecting a first oil solvent down the injection well and into the oil reservoir, said first solvent being a hydrocarbon containing from 3 to 5 carbon atoms, thereafter injecting a second oil solvent down the injection well and into the reservoir, said second solvent also being a hydrocarbon containing from 3 to 5 carbon atoms; the combined amounts of the two solvents being greater than 15 percent by volume of the hydrocarbon pore volume of the reservoir and the second solvent being more volatile than the first solvent, maintaining the pressure of the reservoir at a value greater than the vapor pressures which the solvents normally possess under the conditions that prevail within the reservoir, thereafter injecting a drive gas down the injection well into the oil reservoir, said gas being non-condensible under the conditions that prevail within the reservoir, and removing from the reservoir through the producing well oil that is swept from the reservoir.

2,771,140
SUBSURFACE IGNITER
Harry A. Barclay, Dallas, Tex., and Dean P. Nichols, Comanche, Okla., assignors, by mesne assignments, to Socony Mobil Oil Company, Inc., a corporation of New York
Application August 28, 1953, Serial No. 377,155
9 Claims. (Cl. 166—60)

1. In an apparatus for supplying heat to a subterranean formation adjacent a bore hole, the combination which comprises a plurality of spiral heating elements oriented in an end-to-end array to form an elongated heating unit, supporting structure for said plurality of elements including three metallic rods electrically insulated one from the other and spaced uniformly around the periphery of a circle within and smaller than the dimension

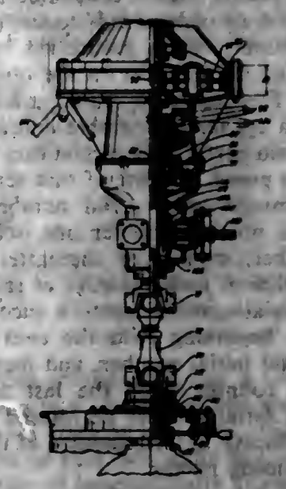
of said spiral heating elements, and electrical connections between the two extremities of each of said heating elements and selected pairs of said rods.

---

2,771,141
JET WALL CLEANER
Farral Francis Lewis, Shreveport, La., assignor of one-half to Gem Oil Tool Company, Inc., Lafayette, La., a corporation of Louisiana
Application September 3, 1953, Serial No. 378,332
6 Claims. (Cl. 166—222)

1. In a well tubing tool for jetting a high velocity fluid stream from within the well tubing and in a swirling path over the side wall of a well bore in which the tubing may be fitted, a tube section having a series of circumferentially spaced external bosses which terminate at their upper ends in upwardly facing shoulders projecting outwardly of the tube section wall and a pressure fluid jetting passage extending upwardly through each boss from the tube section interior and terminating in an upwardly directed discharge mouth in the upwardly facing shoulder of the boss and said passage extending on an axis which lies in a plane parallel to a longitudinal plane containing the axis of the tube section and is outwardly divergently related to the longitudinal extent of the tube section wall.

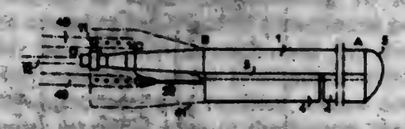
---



2,771,142
TUBING DRAINS
Oliver Charles Sloan, Odessa, and Joe Webb Gibbs, Houston, Tex.
Application March 18, 1953, Serial No. 343,212
6 Claims. (Cl. 166—226)

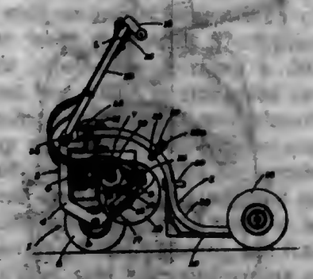
1. A pressure equalizing tool adapted for placing in a string of tubing for use in a well, which comprises a tubular body, a bottom sub attached to one end thereof and having thread connections for attachment of the tool into a tubing string, a top sub attached to the other end of said body, a tubular mandrel slidably extending into said body through said top sub and having thread connections at the free end thereof for attachment of the tool into a tubing string, said mandrel being of sufficiently smaller external diameter than the smallest internal diameter of said body through which it moves axially as to allow clearance for fluid flow between mandrel and body, an enlarged bottom end of said mandrel within said body having an upper circular shoulder, said body having within its upper end a corresponding circular internal shoulder adapted for engagement with said shoulder on said enlarged end of said mandrel to limit outward motion of said mandrel, a helical compression spring within said body secured at its bottom by said bottom sub and pressing against the bottom of said enlarged bottom end of mandrel biasing said mandrel towards its outermost position, at least one drain port in said body between said internal shoulder and said top sub, at least one packing ring around said enlarged bottom end of said mandrel making a seal by contact with the inner circumference of said body below the aforesaid shoulders, and a cylindrical recess within the bottom portion of said body longer than the enlarged bottom end of said mandrel and of greater diameter than said packing ring, whereby when said mandrel is in its outer position said packing ring prevents fluid flow between the interior and exterior of said tool and when said mandrel is forced against said spring into its inner position with said packing-ring-bearing enlarged lower end within said recess fluid flow can occur from within said tool through the clearance between ring and recess and along the annular space between mandrel and body to and through said ports.

---



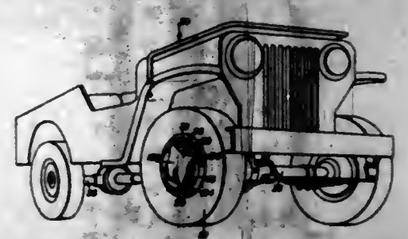
2,771,143
TRANSMISSION SYSTEM FOR ROTATING WING AIRCRAFT
Harris S. Campbell, Bryn Athyn, Pa.
Application March 29, 1948, Serial No. 17,707
10 Claims. (Cl. 170—135.22)

6. A helicopter transmission system having a two speed unit, an input shaft thereto, an output shaft therefrom, a freewheel device in said input shaft, a gear reduction mechanism incorporated in said two speed unit, a one way reaction device in the gear reduction mechanism, a tail rotor drive geared to the input shaft between said freewheel device and said gear reduction mechanism and an automatically engageable mechanism located between said output shaft and said tail rotor drive to operate the tail rotor drive when power is removed from said input shaft.



2,771,144
BLADES FOR ROTARY-WING AIRCRAFT
Gaston M. Lalouette, Boulogne-sur-Seine, André H. Laville, Puteaux, and Paul H. L. Morain, Paris, France, assignors to Société Nationale de Constructions Aeronautiques du Sud-Ouest (Société Anonyme), Paris, France, a company of France
Application October 28, 1952, Serial No. 317,366
Claims priority, application France December 28, 1951
3 Claims. (Cl. 170—159)

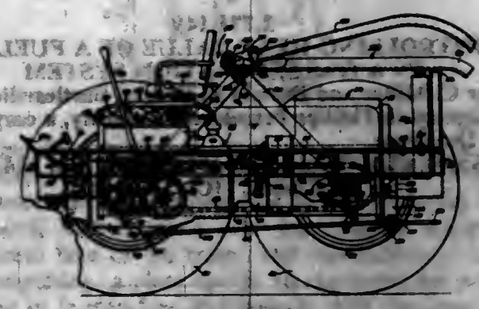
1. A propeller or sustaining rotor blade assembly for aircraft comprising a tubular metal spar member adapted to define a leading edge of the blade and having longitudinally extending first means projecting therefrom towards the rear edge of the blade, a trailing edge structure adapted to complete the airfoil contour of the blade and consisting of a plurality of separate elements, a profiled section attached to the leading side of each of said elements and having second longitudinally extending means projecting therefrom into cooperative relationship with said first means, keying means associated with said element for retaining said elements assembled to said spar while allowing limited independent sliding displacement of each element relative to the spar and to the adjacent elements, and separate traction-resisting displacement-limiting means interconnecting said profiled sections of adjacent elements and connecting the profiled section of the innermost one of said elements to said hub.



---

2,771,145
FOLDABLE THREE-WHEEL POWER DRIVEN VEHICLE
Byron M. Polen, Ladera, Calif.
Application August 30, 1954, Serial No. 453,005
4 Claims. (Cl. 180—26)

1. A self-propelled vehicle comprising a front power unit which includes a central ground-engaging drive wheel, a trailer behind the power unit and having a pair of transversely spaced ground engaging wheels symmetrically disposed relative to the first named wheel when the power unit and trailer are longitudinally alined, means on the trailer to support a driver, means connecting the trailer and power unit for relative rotation about a vertical axis, and a steering handle structure on the power unit arranged for actuation by the driver; said connection means comprising a vertical socket on the power unit and a pin on the front end of the trailer detachably seated in the socket and then maintaining the trailer and power unit in cooperating relationship; and another pin fixed on the trailer and engageable in said socket when the first named pin is withdrawn therefrom, said other pin being positioned so that when engaged in the socket, the trailer will be disposed alongside and close to the power unit with the axial line of the trailer wheels extending lengthwise of the power unit.



2,771,146
SAFETY DEVICE FOR FOUR WHEEL DRIVE VEHICLES HAVING FRONT AND REAR AXLE DIFFERENTIALS
Salvatore Fago, Madera, Calif.
Application October 7, 1952, Serial No. 313,397
6 Claims. (Cl. 180—44)

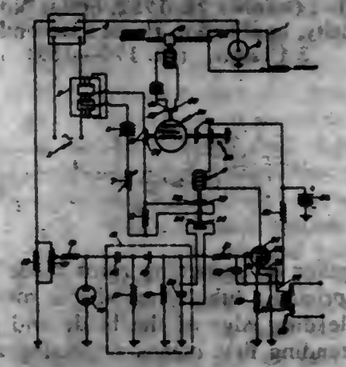
1. A vehicle including front and rear wheel assemblies, each of said wheel assemblies including differential gearing assemblies drivingly connected to respective front and rear axle assemblies through impeller shafts drivingly connected to a common power source, and a safety device operably connected to a wheel and driving axle of one of said wheel assemblies providing an over-load torque relieving means between the power source, differential gearing assemblies and axle assemblies, said safety device including a slipping over-load release coupling, said coupling being operatively interposed between said wheel and its driving axle, said wheel being maintained in fixed axial position with respect to said driving axle.

---

2,771,147
FOUR-WHEEL DRIVEN TRACTOR
Charles S. Ash, Detroit, Mich.
Application May 18, 1950, Serial No. 162,617
2 Claims. (Cl. 180—49)

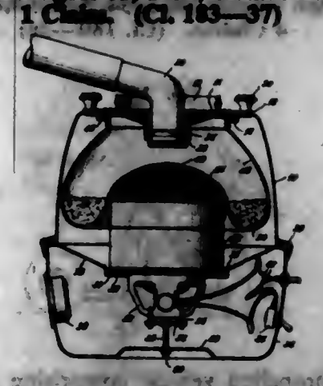
1. A self-propelled wheeled tractor vehicle comprising a main frame structure, a hollow forward wheel support mounted forwardly on said main frame structure, a rearward wheel support mounted rearwardly on said main frame structure in longitudinally-spaced relationship with said hollow forward wheel support, a wheel hub loosely and rotatably mounted on each end of each wheel support, ground-engaging wheels mounted on said hubs, an axle rotatably mounted in said hollow wheel support and drivingly connected at its outer ends to the wheel hubs mounted thereon, an engine mounted rearwardly on said frame structure, power-transmitting mechanism extending forwardly from said engine to said axle and drivingly connecting said engine to said axle, toothed driving members mounted on and fixedly secured to said hubs, and a plurality of endless flexible driving elements, each element extending between and engaging the corresponding longitudinally-spaced driving members secured to the associated hubs.

2,771,148
**INSTRUMENT PANEL FOR MOTOR VEHICLES**
Friedrich K. H. Nallinger, Stuttgart, Germany, assignor to Daimler-Benz Aktiengesellschaft, Stuttgart-Untertürkheim, Germany
Application September 4, 1952, Serial No. 307,789
Claims priority, application Germany September 8, 1951
3 Claims. (Cl. 188—90)



1. An instrument panel for motor vehicles comprising a panel provided with a window, a pane closing said window, a supporting plate, a frame fixed to said panel and surrounding said supporting plate over the edge thereof on the side of said supporting plate opposite said panel, a strip of sound-absorbing material interposed between said frame and the marginal zone of said plate, a spacing element of resilient material coextensive with the periphery of said plate and inserted between the marginal zone thereof and said panel to keep said plate spaced from said panel and sealing the space therebetween, and instruments carried by said plate behind said pane being visible therethrough.

2,771,149
**CONTROLLING HEAT VALUE OF A FUEL GAS IN A GAS SEPARATION SYSTEM**
Elmer C. Miller and Donald E. Berger, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Application October 13, 1952, Serial No. 314,464
12 Claims. (Cl. 183—2)

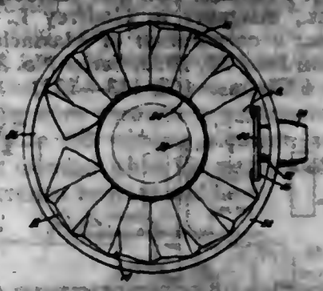


1. A process for separating from a stream of natural gas comprising a mixture of normally gaseous paraffins a gaseous product stream consisting essentially of a mixture of at least three normally gaseous paraffins and containing a larger proportion of paraffins of low molecular weight than said natural gas stream, which comprises passing a feed stream of such natural gas to a separating means and separating from said natural gas feed stream such a gaseous product stream, measuring the refractive index of said product stream, and controlling the operation of said separating means with respect to the proportion of paraffins of higher molecular weight in said product stream to maintain said measured refractive index constant, whereby the heating value of said product stream is maintained constant.

2,771,150
**PROTECTIVE RELAY CIRCUITS**
Jeremy Wells, Waltham, Mass., assignor, by mesne assignments, to AFRA Electronics Corporation, New York, N. Y., a corporation of Delaware
Application July 22, 1954, Serial No. 445,092
2 Claims. (Cl. 183—7)

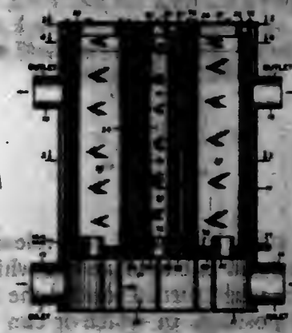
1. In a gas cleaning system, means for ionizing a gaseous medium to be cleaned, a source of input voltage for said ionizing means, integrating means adapted to register the frequency of current pulses which may occur in said ionizing means, first switching means controlled by said integrating means and adapted to operate when said current pulses exceed a predetermined frequency, means in circuit with said input voltage source and adapted to reduce said input voltage when said first switching means function, washing means connected to said ionizing means, and second switching means adapted to sequentially remove said input voltage from said ionizing means, actuate said washing means, and restore said first switching means to its pre-functioning condition.

2,771,151
**VACUUM CLEANER**
Ralph C. Osborn, Bloomington, Ill.
Application August 11, 1953, Serial No. 373,541
1 Claim. (Cl. 183—37)



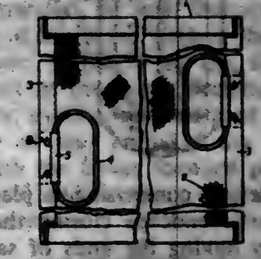
A device of the character described comprising an upstanding wall provided with a top having an inlet opening disposed centrally thereof and provided with an annular bottom wall presenting an outlet opening in register with the inlet opening, an imperforate, open ended cylindrical fan housing extending axially upwardly from the inner marginal edge portion of said bottom wall defining the outlet opening therein with the outer surface of said housing being spaced inwardly from the inner surface of said upstanding wall, a fan mounted within said housing for discharging air through said outlet to create a subatmospheric pressure within the chamber defined by said top, bottom and upstanding walls, a generally hemispherical member having its marginal edge secured to the open upper end of said fan housing, said member being effectively foraminous only throughout the portion thereof extending above the open upper end of the fan housing, a porous cleaner bag positioned within said chamber with the central portion of the bottom thereof resting upon

and covering said foraminous member and with the remainder of the bottom of the bag extending below the open upper edge of the fan housing and below the said effective foraminous portion to encompass a substantial portion of the upper end of the fan housing, and the neck of the bag being secured in depending relation from said top wall of the chamber whereby that portion of the bag which encompasses the upper end of the imperforate fan housing forms an annular dust collecting space, and an inlet fitting projecting through said inlet opening and directed downwardly to discharge incoming air toward and through the center of the effective foraminous portion of said member and axially through said fan housing whereby the dust collecting space is disposed within an area of relative quiescence, and resilient means disposed between said inner marginal edge of the bottom wall and said fan housing, whereby vibrations of said fan will be transmitted from the fan housing to said foraminous member to shake said collecting bag and deposit accumulated dirt within said annular dust collecting space.



2,771,152
**SUCTION CLEANER AND DISPOSABLE DUST BAG THEREFOR**
George H. Bramhall, Chagrin Falls, and Warren N. Kemnitz, Willoughby, Ohio, assignors to General Electric Company, a corporation of New York
Application February 18, 1954, Serial No. 411,056
9 Claims. (Cl. 183—37)

1. A suction cleaner comprising a casing, an air flow producing means, an annular filtering chamber, a removable end wall on said casing which exposes the annular chamber when removed, a coupling member on said casing for removably securing a dust bag in said chamber, a dust bag which is elongated and substantially flat prior to being positioned in said chamber, said member comprising a trackway having an entrance portion facing said removable end wall for receiving a portion of said bag, said dust bag being adapted to be positioned in said chamber when said end wall is removed by inserting said portion of said bag into said trackway through it entrance portion, said bag conforming to the shape of said chamber when positioned therein.

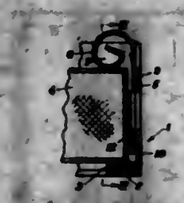


2,771,153
**FILTER APPARATUS**
Ralph R. Heath, New York, N. Y., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York
Application April 29, 1948, Serial No. 502,595
6 Claims. (Cl. 183—46)

1. Apparatus for separating entrained liquid particles from a gas stream containing the same, said apparatus comprising a casing formed of gas impermeable material and having side walls, a bottom wall, and a top wall having an opening therein; an open-bottomed filter unit comprising top and side walls adapted to form an interiorly disposed gas chamber, said top being gas impermeable and at least a portion of said unit walls being permeable to gas and substantially impermeable to liquid particles, said unit having (a) cross-sectional dimensions less than those of said casing and of said casing top wall opening whereby said unit is readily insertable in and removable from said casing and is adapted to form with the interior walls thereof a peripherally disposed gas chamber and (b) longitudinal dimensions sufficient so that the lower periphery of said unit side walls and said casing bottom are adapted to be maintained in substantially contiguous but non-fixed relation, means for attaching the top of

said unit to said casing top in gas-tight relation, means for forming a liquid gas-seal, comprising liquid particles coalesced and collected during operation, between said casing bottom and the lower periphery of said unit side walls, a gas conduit through said casing communicating with said interior gas chamber, and a gas conduit through said casing communicating with said peripheral gas chamber.

2,771,154
**FILTER FRAME HANDLE CONSTRUCTION**
Dan J. Gonzalez, Louisville, Ky., assignor to American Air Filter Company, Inc., Louisville, Ky., a corporation of Delaware
Application September 12, 1952, Serial No. 309,342
6 Claims. (Cl. 183—49)



1. A handle retaining structure for an open-faced filter frame having perimetric walls and face flanges to retain a filter medium, at least one face flange extending from a perimetric wall laterally over the adjacent margin of the adjacent face of the frame and terminating in a free edge, comprising: a plate having an apertured flat portion extending in face-to-face engagement with the inner face of said one face flange and a handle carrying portion projecting laterally therefrom beyond the free edge of said one face flange; and a tab in said face flange, turned inwardly into the aperture of said plate, an edge of said inturned tab providing a cam engaging an edge of said aperture and, through such engagement, urging said plate laterally along the underside of said face flange in the direction of the adjacent perimetric wall.

2,771,155
**UNIT FILTER LATCH**
Robert A. Palmore, Louisville, Ky., assignor to American Air Filter Company, Inc., Louisville, Ky., a corporation of Delaware
Application December 14, 1953, Serial No. 397,981
7 Claims. (Cl. 183—49)

6. An article of manufacture comprising: an auxiliary frame having a front opening to receive a filter cell and a rear sealing flange; a latch arm having a stem and a laterally extending resilient head; and means pivotally

mounting the stem on the frame between the side wall of the frame and the adjacent cell receiving space for twisting movement about the long axis of the stem from a latching position in which the head extends over the cell receiving space to a cell releasing position in which the head extends at least partially into the space between the side wall in which it is mounted and the cell receiving space; said resilient head being outwardly springable

relatively to the stem from said cell releasing position, toward which the head is biased and in which if can not clear the cell space when turned toward the latching position, to an outer position, in which it can clear and be moved over the cell space, said head being operable, when moved over the cell space and released, to engage a front margin of the cell in the cell space and urge the cell rearwardly into engagement with the sealing flange.

---

2,771,156

**FILTER**

Walter Kasten and Abbett M. Rohn, Detroit, Mich., assignors to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware

Application October 22, 1953, Serial No. 387,734
3 Claims. (Cl. 183—71)

1. A filtering device comprising a pleated filter element, resilient plastic endcaps closing the ends of said pleated element by having the ends of said filter pleats embedded therein, and a groove formed in the outer face of each of said endcaps, said groove having two side walls, said walls extending substantially the same distance from the bottom of the groove to a common plane.

---

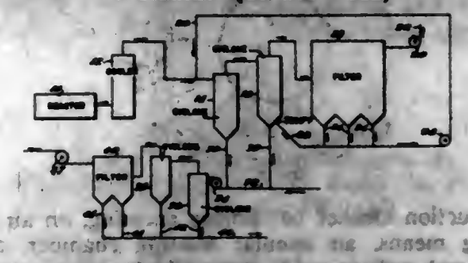
2,771,157

**METHOD OF CONVERTING KINETIC ENERGY TO PRESSURE ENERGY AND A DEVICE FOR CARRYING OUT THE METHOD**

Karl Axel Göran Gustavsson, Enköping, Sweden, assignor to Aktiebolaget E. A. Hjorth & Co., Stockholm, Sweden, a corporation of Sweden

Application May 26, 1953, Serial No. 357,491
Claims priority, application Sweden July 11, 1952
4 Claims. (Cl. 183—83)

1. In a device for converting kinetic energy present in a whirl formed by an inwardly spiralling fluid flow into pressure energy, in which said whirl is formed in a housing including a chamber, said device comprising a discharge duct for the fluid centrally disposed within said chamber and said whirl, said discharge duct including a throat portion at the inlet end thereof and a diffuser portion at the outlet end thereof a plurality of deflection blades curved in one plane and mounted in said discharge duct in circumferential spacing, the leading edge of said blades forming a convex curve in the direction of the fluid flow and having an inlet angle conforming to the axial and tangential resultant of the fluid flow along the entire radius of rotation within the whirl whereby the blades deflect fluid spiralling into said duct approximately perpendicular to the general plane of said fluid whirl and the angle of impingement of the fluid flow upon the blades is about 0 at each point of the leading edge of the blades, said blades and said throat being disposed in a spatial relationship such as to form channels between adjacent blades having a cross-sectional area remaining substantially uniform perpendicular to the middle line of the curvature of said channels along the entire deflecting part of said blades, said diffuser portion communicating with the outlet side of said throat for reducing the velocity of the fluid flow thereby converting the kinetic energy of the fluid flow into pressure energy after the deflection of the fluid flow.



---

2,771,158

**RECOVERY OF PIGMENTS FROM AEROSOLS**

Richard L. Bray, Franklin, La., and Randolph Antonsen, Boston, Mass., assignors to Godfrey L. Cabot, Inc., Boston, Mass., a corporation of Massachusetts

Application June 30, 1953, Serial No. 365,020
6 Claims. (Cl. 183—122)

1. A process for recovering finely-divided solids from aerosols comprising the steps of flowing the aerosol through a series of cyclonic separation zones, thereby separating in each zone a portion of the solids content of the aerosol, separating the attenuated aerosol leaving the last of the series of cyclonic separation zones into portions of unequal volume, conducting the portion of larger volume to a filtration zone and taking up the solids discharge of the filtration zone in the smaller volume portion of the aerosol, separating substantially all of the remaining solids from the aerosol in the filtration zone and discharging the separated solids into the aerosol stream thereby increasing the solids content of said aerosol, conducting the aerosol thus loaded to the first of the series of cyclonic separation zones, thereby increasing the grain loading of the aerosol being treated, and recovering the solids separated therein from the cyclonic separation zones.

---

2,771,159

**MOTOR-SPRING WINDING MECHANISM**

Ernest Meef, La Chaux-de-Fonds, Switzerland

Application February 9, 1955, Serial No. 487,134
Claims priority, application Switzerland January 5, 1955
8 Claims. (Cl. 185—39)

1. In an apparatus the combination of: a rotatable driven element having a sleeve coaxial to its axis of rotation; a rotatable winding element having a sleeve coaxial to its axis of rotation; a cylindrical coil-spring having its ends encompassing each one of said sleeves so as to exert a torque on said driven element upon a rotation of said winding element in the winding direction corresponding to that in which the turns of said coil-spring are coiled up; a flexible core fixed at one end to said driven element and extending within the turns of said coil-spring throughout the whole spring for preventing overlapping and entangling of said turns, the other end of said core passing freely through said winding element; means for preventing said winding element from rotating in the direction opposite to the winding direction; and a mechanism for driving said winding element in the winding direction, thereby increasing the number of turns of the coil-spring until first said turns come in contact with one another and then the coil-spring becomes longer thus displacing the free end of said core axially relative to said winding ele-

ment, said winding mechanism comprising: a member mounted for rotation, spring means urging said member in one direction, power means for driving said member in the other direction, against the action of said spring means, transmitting means connecting said member to said winding element and so arranged that this member drives said element in the winding direction when said member is actuated by said power means, latching means controlled by said core for locking said member when the number of turns of said coil-spring increases beyond such a limit that said spring has already displaced said free end of the core through a predetermined distance axially relative to the winding element, and means for unlocking said member when the number of turns of said coil-spring decreases beneath said limit.

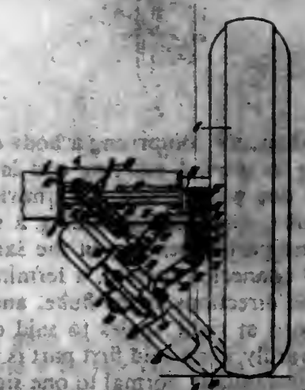
2,771,160

**MEANS FOR DISTRIBUTING ELEVATOR SERVICE ACCORDING TO DEMAND**

Joseph H. Borden, Toledo, Ohio, and Edward F. Vlasak, Long Island City, N. Y., assignors to Haughton Elevator Company, Toledo, Ohio, a corporation of Ohio

Application February 19, 1954, Serial No. 411,434
17 Claims. (Cl. 187—29)

17. In a floor call system for a group of elevators, in combination, means for registering floor calls, floor selecting machines one driven by each elevator, means on said machines cooperating with said call storing means for canceling stored calls as they are answered, timers operatively connected to the storing means corresponding to floors to receive preferential service for timing the interval that a call is stored, a stopping circuit for each elevator including a bank of contacts on the corresponding floor selecting machine, circuits including contacts of said call storing means for energizing contacts of said bank of contacts, a relay, contacts operated by the relay for opening the stopping circuits for floors higher than the preferred floors, and timers connected to the storing means for said higher floors, said timers having contacts to reestablish the stopping circuits for said higher floors.



---

2,771,161

**ANTI-SKID APPARATUS**

John Jesionowski, Schenectady, N. Y.

Application December 13, 1954, Serial No. 474,711
3 Claims. (Cl. 188—4)

1. The combination with a vehicle chassis having a pneumatic tired road wheel of anti-skid apparatus for said tire comprising, a carrier having an anti-skid wheel rotatable thereon provided with a pneumatic anti-skid tire, pivotal connections and other pivotal and yieldable connections between said carrier and chassis swingably mounting said carrier on said chassis for movements of the carrier between inner inoperative and outer operative anti-skid position, said connections constructed and arranged to position the axis of the anti-skid wheel in a vertical plane parallel to and forwardly of a vertical plane extending through the axis of the road wheel and position the inner periphery of the anti-skid tire in a plane above that of the outer periphery thereof in all positions of the carrier and adapted to position said outer periphery of said anti-skid tire in wedging anti-skid relation with the lower forward portion of the tire of the road wheel and roadway thereunder in operative position of the carrier.

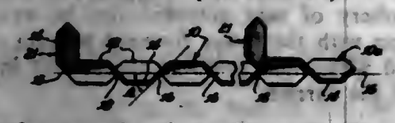
---

2,771,162

**ADJUSTABLE WHEEL CHOCK**

John C. Marsh, Willow Grove, Pa., assignor to Eastern Rotorcraft Corporation, Neshaminy, Pa., a corporation of Pennsylvania

Application April 14, 1952, Serial No. 282,189
3 Claims. (Cl. 188—32)



1. An adjustable wheel chock having two wheel engaging members, a frame, the end of one of said members being attached to said frame to extend from one side thereof, a sliding element supported on said frame, said element being attached to the end of the second wheel engaging member on the same side of said frame as the first member, a latch mechanism attached to said element including a plunger cylinder, a plunger having a part projecting from the wall thereof, said plunger being supported in said cylinder, a cylindrical cap proportioned to fit over the upper end of said plunger, a helical spring reacting between said cap and said projecting part to apply a spring load to said plunger, and a swingable rod support to hold said cap in position against the spring force.

2,771,163
GROUND ANCHORS
Guy Mafera, Jr., Westwood, Mass.
Application August 26, 1954, Serial No. 452,297
2 Claims. (Cl. 189—31)

1. A ground anchor comprising a body of right angular section having its ground entering end in the form of a point, at least one wall of said body having a transverse slot, and a fluke, said fluke including a supporting arm including a first part, extending in the same direction as said fluke and connected thereto, a terminal part extending in the same directions as the fluke, and an intermediate part disposed at right angles to said other parts and extending upwardly when said first part is in said slot and said fluke is substantially normal to one side of said body, the length of said first part being such that when said fluke is in said position said intermediate part is parallel with and in contact with the other side of said stake, and the length of said intermediate part being such that when the fluke is parallel with and in contact with said one side of said stake the terminal part is parallel with and in contact with said other side of said stake.

2,771,164
WALL CONSTRUCTION
James C. Scurlock, Los Angeles, Calif., assignor to Western Engineering Associates, Los Angeles, Calif., a limited partnership
Application January 27, 1949, Serial No. 73,147
8 Claims. (Cl. 189—34)

1. A surface member for wall construction comprising a relatively dense thin rigid sheet member provided over an extended area with a plurality of hollow polyhedral indentations extending in opposite directions from a medial surface of said sheet member, said indentations comprising one group of similarly oriented congruent indentations having polygonal outer wall portions located in uniformly spaced relation to and at one side of such medial surface and a second group of similarly oriented congruent indentations having polygonal outer wall portions located in uniformly spaced relation to and at the other side of such medial surface, each indentation having a plurality of inclined substantially planar side wall portions extending divergently from the respective sides of its outer wall portion to said medial surface and each such inclined side wall portion of each indentation of one group being coplanar with a similar side wall portion of an adjacent indentation of the other group to define a substantially flat plane extending between polygonal outer wall portions of adjacent oppositely oriented indentations, and side wall portions of a set of adjacent indentations of each group meeting at a common point substantially at said medial surface, the inclined side wall portions of said indentations intersecting said medial surface along a plurality of straight lines about which the sheet has a minimum resistance to bending, and a reinforcing flange extending transversely to said medial surface and attached to the indented area of the sheet along one of said lines, whereby the sheet is reinforced against bending about any of said lines intersecting said reinforcing flange and is stiffened for a substantial distance away from the reinforcing flange.

2,771,165
SECURING STRIP
Elva L. Bell, Spokane, Wash.
Application September 29, 1952, Serial No. 312,037
2 Claims. (Cl. 189—76)

2. A corner construction for angularly meeting sections of securing strip having front and rear transversely diverging leaves shaped to define jaws at its free edges comprising mitered cooperating ends formed on said front leaf of each said section, said rear leaf being folded longitudinally in covering relation with said front leaf and having a cutaway portion adapted to receive the jaw of said front leaf, and said rear leaf folded portion being spaced from the balance of said rear leaf to form a socket to slidably receive the free end of the cooperating section.

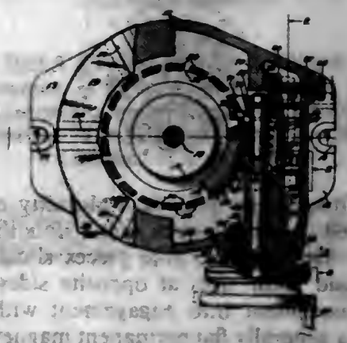
2,771,166
HANDLES FOR BRIEF CASES AND LUGGAGE
Lewis Lifton, New York, N. Y.
Application August 2, 1954, Serial No. 447,174
16 Claims. (Cl. 190—57)

1. As a new article of manufacture for a handle, comprising a one piece substantially ring shaped member embodying a pair of spaced ring sections adapted to be shifted towards each other and having spaced exteriorly convex surfaces and spaced internally concaved surfaces, spaced web means intermediate said sections and integral therewith, bridge means integral with and extending laterally from the upper margin of one of said sections and outside the latter and adapted to be turned adjacent the confluence of said bridge means and said upper margin within and transversely of said last mentioned section, said last mentioned section having means for holding said bridge means within and transversely of said last mentioned section, and said bridge means and the other section of said pair having cooperating means to hold said sections closed and in juxtaposition.

2,771,167
HANDLES FOR BRIEF CASES AND LUGGAGE
Lewis Lifton, New York, N. Y.
Application August 2, 1954, Serial No. 447,175
6 Claims. (Cl. 190—57)

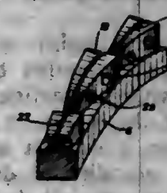
1. A hollow handle, comprising; a one piece substantially ring shaped member embodying a pair of ring sections each having spaced inner and outer rims and having spaced exteriorly convexed surfaces and spaced internally concaved surfaces, spaced web means intermediate said sections and integral therewith, a flexible wrapper having a centrally arranged opening and defining a closed intermediate portion secured to said convexed surfaces and having an outer margin turned over said outer rims and secured against said concaved surfaces and having an inner interrupted margin turned into said opening and over said inner rims and secured against said concaved surfaces adjacent said opening, said wrapped ring shaped member being foldable along said web means to define said pair of ring sections, substantially U-shaped keeper means integral with and extending inwardly from the outer rim of one of said sections to overhang the con-

caved surface thereof, and a tongue integral with and inwardly extending from the outer rim of the other section of said pair to overhang the concaved surface thereof and adapted pursuant to folding of said ring shaped member along said web means to be frictionally received by said keeper means to interlock therewith to hold said ring sections closed and in juxtaposition.



2,771,168
CLUTCH AND THROTTLE CONTROL FOR ENGINE
Erwin J. Panish, Bridgeport, Conn.
Application June 27, 1952, Serial No. 295,955
21 Claims. (Cl. 192—.096)

1. For use with a primer mover, having a throttle for controlling its speed of rotation and having a clutch-reverse gear for controlling the direction of rotation of the prime mover's output shaft; a combined throttle and clutch control device comprising a base; a pair of throttle and clutch control members having handles for manual operation; means for mounting said members on the base, whereby the operating handles are movable in adjacent, substantially parallel paths, said control members and associated handles being movable in either of opposite directions from a common neutral or normal position; push-pull links for connecting said control members with the clutch-reverse gear and the throttle of the prime mover; connecting means between the throttle control member and the throttle link providing for axial movement of the throttle link in throttle opening direction when the throttle control member is moved in either of opposite directions from its neutral or normal position; and connecting means between the clutch-reverse gear control member and the clutch-reverse gear link, providing for axial movement of the clutch-reverse gear link in either of opposite directions from its neutral or normal position, said handles being positionable for simultaneous gripping by one hand whereby they both may be simultaneously moved in the same direction from said neutral or normal position by said one hand to either forward or reverse position to simultaneously engage the clutch-reverse gear and open the throttle.



2,771,169
ROTARY WORK TABLE
Magnus Wahlstrom, Easton, Conn., assignor to The Bridgeport Machines, Inc., Bridgeport, Conn., a corporation of Connecticut
Application October 6, 1953, Serial No. 384,443
20 Claims. (Cl. 192—4)

1. Mechanism inclusive of disconnectable gearing for setting and holding an angularly adjustable rotary member in selective rotary positions, comprising gear tooth clash preventive interlocking devices including in combination with the rotary member and a base structure rotatably supporting the same, driven gear teeth connected to transmit rotary movement to said member when impelled, a drive disconnecting gear carrier mounted on said base structure in shiftable relation thereto, a driving gear rotatably mounted on said carrier in a manner to be shifted body therewith into and out of driving mesh with said driven teeth, a check connected to be moved in a

predetermined path by gear shifting movement of said gear carrier, and a barrier connected to be impelled into and out of said path of check movement by rotary movement of said member to and from at least one predetermined position thereof relative to said base structure, together with a brake drum carried by said member in fixed relation thereto, a brake band anchored on said base structure encompassing said drum at least in part, and means to tighten and loosen said band with respect to said drum when said driven teeth and said driving gear are either in mesh or out of mesh.

2,771,170
CENTRIFUGAL POWDER CLUTCHES
Ferdinand Badin, Paris, France
Application March 28, 1951, Serial No. 217,927
Claims priority, application France July 5, 1950
4 Claims. (Cl. 192—58)

1. A centrifugal powder clutch comprising a hollow casing member and a rotor member within said casing and coaxial therewith, the casing having an inner peripheral wall shaped as a surface of revolution, the rotor having in the peripheral zone thereof a plurality of circumferentially spaced protruding portions lying in a surface of revolution coaxial with and spaced from the inner peripheral wall of the casing, each of the peripheral portions having a peripheral side inclined with a component toward the hub of the rotor member, and a powder-guiding peripherally directed groove in each of the said peripheral sides.

2,771,171
MAGNETICALLY ACTIVATED TORQUE COUPLING
Oswald C. Schultz, St. Joseph, Mich., assignor to Laboratory Equipment Corporation, St. Joseph, Mich., a corporation of Michigan
Application July 6, 1955, Serial No. 520,196
9 Claims. (Cl. 192—84)

1. A magnetically activated torque limiting coupling adapted for use between two structural members rotatable one with respect to the other, comprising, in combination, drum means defining an annular interior surface facing

radially inward toward the axis of said surface, said drum means including magnetic material immediately backing up said annular surface thereon, said drum means being adapted for connection to one of the structural members, a circular rotor body of nonmagnetic material adapted for connection to the other structural member and shaped and dimensioned to fit at least partially within the space encircled by said annular drum surface, said rotor body as such being freely turnable with respect to said drum

means, said rotor body defining a plurality of circumferentially spaced outwardly open radial slots therein, a pair of generally flat magnetic pole pieces slidably mounted in each of said rotor slots at opposite sides thereof for free radial movement into engagement with said drum surface, and a generally flat permanent magnet sandwiched between each pair of pole pieces, each magnet having magnetic poles of opposite polarity on opposite sides thereof immediately contiguous to the respective pole pieces adjacent thereto.

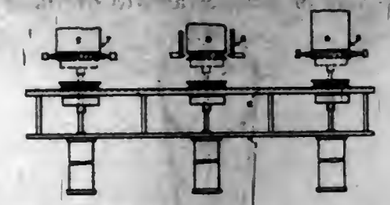
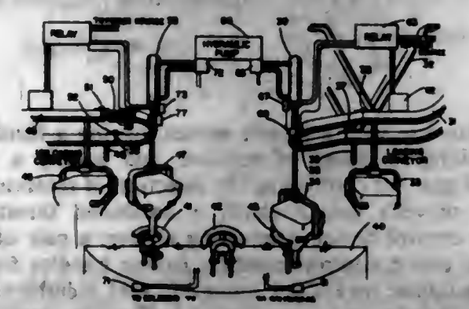
**2,771,172**
**TRANSFER TABLES**
**Richard H. Bergstrand, Moline, Ill., assignor to The Moline Tool Company, Moline, Ill., a corporation of Illinois**
**Application February 12, 1954, Serial No. 409,826**
**6 Claims. (Cl. 198—19)**



1. In power actuated mechanism adapted to transfer pieces from one position to another by a reciprocating member at high speed while preventing the moving piece from travelling beyond the range of the reciprocating member, in combination, a support at each of several stations for one of a plurality of duplicate pieces, a guiding element extending over all the supports and engaging all of the pieces in a manner to assure the movement of all pieces along the same path, a bar axially movable parallel to said path, power means adapted to rapidly move said bar through a fixed distance in either direction, devices carried by said bar that are adapted to engage each of said pieces on opposite sides, automatic means which will cause said devices to engage each of said pieces when moving in one direction and bringing the pieces to rest when the bar reaches the end of its travel and disengaging from said pieces when the bar moves in the opposite direction.

---

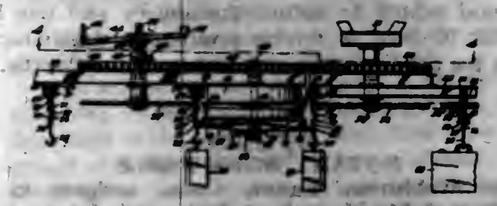
**2,771,173**
**TRANSFER MECHANISM**
**Frederick P. Sharpe, Dearborn, Mich., assignor to Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware**
**Application February 25, 1952, Serial No. 273,187**
**4 Claims. (Cl. 198—19)**



1. Mechanism for transferring wheel body and rim assemblies to successive work stations spaced from each other comprising a reciprocable member extending through the work stations for engaging the rims and supporting the assemblies, devices on said member spaced from each other the same distances as the corresponding work stations are spaced from each other, said devices each having a pair of opposed abutment bars for engaging the rims and positioning the assemblies and a pair of spring urged pins on one bar of each pair of opposed bars and movable transversely of said one bar for engag-

ing the rims and holding the same on said member, and means operatively connected to said member for reciprocating the same from a position at the rearward end of the stroke locating said devices in positions registering the assemblies with the work stations to a position at the forward end of the stroke locating said devices in positions to engage the rims of the adjacent forwardly located assemblies.

---

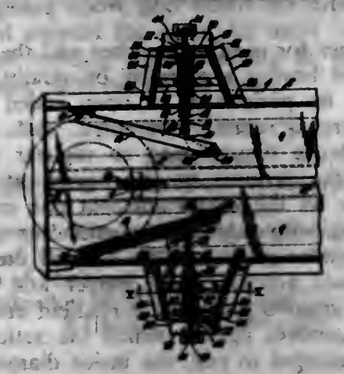


**2,771,174**
**CONVEYOR TRANSFER**
**James Christoffersen, West Newbury, Mass., assignor to Columbia Broadcasting System, Inc., Danvers, Mass., a corporation of New York**
**Application February 16, 1953, Serial No. 337,046**
**4 Claims. (Cl. 198—21)**

1. A self-loading conveyor for products comprising, a track, an endless movable chain carried on said track, a plurality of spaced saddles depending from said belt, said track being formed into at least one semicircular loop, hinges connecting the ends of said loop to said track, power means operative on said semicircular loop, and switching means for triggering said power means as one of said saddles reaches said loop, whereby said one of said saddles is lowered to pick up or deposit a product.

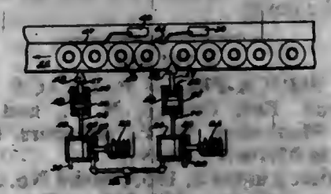
---

**2,771,175**
**OVERHEAD CONVEYOR**
**James Starr Da Costa, Merchantville, N. J., assignor to Samuel Olson Mfg. Company, Inc., Chicago, Ill., a corporation of Illinois**
**Application May 25, 1951, Serial No. 228,316**
**14 Claims. (Cl. 198—25)**



8. In combination, a plurality of conveyors, means for driving one of said conveyors and for driving another of said conveyors from said first-mentioned conveyor, each conveyor shaped to receive removably a plurality of load carriers, means for transferring said load carriers from one conveyor to another, said means comprising a rotary transfer member positioned between adjacent parts of two conveyors, and means for raising and lowering opposite ends of said transfer member simultaneously and to move them in opposite directions simultaneously, each end of said transfer member being shaped to engage a load carrier, the raising movement of said transfer member being effective to remove a load carrier from one conveyor and the lowering movement of said transfer member being effective to deposit a load carrier on the other conveyor.

---



**2,771,176**
**CONDITIONING DEVICE FOR BUNDLES OF COILED MATERIAL**
**Robert Clark, Parma, and William H. Johns, Gates Mills, Ohio, assignors to United States Steel Corporation, a corporation of New Jersey**
**Application February 25, 1955, Serial No. 490,540**
**5 Claims. (Cl. 198—29)**

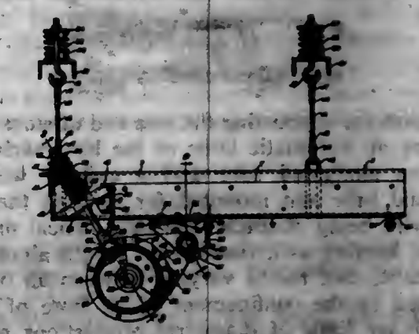
1. In a drag conveyor including a frame, a supporting surface on said frame having an entry end and an exit end, and means for moving a bundle of coiled material along said supporting surface from the entry end to the exit end thereof, the improvement therewith of a pair of spaced upright conditioning plates each pivoted at one end to said frame adjacent said entry end and extending therefrom toward said exit end along said supporting surface, the inner face of each of said conditioning plates having a concave surface along its length extending to a point short of the free end thereof and a plane surface extending from said point to said free end, resilient means detachably and pivotally connected with each plate at a point adjacent the end thereof remote from said pivoted end for yieldably urging said plates toward each other, and a bracket pivotally mounted on each side of said frame rigidly supporting one of said resilient means, each of said brackets being adapted to be pivoted away from said frame when the resilient means associated therewith is detached from the plate to remove said resilient means from the vicinity of said supporting platform.

---

**2,771,177**
**ARTICLE GROUPING APPARATUS**
**Richard W. Cutter, Berkeley, Kazimer A. Strzala, Walnut Creek, and William L. Fry, Lafayette, Calif., assignors to Owens-Illinois Glass Company, a corporation of Ohio**
**Application July 30, 1953, Serial No. 371,308**
**15 Claims. (Cl. 198—34)**

10. The combination of means for conveying articles in succession along a predetermined path, means for confining the articles within said path, a stop, a feeler projecting into said path and momentarily held in a retracted position by each passing article, means controlled by the feeler for projecting the stop into the path of the articles, means for preventing said projecting of the stop when the feeler is only held momentarily in said retracted position, and article arresting means in advance of said stop for causing accumulation of a group of the articles in position to hold the feeler in retracted position and thereby causing the stop to be projected.

---

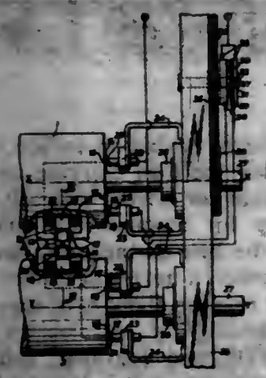


**2,771,178**
**BELT CONVEYOR TAKE-UP**
**Max Holmburger, Chicago, Ill., assignor to Link-Belt Company, a corporation of Illinois**
**Application May 9, 1952, Serial No. 287,053**
**6 Claims. (Cl. 198—139)**

1. In a belt conveyor having an endless conveyor belt, means for supporting the load carrying and return runs of the belt, and means for driving said belt, the improvement of a take-up for automatically maintaining the proper tension in the belt during operation of the conveyor which comprises a reversing pulley and a bend pulley mounted for rotation about fixed axes, spaced from each other longitudinally of and located at vertically stepped levels beneath said conveyor, about which the return run of the conveyor belt is trained for defining a take-up loop portion of said run, an elongated frame mounted for rectilinear movement longitudinally of said conveyor beneath said reversing pulley and toward and away from said bend pulley, a take-up pulley mounted on the outer end of said frame about which the take-up loop of the belt is trained, said take-up pulley being so located and having such a diameter as to position the two runs of said loop in parallel relationship with the direction of movement of said frame, means mounted longitudinally along said frame for movement therewith to continuously support the variable length of belt in the upper run of the take-up loop in said parallel relationship, means mounted along and below the path of movement of the frame for continuously supporting the variable length of belt in the lower run of the take-up loop in said parallel relationship, and means for applying a constant force to said frame to urge the latter in a direction to increase the length of the take-up loop.

---

**2,771,179**
**OSCILLATING FEEDERS**
**Albert Musschoot, Park Ridge, Ill., assignor to Link-Belt Company, a corporation of Illinois**
**Application September 27, 1955, Serial No. 536,830**
**10 Claims. (Cl. 198—220)**



1. A vibratory feeder, comprising a material supporting pan, resilient means supporting said pan for vibra-

tory movement, a drive arm connected to said pan for pivotal movement relative thereto, an unbalanced shaft mounted on said arm for rotation about an axis in spaced parallel relationship with the axis of said pivotal connection, said arm being connected to said pan with the axes of said shaft and said pivotal connection lying in a plane which is inclined relative to the plane of the pan bottom and passes substantially through the center of gravity of the pan and the material thereon, and drive means mounted on said arm for rotating said unbalanced shaft.

---

2,771,180
**APPARATUS FOR TREATING THREADS**
Sydney W. Barker, Colne, England, assignor to Lastrafil Limited, Nelson, England, a British company
Application July 7, 1953, Serial No. 366,598
Claims priority, application Great Britain July 9, 1952
23 Claims. (Cl. 203—65)

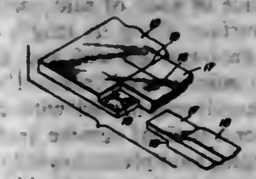
1. Apparatus for laying a thread in figure-8 loops around a pair of oppositely rotating rollers whose working surfaces are mutually inclined and provide means for storing and advancing thread thereon, comprising in combination a shuttle-member to which the thread can be attached, said shuttle-member being capable of being carried on the periphery of said rotating rollers, each of said rollers having gripping means mounted thereon adjacent the point where the thread is discharged therefrom for releasably securing said shuttle-member thereto, and actuating means for controlling said gripping means to position and carry said shuttle-member on the surface of one of said rotating rollers and then on the other oppositely rotating roller and to transfer said shuttle-member from one roller to the other as it passes between said rollers.

---

2,771,181
**STOCK TUBE**
Donald H. Montgomery and Clarence D. Pulsifer, Farmington, Conn., assignors to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut
Application January 14, 1953, Serial No. 331,221
8 Claims. (Cl. 203—92)

1. Means for supporting the free end of stock rotatably carried by an automatic lathe or the like machine, comprising an elongated tube and a coil of wire wound within said tube and mounted for rotation therein, said coil of wire being characterized by a helical progression of radius varying as a function of length along the axis of said tube, said radius varying between an outer limit determined by the confinement of the bore of said tube and an inner limit of diametral proportions no greater than at least the maximum diametral extent of stock to be accommodated therein whereby the stock may carry said coil of wire for rotation so that lubricant within said tube may be dispersed and distributed by movement of said coil over the inner wall of said tube and so that coil-to-tube frictional drag may be kept to a minimum, further whereby the stock may not be marred as it is rotated within and fed through said tube.

---



2,771,182
**DISPENSING CONTAINER FOR NEEDLES, PUNCHES, AND THE LIKE**
Robert C. Messmer, Chester, Pa., assignor to American Viscose Corporation, Philadelphia, Pa., a corporation of Delaware
Application November 23, 1954, Serial No. 470,780
5 Claims. (Cl. 206—17)

1. A container for needles, punches and the like comprising a barrel having a plurality of axially extending grooves along its periphery, an open ended sleeve in which said barrel is rotatably mounted, walls defining a slot in said sleeve dimensioned to register selectively with each of the grooves on the barrel, at least one annular groove on the barrel adjacent one end thereof and intersecting with said axially extending grooves, a cooperating annular groove in the bore of the sleeve in registry with said groove on the barrel, and a resilient O-ring in said grooves providing a resilient end wall for all the axiall grooves against which the articles in the container are adapted to rest, the inside diameter of the O-ring being less than the root diameter of the barrel at said axial grooves.

---

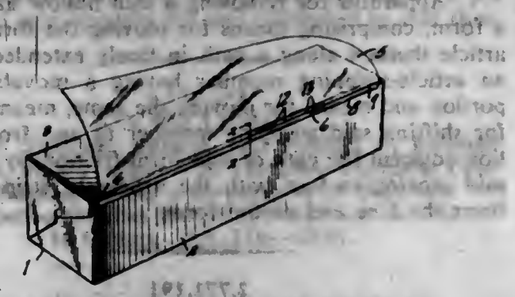
2,771,183
**MATCH BOOK**
Eugene C. Carter, Lamar, S. C.
Application May 19, 1955, Serial No. 509,538
1 Claim. (Cl. 206—34)

A match book of the character described comprising: a cover comprising an elongated strip having its end portions folded transversely on itself to provide a back, a front and a closure flap engageable on the said front, match cards mounted in the cover and including outwardly and reversely folded end portions anchored between the front and the back, said cards having longitudinal slits therein extending to the free ends thereof defining flat faced detachable matches, said matches having transversely extending, longitudinally staggered incisions in the opposite faces thereof adjacent the anchored ends of the cards, igniting heads adjacent one end on the outer faces only of the matches, and friction surfaces on the opposed faces of the front and back engageable by the heads for igniting same as the matches are withdrawn from the cover.

---

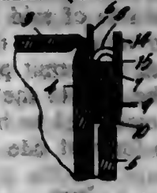
2,771,184
**SHOCK-PROOF PACKAGE**
Earle R. Ryno, East Orange, N. J., and William M. McKillop, Manhasset, N. Y., assignors, by mesne assignments, to Merle M. Hoover
Application August 3, 1953, Serial No. 371,784
1 Claim. (Cl. 206—46)

A shock-proof container comprising a tubular member of polygonal cross section, a pair of rings having approximately the same diameter as said tubular member and each rotatably supported on an end of said member, a plastic tube member within said polygonal member having its ends extending through and down over the outside of said rings and secured thereto, the plastic tube being adapted to



contain an article and being of a length to permit it being twisted together above and below the article thereby to enclose and support the same, an outer casing for supporting and holding said members in alignment, and means closing each end of the casing.

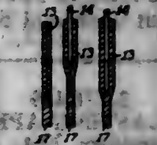
---



2,771,185
**DISPENSING CARTONS PROVIDED WITH CUTTERS**
James Edward Annen, Kalamazoo, Mich., assignor to Sutherland Paper Company, Kalamazoo, Mich., a corporation of Michigan
Application May 5, 1954, Serial No. 427,718
6 Claims. (Cl. 206—58)

1. A dispensing carton including a front wall and cover therefor having a closure flap adapted to be positioned on the inner side of the front wall, a cutter of downwardly facing U-shape having a bight portion and substantially parallel arms terminating in inwardly converging flange-like edge portions, a series of teeth struck out from the bight portion with their bases spaced and merging into one arm of the cutter with their tips projecting above the bight thereof, the portions of said bight portion intermediate the spaced bases of the teeth integrally connecting the parallel arms of the cutter to each other, said cutter being of a length substantially that of the front wall and being embracingly disposed over the edge of the front wall with the arms thereof in fixedly clamped engagement therewith, and with the flange-like edge portions of the arms in embedded engagement with the front wall, said cutter constituting a reinforcing and binding element for the edge of the front wall and having the portion thereof intermediate the ends of the cutter bowed longitudinally of the cutter and inwardly relative to the carton and towards the closure flap disposed on the inner side of the front wall whereby the central portion of the cutter is normally in springable thrust engagement with the dispensed material between it and the closure flap and whereby the cutter counteracts outward bending of the central portions of the cutter and front wall when the dispensed material is pulled out of the carton and over the cutter preparatory to and while severing the material.

---

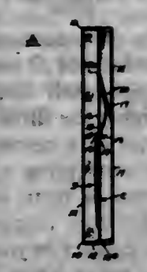


2,771,186
**DISPENSING CARTON, CUTTER AND METHOD OF MAKING**
Wendell T. Burbank, Three Rivers, Mich., assignor to Sutherland Paper Company, Kalamazoo, Mich., a corporation of Michigan
Application October 24, 1952, Serial No. 316,593
8 Claims. (Cl. 206—58)

5. An elongated strip of U-section adapted to be disposed over a carton wall formed of a strip of ductile metal folded longitudinally upon itself into a general U-shape and having a curved bight, the arms of the cutter being spaced to receive the wall of a carton between them and terminating in inwardly converging was clamping flanges, said cutter having a series of teeth spaced at their bases struck out from its bight and disposed in the plane of an arm of the cutter to project beyond the bight portion thereof, the arms of the cutter being integrally connected between the bases of the teeth.

---

2,771,187
**NEEDLE PACKET**
Clement Halle, North Hollywood, Calif., assignor to Free Sewing Machine Co., Beverly Hills, Calif., a corporation of Illinois
Continuation of application Serial No. 231,743, June 15, 1951. This application May 9, 1955, Serial No. 506,810
2 Claims. (Cl. 206—66)



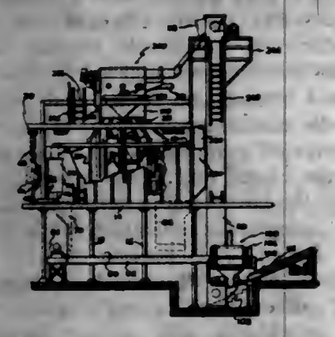
1. In combination, a plurality of sewing needles having blunt butt portions and sharply pointed ends, and a needle packet comprising a cover made of relatively stiff cardboard providing a back portion with a folded end portion defining a transverse narrow channel, and a front flap portion foldable and unfoldable relative to the other end of the back portion and adapted to have its free end portion retained behind said folded end portion, and an elongated needle containing envelope made of a relatively pliable waterproof material closed at one end and open at the other, the closed end being disposed in the aforesaid channel in the cover and fastened in place therein in more or less compressed condition by a staple passed through the folded end portion of the cover and the closed end portion of the envelope therein, the open end portion of said envelope having a needle retaining flap foldable and unfoldable with respect thereto, the sewing needles being disposed lengthwise in said envelope with their sharply pointed ends held frictionally between the otherwise tightly abutting front and back walls of the envelope in the aforesaid channel of the cover while their blunt butt ends are disposed toward the open end of the envelope.

---

2,771,188
**DISPLAY CARD**
William B. Coulter, Southport, Conn., assignor to Manufacturers Box Company, Inc., Bridgeport, Conn., a corporation of Connecticut
Application November 1, 1954, Serial No. 465,863
4 Claims. (Cl. 206—75)

1. A card for holding and displaying a spoon, fork or similar article having a head and a handle connected

by a neck, and wherein said head and handle lie at opposite sides of a flat plane and said neck traverses said plane, said card comprising a planular panel having a longitudinal dimension greater than the length of said article for receiving said article along a longitudinal line between its ends, and having a neck receiving slot at an intermediate point of said line, a head receiving portion longitudinally at one side of said slot and a handle receiving portion longitudinally at the other side of said slot, said slot adapted to permit passage of said handle therethrough from the rear to the front of said card to engage said neck therein and to bring said handle into engagement with the forward side of said handle receiving portion, and said head receiving portion having a U-shaped cut substantially conforming to the outline shape of the head of said article and centrally aligned with said longitudinal line with its closed end adjacent to and longitudinally spaced from said slot, the portion of said card between said slot and said cut being unbroken to provide a neck holding band, said cut defining a tab bendable from the plane of said card to its rearward side about a transverse hingle line extending across the open end of said cut for supporting engagement with the rearward side of the head of said article with the forward side of said head received and displayed in the opening defined by said cut upon said bending of said tab.



---

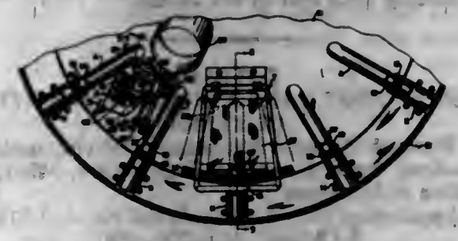
2,771,189

## WORK BLASTING APPARATUS

Adolph J. Kriz, Hagerstown, Md., assignor to Pangborn Corporation, Hagerstown, Md., a corporation of Maryland

Application November 8, 1952, Serial No. 319,550
4 Claims. (Cl. 209—21)

1. In a work blasting apparatus, a recycling system for collecting particles resulting from a blasting operation, separating re-usuable blastant particles from non-reusable particles, removing the non-reusable particles, and returning the blastant particles to a blasting position where they are again available for use in a blasting operation, said recycling system comprising a hopper positioned to receive the particles resulting from a blasting operation, conveying means to convey said particles to a first separating device, said first separating device comprising a rotatable, perforated, open-ended, hollow drum, an advancing mechanism in said drum for advancing the particles, axially of said drum, from one open end to the second open end thereof, while it rotates, said drum acting to sift particles, of a size determined by the perforations therein, through said perforations while it rotates and, at the same time, actuating said advancing mechanism to convey larger particles axially therethrough, means at said second open end to convey said larger particles away from said separating device, transfer means to transfer those particles which are sifted through the perforations of said drum, to a second separating device, fluid-pressure means in said second separating device for separating the particles therein into predetermined size classifications, means to separately collect the particles of each of said size classifications, and means for returning the particles of one of said size classifications, comprising the blastant particles, to said blasting position.



---

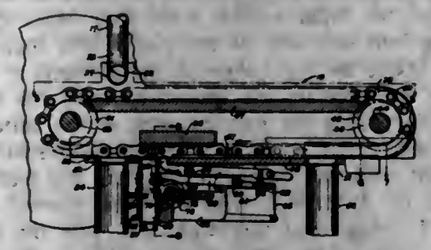
2,771,190

## APPARATUS FOR TESTING AND SORTING THIN RUBBER ARTICLES

John R. Gammeter, Akron, Ohio

Original application June 10, 1949, Serial No. 98,332, now Patent No. 2,649,966, dated August 25, 1953. Divided and this application March 16, 1953, Serial No. 342,525
7 Claims. (Cl. 209—74)

1. Apparatus for removing a thin hollow article from a form, comprising means for moving the form with an article thereon along a path in freely extended position, an article-stripping member having a movable surface portion and means for moving the same, means operable for shifting said stripping member to and from a position adjacent the path of said form frictionally to engage said moving surface with the article to strip the same from the free end of the form.



---

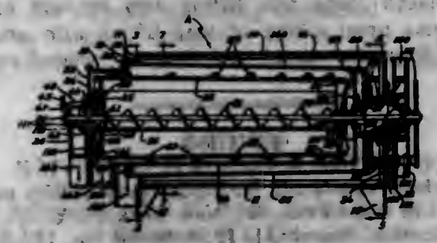
2,771,191

## CAPSULE SELECTOR AND RECTIFIER MECHANISM

Alfred W. Kath, Cleveland, Ohio, assignor to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

Application January 19, 1953, Serial No. 331,873
8 Claims. (Cl. 209—75)

5. In a machine of the class described, means for continuously feeding capsules to a conveyor, said conveyor having means for individually orienting the capsules one from another and transporting said capsules in horizontally disposed condition, a bed plate associated with said conveyor, said bed plate having an opening therein of such size as will permit the passage therethrough of only separated cap or body components of a capsule and thus cause their rejection, means for sensing the lateral disposition of the caps and bodies of joined capsules as they come into association with said sensing means, a pair of cap and body fulcrum blades each being movable into and out of fulcruming position in timed relation to the advance of said capsules through said sensing means, and latch means associated with and operable by said sensing means effective to latch and maintain a selected one of said fulcrum blades corresponding to the lateral disposition of the cap of the particular capsule being sensed by said sensing means whereby each capsule is uprighted solely by the force of gravity.



---

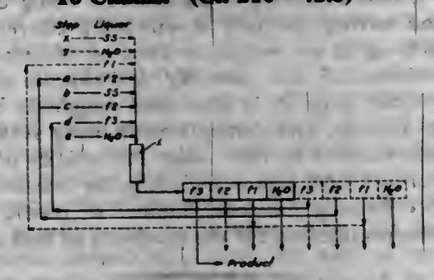
2,771,192

## GRAIN CLEANING APPARATUS

Harry A. Lindahl and Karl Gustaf Strandberg, St. Paul, Minn., assignors to Ideal Grain Cleaner Company, St. Paul, Minn., a corporation of Minnesota

Application June 30, 1951, Serial No. 234,512
6 Claims. (Cl. 209—95)

1. A grain separator including a separating cylinder, means rotatably supporting said cylinder, a retarder at one end of said cylinder, said retarder comprising an arcuate shoe arranged in surface contact with the inner surface of said cylinder at one end thereof, means supporting said shoe for movement longitudinally of said cylinder, an arm connected at one end to said shoe and hinged intermediate its ends, said arm supporting said shoe for radial movement, and a counter-weight on the end of said arm opposite the end connected to said shoe.



---

2,771,193

## ION EXCLUSION

Donald W. Simpson, Auburn, and William C. Bauman, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Application October 19, 1953, Serial No. 386,782
16 Claims. (Cl. 210—42.5)

13. In a method for treating an aqueous starting solution containing a highly ionized solute having an ionization constant at least as great as $5 \times 10^{-2}$ and a less extensively ionized solute that is capable of being absorbed by an ion exchange resin and that has an ionization constant not greater than $2 \times 10^{-1}$ and not more than 70 percent as great as that of the highly ionized solute to separate a liquor fraction containing the less ionized solute in a concentration higher than in the starting solution and in a form substantially free of the highly ionized solute, wherein there is carried out a first cycle of operations of feeding to a bed of an ion exchange resin, having an ion identical with an ion of the highly ionized solute, a sufficient amount of such aqueous starting solution, containing the highly ionized solute in at least as high as l-normal concentration, so that part of the less ionized solute is preferentially absorbed by the resin leaving the highly ionized solute and the remainder of the less ionized solute in surrounding liquor, feeding water to the bed to displace liquid therefrom, collecting successive fractions of the displaced effluent liquid, whereby there are obtained a fraction *f1* of the effluent liquid containing the highly ionized solute in a form substantially free of the less ionized solute, a mixed fraction *f2* of the effluent liquid containing both of the solutes, and a fraction *f3* of the effluent liquid containing the less ionized solute in a form substantially free of the highly ionized solute, the steps of carrying out a second operating cycle which comprises feeding a fore-portion of said effluent liquor fraction *f2* to the bed of ion exchange resin, then feeding a further amount of the starting solution, containing both of the solutes with the highly ionized solute in at least as high as l-normal concentration, to the bed, next feeding to the bed a later portion of the effluent liquor fraction *f2*, next feeding to the bed at least a portion of said effluent liquor fraction *f3*, and next again feeding water to the bed and, collecting successive portions of the effluent liquor similar in kind to those collected in the first cycle, including a portion of effluent liquor containing the less ionized solute in a concentration higher than in the starting solution, repeating at least once this second cycle of operations and withdrawing a portion of the effluent liquor fraction *f3* which contains the less ionized solute in a concentration higher than in the starting solution.

---

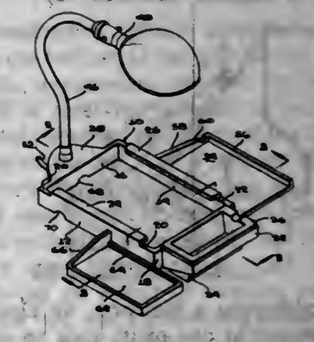
2,771,194

## METHOD OF FILTERING

Thomas D. Baxter, East Petersburg, and Alexander A. McIntyre, Lancaster, Pa., assignors, by direct and mesne assignments, to Baxter Filtration Corporation, Lancaster, Pa., a corporation of Pennsylvania

Application September 14, 1953, Serial No. 379,784
5 Claims. (Cl. 210—150)

4. The method of filtering a liquid containing suspended solids which comprises the steps of forcing the liquid under pressure through a filter medium, and relieving the pressure while the liquid is still flowing through the medium to discontinue the flow and permit the liquid to fall away from the medium.



---

2,771,195

## UTILITY ATTACHMENT FOR TELEPHONES

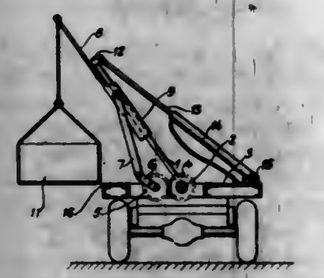
Adlai E. Rhea, Shreveport, La.

Application November 6, 1953, Serial No. 390,645
2 Claims. (Cl. 211—86)

2. In combination, a telephone base having a top, a bottom, sides and ends, an open frame having side walls and end walls, said side walls being removably engaged with said base sides and said end walls being removably

engaged with said base ends, said side walls having upper and lower edges, and laterally inwardly extending flanges on and extending along said side walls in the regions of their upper edges, said flanges resting upon the base top and having ends spaced longitudinally inwardly from said end walls, said flanges having free inner longitudinal edges spaced from each other crosswise of the frame, and a lamp supporting flange on and projecting laterally outwardly from one of said end walls.

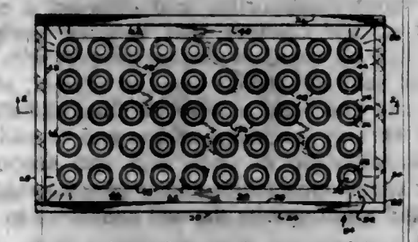
---



**2,771,196**
**SUSPENSION DEVICES FOR SUPPORTING ARTICLES OF WEARING APPAREL**
**Albert Scheuermann, Friedrichshafen, Germany, assignor to August Enders Aktiengesellschaft, Oberrahmede, Westphalia, Germany**
**Application November 18, 1953, Serial No. 392,793**
**1 Claim. (Cl. 211—94)**

A device for supporting articles of wearing apparel and the like suspended on a hanger provided with a hook, comprising a guide rail provided with a longitudinal slot along the bottom surface thereof, the edges of the rail being turned up to provide trackways along opposite sides of the slot, a suspension member comprising a flat sheet metal body portion with the lower portion provided with an opening therein to receive the hook of the hanger, said body portion having at least two upstanding, flat, spaced-apart lugs integral therewith and positioned in the same plane thereof and which extend into said slot, the upper portion of each lug being provided with an opening, an axle disposed in each opening, wheels mounted on opposite ends of said axles for supporting said body portion on said trackways, and an annular bumper and spacer member mounted on each of said axles between said wheels and extending outwardly beyond both sides of the axle, each member comprising an eye portion which engages the axle and a body portion in the form of a loop, said eye portion and said body portion being provided with slots through which a lug of the suspension member extends.

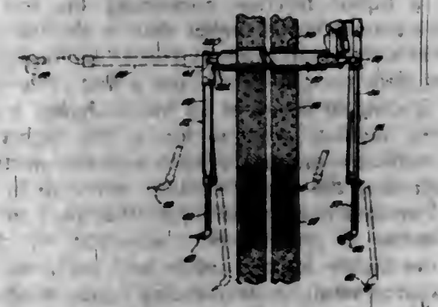
---



**2,771,197**
**HOISTS**
**Ulf Edvin Leffler, Kinna, Sweden**
**Application August 3, 1951, Serial No. 240,169**
**9 Claims. (Cl. 212—8)**

1. A hoist comprising a platform, an elongated lifting arm tiltably mounted at one of its ends on said platform, a first rotatable member connected to said lifting arm adjacent said platform, said first rotatable member being movable with said lifting arm whereby the angular position of said first member varies with variations in the tilt position of said lifting arm, a second rotatable member mounted on said platform adjacent said first member and operatively interconnected with said first rotatable member whereby the angle of rotation of said second member is dependent upon the angle of rotation of said first rotatable member, a first rigid link radially connected to said second rotatable member, a load suspension member slidably displacable along said lifting arm, a second rigid link pivotally connected at one of its ends to said suspension member and pivotally connected at the other of its ends to said first rigid link at a pivot point displaced from the center of rotation of said second member, and means for selectively tilting said lifting arm whereby said suspension member is automatically variably displaced along said lifting arm by said first and second links upon tilting of said lifting arm and upon corresponding rotation of said first and second rotatable members.

---

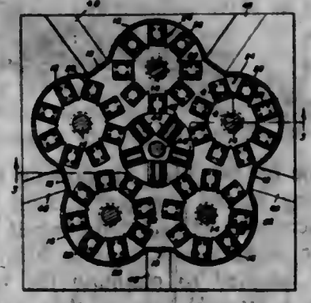


**2,771,198**
**COUNTING AND SORTING DEVICE**
**Ira Danchig, New York, N. Y., assignor of fifty percent to Peter Fries, Jr., New York, N. Y.**
**Application August 31, 1950, Serial No. 182,522**
**4 Claims. (Cl. 214—1)**

1. A counting and sorting device comprising a housing having a recess formed therein defined by upstanding enclosing side walls, matrix means in said recess, with a plurality of article receiving compartments formed in a surface of said matrix means, said article receiving compartments being constructed and arranged to receive one said article in each article receiving compartment, each of said article receiving compartments being circular in plan, and having inwardly downwardly convergent wall surfaces lying in an imaginary cone of one altitude, and other portions of said inwardly downwardly convergent wall surfaces lying in at least one imaginary cone of a different altitude, said compartments being vertically differentially stepped to form seats for articles of differing cross sections, and means including an outstanding wall adjustably limiting the total number of article receiving compartments opening for the reception of said articles.

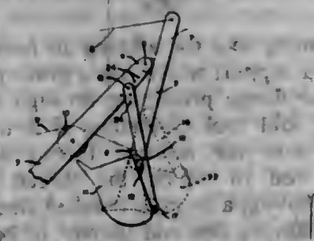
---

**2,771,199**
**REMOTE CONTROL MANIPULATOR**
**Demetrius G. Jelatis, Red Wing, Minn., assignor to the United States of America as represented by the United States Atomic Energy Commission**
**Application April 12, 1955, Serial No. 501,006**
**6 Claims. (Cl. 214—1)**



1. A remote-control manipulator comprising a horizontal support, master and slave arms connected to the support at regions spaced lengthwise thereof for pivoting with respect to the support, a handle and a grasper connected with the master and slave arms, respectively, tie means interconnecting the handle and the grasper for causing movements of the handle to be reproduced by the grasper, link means interconnecting the arms for causing the arms to pivot conjointly with respect to the support, means for adjusting the link means to vary the angular relationship between the arms for adjusting the spacing between the handle and the grasper and to enable the slave arm to be angularly shifted into alignment with the support for installation and removal of the manipulator, and a special counterweight for the slave arm located adjacent the connection of the master arm and the support and being connected with the slave arm so as to move conjointly therewith during angular shifting of the slave arm with respect to the master arm.

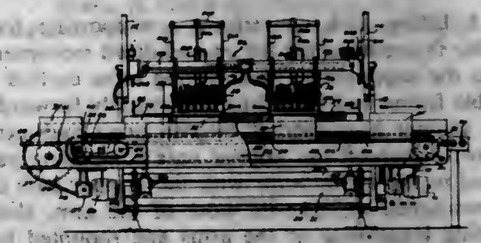
---



**2,771,200**
**CAR PARK**
**Joseph W. Gilliard, Phoebus, Va.**
**Application April 12, 1954, Serial No. 422,437**
**7 Claims. (Cl. 214—16.1)**

1. A building for parking cars comprising a floor, a continuous side wall forming an enclosure, and a roof, a plurality of circularly arranged, circumferentially spaced supporting columns extending between said floor and said roof and supporting the latter, a series of vertically stacked parking platforms disposed in each column and independently rotatable thereon, an elevator assembly disposed centrally of said columns, said building having a radially extending driveway disposed between each pair of columns, an elevator platform having a plurality of spoke portions corresponding to the number of said driveways, means for independently rotating each one of said parking platforms, and means for rotating said elevator platform between a position, when lowered, in which its spokes are in alignment with said driveways to a position, immediately upon the start of its ascent, wherein its spokes project in the direction of the centers of said columns.

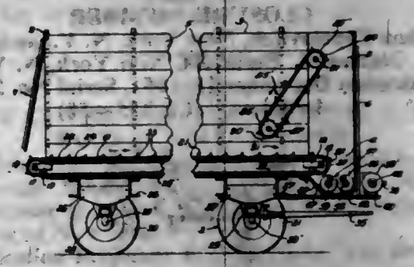
---



**2,771,201**
**TRENCH HOE**
**Ralph H. Slater, Duluth, Minn.**
**Application September 4, 1953, Serial No. 378,513**
**4 Claims. (Cl. 214—138)**

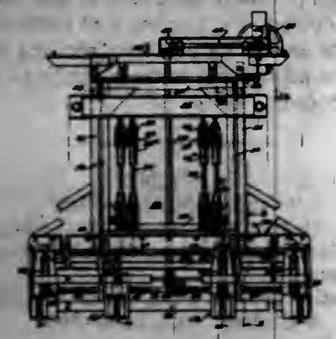
1. In a trench hoe machine for excavating material having a boom, the combination of a dipper stick pivotally mounted intermediate the ends thereof to the end portion of said boom for pivotal movement about a horizontal axis, cable means connected to said stick adjacent the opposite ends thereof for pivotally moving said stick alternately in opposite directions about the horizontal axis, a bucket pivotally mounted adjacent the leading end thereof to the lower end of said stick, and a longitudinally extending brace pivotally mounted at one end thereof to said bucket adjacent the trailing end thereof, said brace at the opposite end being pivotally secured to said boom in inwardly spaced relation to the mounting of said dipper stick on said boom.

---



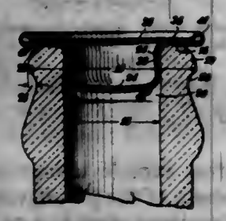
**2,771,202**
**CASE UNLOADERS**
**George L. N. Meyer, Milwaukee, Wis., assignor to Geo. J. Meyer Manufacturing Co., Cudahy, Wis., a corporation of Wisconsin**
**Application June 6, 1951, Serial No. 230,110**
**6 Claims. (Cl. 214—309)**

1. In a case unloader for pick up, elevation and transfer of case contents from a case to a table conveyor, a pick-up head beam having a beam swinging mounting including a beam support and a beam swing frame comprising spaced frame members each having a guideway, said swing frame being mounted for oscillation of the beam in said guideways over the case and the support being mounted for movement of the beam in a separate path of movement provided by said guideways in said swing frame.



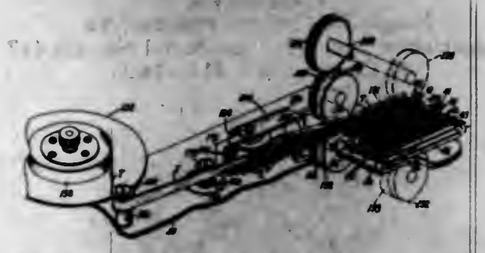
---

**2,771,203**
**VEHICLE WITH SELF-UNLOADING MECHANISM**
**William F. Collins and John H. Bing, Downers Grove, Ill., assignors to International Harvester Company, a corporation of New Jersey**
**Application February 24, 1955, Serial No. 490,173**
**6 Claims. (Cl. 214—519)**



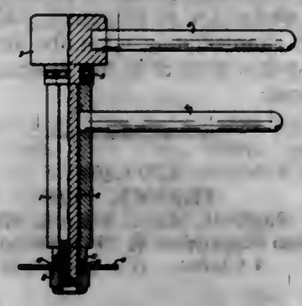
1. A self-unloading vehicle comprising a box, a bed conveyor on the bottom of the box having first and second discharge ends, a transverse conveyor on the bottom of the box disposed in receiving relation to said first discharge end of said bed conveyor and discharging through an opening in the side of the box, and a stripper elevator conveyor carried between the sides of the box and having a lower pick-up end spaced above said bed conveyor between said first and second discharge ends and defining a limited load passage space therebetween, said stripper elevator conveyor having an upwardly running rectilinear stretch facing into the box and terminating in an upper discharge end disposed in substantially vertically aligned and discharging relation to said transverse conveyor whereby a portion of the material is adapted to be discharged over said stripper elevator conveyor and a portion beneath the stripper elevator conveyor.

**2,771,204**
**LIFTING FORK FOR STACKED ARTICLES**
Francis A. McCormick, Toledo, Ohio, assignor to Owens-Illinois Glass Company, a corporation of Ohio
Application June 8, 1955, Serial No. 513,995
3 Claims. (Cl. 214—655)



1. A lifting fork comprising a supporting frame, a movable frame mounted for up-and-down movement relative to the supporting frame, lifting arms carried by the movable frame and extending horizontally forward therefrom, gripper bars carried by said arms and extending lengthwise thereof, the gripper bars comprising pairs individual to the lifting arms with the gripper bars of each pair positioned at opposite sides of the arm, slide bars extending lengthwise of the arms and mounted between the gripper bars, parallel links between the gripper bars and the slide bars including pairs of links individual to the gripper bars each link being pivotally connected at one end to its gripper bar and pivotally connected at its opposite end to the lifting arm, and means providing operating connections between the links and slide bars including coil springs and slidable frames, one link of each said pair being formed within an extension engaging one of said slidable frames, the springs being interposed between the slidable frames and slide bars, thereby providing a yielding connection by which the gripper bars when in article gripping position are yieldingly held against the articles, said springs permitting continued movement of the slide bars after the gripper bars are arrested by contact with said articles.

**2,771,205**
**CLOSURE MEMBER**
Nathan Zepelovitch, New York, N. Y., assignor to Nahum A. Bernstein, New York, N. Y.
Application December 11, 1951, Serial No. 260,980
4 Claims. (Cl. 215—52)



3. A reusable metallic closure member for containers having a predetermined internal neck diameter, a predetermined locking ring diameter and contoured locking ring area comprising an outwardly flanged and substantially horizontally disposed upper portion sized to outwardly terminate at a location adjacent the extent of said locking ring diameter, an integral frusto-conically shaped resilient body portion of substantially uniform thickness sized to pressure fit internally within the neck of said container and within the locking ring area thereof, an integral elastically deformable bottom portion concavo-convex in shape over at least a portion of its extent in such a manner as to be downwardly convex and upwardly concave, and a thin film of resilient deformable plastic material disposed at least on the container contacting surface of said body portion, said body portion, deformable bottom portion and thin film of plastic material thereon being sized so as to have an external diameter in undeformed condition greater than the internal neck diameter of the container and said metallic material being of a character so that longitudinal elastic depression of said bottom portion cooperatively effects a radial elastic deformation of said body portion sufficient to permit insertion of said body portion within the neck of the container within the locking ring area thereof.

**2,771,206**
**MACHINES FOR BUNDLING COMPONENTS**
Richard W. Daniels, Wenham, Hammond P. Diggle, Hamilton, and Bruce N. Smith, Essex, Mass., assignors to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application October 18, 1954, Serial No. 463,022
16 Claims. (Cl. 216—9)

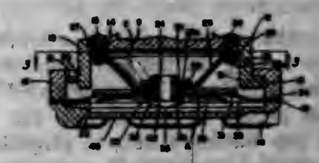
1. A machine for bundling components having coaxial leads comprising means engageable with the leads for conveying a succession of said components in spaced side by side relation along a path, a guide block extending in said path and adapted to maintain the bodies of said components in a straight row as they are fed by said means, and taping means arranged adjacent to the ends of the leads progressively to bind them, said taping means respectively including a folder for successively receiving the end portions of the leads to envelope them in a longitudinal fold of the tape being applied.

**2,771,207**
**CLINCH NUT SPINNING TOOL**
Fred D. Ott, Boalsburg, Pa., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application May 20, 1954, Serial No. 431,070
1 Claim. (Cl. 218—38)

A spinning tool for affixing an internally threaded element to a support which has a preformed hole to contain a circular flange projecting through the hole from said element; said tool consisting of a thread course to be screwed into the internal thread of said element, a handled rod of which the thread course is a part, said rod having a head, a handled sleeve revoluble on the rod and having one end thereof in bearing support confronting said head, and a forming structure at the other end of the sleeve, said structure comprising a diametrically opposed pair of convexly rounded projections the end surfaces of which are shaped to produce concavities

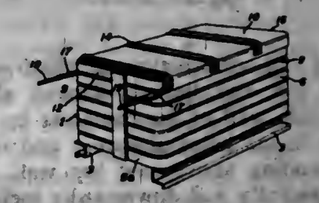
therein and are inclined both forwardly and inwardly for engaging the inner edge of said flange to expand and upset said flange pursuant to turning of the rod and sleeve relative to said threaded element.

**2,771,208**
**PAINT CAN EXTENSION COLLAR**
Joseph Chovanec, Hazleton, Pa.
Application June 9, 1955, Serial No. 514,281
4 Claims. (Cl. 220—4)



1. A paint can extension collar comprising a flat rectangular strip bent into a substantially cylindrical configuration upon bringing the free ends thereof together, means for securing said free ends together in adjustable relationship to fit paint cans of varying size, means for mounting the lower edge of said strip on the open upper end of a paint can or the like, means for imparting rigidity to the upper edge of said strip, and unitary means for preventing spillage through the collar and for limiting the downward displacement thereof through the paint can, said adjustable locking means comprising said strip at one free end thereof having a pair of laterally spaced, longitudinally extending elongated slots, said strip at the other end thereof having a pair of oppositely disposed laterally extending slots defining a pair of tongues bent through said elongated slots across the outer face of said strip whereby to slidably connect the free ends thereof and to adjust the cylindrical formation to paint cans of varying size as well as permitting the strip to be shipped in knockdown condition.

**2,771,209**
**ASH TRAY**
John B. Flynn, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application August 2, 1951, Serial No. 239,943
3 Claims. (Cl. 220—18)



3. An ash tray comprising a frame having a receptacle receiving opening provided therein, a receptacle positioned in said opening, cooperating trunnion means on said receptacle and said frame for permitting said receptacle to swing into and out of said openings, a substantially cylindrical cover having the forward side thereof secured to said frame adjacent said opening to position said cover substantially concentric with said bearing means, forwardly tapering projections extending circumferentially along the opposite ends of said cover away from said forward side to form a pair of wear receiving surfaces, each of said projections terminating adjacent the rear side of said cover to form shoulder means, said receptacle having members projecting therefrom to slidably engage said wear receiving surfaces during movement of said receptacle into and out of said opening, said members being positioned to engage said shoulder means when said receptacle is in the fully closed position, a recess extending circumferentially along the center of said cover between said tapered projections, a stop extending from said cover into said recess adjacent said frame, said cover having slots extending axially inwardly from each of said ends towards said recess, said slots being positioned adjacent said forward edge and between said wear receiving surfaces and said frame, and a resiliently deflectable detent on said receptacle projecting into said recess in spaced relation to said cover and being positioned to normally engage said stop when said receptacle is in the fully opened position, said detent being adapted when depressed to permit said receptacle to swing out of said opening and be lifted clear of said trunnion means.

**2,771,210**
**SAFETY CAPS FOR AIRCRAFT FUEL TANKS**
Owen H. Griswold, Paramus, N. J.
Application May 5, 1953, Serial No. 353,215
10 Claims. (Cl. 220—40)

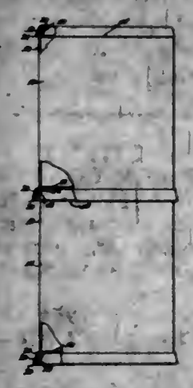
9. In combination with an adapter or filler neck having a radially-inwardly extending flange defining a filler opening of substantial diameter, the lower edge of said flange providing a seat, a safety cap comprising a housing removably secured to said adapter, a hollow pin disposed centrally of said housing, a member encircling said pin and having sealing means secured to the periphery thereof, means supporting said member, a flexible diaphragm supporting said last-named means, and means resiliently supporting said pin, member, supporting means and diaphragm to cause said sealing means to engage said seat, said hollow pin having a passageway therethrough communicating the space above said member with the space below said diaphragm, whereby pressure from said first-named space may be transferred through said pin to the lower surface of said diaphragm, said housing being rotatable relatively to said member, whereby to permit rotation of the housing without rotating said member or sealing means.

**2,771,211**
**SLIDE COVER FOR CONVERTING A BOX INTO A FEED HOPPER**
George Schrader, Sr., deceased, late of Waukegan, Ill., by George Schrader, Jr., administrator, Waukegan, Ill., assignor to United States Steel Corporation, a corporation of New Jersey
Application February 9, 1954, Serial No. 409,084
8 Claims. (Cl. 220—41)

1. A container and hopper unit comprising a box having a bottom with upwardly projecting side and end walls defining an opening at its top, said side walls each having a groove spaced from and parallel to its upper edge, a closure for said opening having lateral edges projecting beyond said sidewalls and flanges depending from said edges, and a pair of rods respectively secured to the inner surfaces of said flanges, each of said rods be-

ing received in and having sliding engagement in one of said grooves and mounting said closure for movement to and from a position covering said opening, said rods having extensions which project beyond one of said end walls when said closure is in its said covering position and are effective to actuate said closure to a position partially uncovering said opening when it is placed endwise on a supporting surface with said one end wall resting on said supporting surface.

---



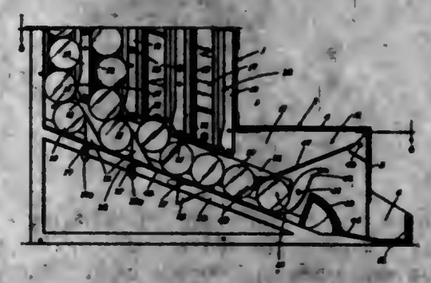
**2,771,212**
**ROCKET POWER UNIT**
William L. Ellinger, Jr., Glen Cove, N. Y.
Application February 8, 1955, Serial No. 486,752
6 Claims. (Cl. 102—34)

3. In a jet rocket power unit for a model airplane, a cylindrical case having an integral dome-shaped closure at its front end, said case being adapted to receive a cylindrical fuel pellet, a cap closing the rear end of said case, said cap having a central projecting nozzle, a spring yoke extending across said cap, said yoke having an opening fitting over said nozzle and diametrically opposite resilient arms projecting beyond the periphery of said cap and a U-shaped wire clip comprising a curved central portion engaging the front end of said case, and integral leg portions extending rearwardly along opposite sides of said case with its ends affixed to the arms of said yoke, said clip cooperating with said yoke to hold said cap resiliently on said case.

---

**2,771,213**
**STACKING CAN**
James R. Lewis, Brayton, Iowa
Application November 25, 1953, Serial No. 394,309
1 Claim. (Cl. 220—97)

In a stacking can construction, a cylindrical container provided with top and bottom flanged closure walls secured to the side wall of the container by double fold seams, the top flange being inwardly and upwardly inclined and extending above said top wall, the bottom flange being outwardly and downwardly inclined and extending below said bottom wall, the inclination of the top flange being the same as the inclination of the bottom flange and the exterior diameter of the top flange being the same as the interior diameter of the bottom flange to facilitate the stacking of a series of cans, said flanges each comprising an extension of the cylindrical wall of the container overlapped by a reverted double fold of a corresponding flange of its associated top or bottom wall.



**2,771,214**
**DISPENSING CARTON FOR PACKAGE STRIPS**
Frank J. Lefebvre, Caldwell, N. J., assignor to Ivers-Lee Company, Newark, N. J., a corporation of Delaware
Application September 14, 1953, Serial No. 379,920
6 Claims. (Cl. 221—25)

1. A dispensing carton for a flexible package strip that has commodity-containing compartments forming protuberances spaced longitudinally thereof and is severable between said compartments, said carton having walls forming a storage chamber for a plurality of layers of said package strip with two of said walls meeting at an angle and providing a discharge opening at the zone of intersection of said walls through which said package strip must move longitudinally out of said chamber, one of said walls having a hole through which a member may be inserted for pushing said strip through said discharge opening, and a guide-support within said chamber having a wall which underlies the first-mentioned wall beneath said hole and has a guide opening at the opposite side of said hole from said discharge opening through which said strip must pass from said chamber and between said guide support and the first-mentioned wall, there being a guide lip connected at one end to said wall of the guide support at the edge of said guide opening over which said package strip must slide during its movement from the chamber to said discharge opening, said guide lip extending from said guide opening toward said discharge opening with its free edge adjacent to the inner edge of said hole, said guide lip normally being biased toward said top wall thereby pressing said package strip against said inner edge of said hole and applying friction to the package strip to restrain accidental movement of the strip into and out of the carton.

---

**2,771,215**
**CONTAINER VENDING MACHINE**
John E. Oppenorth and Hazel M. Hanson, Los Angeles, Calif.
Application November 24, 1952, Serial No. 322,282
3 Claims. (Cl. 221—251)

1. A dispensing machine, for cylindrical containers, comprising, with a cabinet, an inclined chute for a longitudinal row of transversely disposed containers, a magazine assembly above the chute rearwardly of the lower end of the latter adapted to feed containers into said row, a container receiving trough in front of said lower end of the chute, said trough opening exteriorly of the cabinet, a controlled cross shaft above the lower end of the chute, an S-shaped rotary feeder on the shaft adapted, upon turning of the latter in a predetermined direction, to engage, lift, and discharge forwardly over the shaft the lowermost container of the row, and means spacing the lowermost container of the row from the next container thereof, said container spacing means comprising a longitudinal, downwardly urged but upwardly yieldable swing arm extending above and from ahead of the lowermost container to adjacent the rear thereof, and a down-turned tip on the rear of said swing arm normally engaging said adjacent container from the front, spacing the same from said lowermost container; the swing arm being swung upward and then released downward, upon dispensing of said lowermost container, whereby to permit forward travel of the row and movement of said adjacent container to the lowermost position on the chute; the feeder including diametrally opposed arms each arranged to engage and hold back said adjacent container when one arm is lifting said lowermost container until after the swing arm has been released by the container being dispensed.

---

**2,771,216**
**PAPER CUP DISPENSING CARTON**
George Reiner, New York, N. Y.
Application January 23, 1953, Serial No. 332,858
3 Claims. (Cl. 221—302)

1. For use with a plurality of cups which taper upwardly and have rims on their upper ends, said cups being nested in a stack, a shipping and dispensing carton comprising an elongated body adapted to house a stack of such cups and having a closure flap forming the lower end wall thereof, and on which the bottom of the lowermost cup in the stack is adapted to seat, said end wall having a removable section of a diameter at least slightly greater than the diameter of the tops of the cups so that the cups can pass downwardly through the end wall as they are being dispensed, and a tubular dispensing element freely positioned in the carton and adapted to surround the lowermost cups in the stack, the walls defined by said tubular dispensing element being downwardly and defining a minor lower end and a major upper end, said upper end being of an external diameter greater than the diameter of the removable section and said minor end being of a lesser external diameter than the diameter of the removable section so that it can pass downwardly through the end wall and protrude slightly therebelow, said minor end being resilient and having an internal diameter which is slightly less than the external diameter of the upper ends of the cups.

---

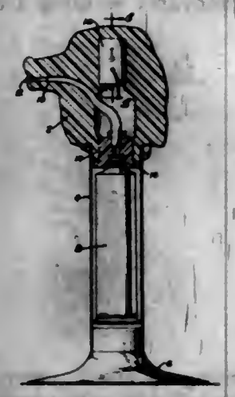
**2,771,217**
**MEASURING AND DISPENSING DEVICE**
James W. Brown and Robert L. Weintraub, Frederick, Md., assignors to the United States of America as represented by the Secretary of the Army
Application July 20, 1953, Serial No. 369,257
8 Claims. (Cl. 222—43)
(Granted under Title 35, U. S. Code (1952), sec. 266)

5. A measuring and dispensing device comprising a cylinder having an axial passageway, means for removably securing a delivery tip in the lower end of said passageway, an ejecting piston mounted in said passageway, an internally threaded portion in the upper end of said passageway, an external threaded portion on said ejecting piston cooperating with said internally threaded portion, an inwardly extending annular shoulder in said passageway below said threaded portions, a vent leading from said passageway above said shoulder, a removable bushing in said passageway below and abutting said shoulder, a collar threaded in said passageway below and abutting said bushing, a smoothly cylindrical piston portion on said ejecting piston extending past said shoulder and into said bushing, said bushing having a bore the upper portion of which is in fluid-tight engagement with said piston; said means for removably securing a delivery tip in said

lower end comprising an elastic compressible ring abutting the lower side of said collar, and a plug for compressing said elastic ring against said collar, said plug having a central aperture to receive the delivery tip; a control knob on the upper end of said piston. and cooperating detent means on said knob and cylinder constructed and arranged to detain said knob at a plurality of evenly divided points during rotation thereof.

---

**2,771,218**
**CLOSURE ASSEMBLY**
Edward Henderson, Montclair, N. J.
Application May 19, 1954, Serial No. 430,827
7 Claims. (Cl. 222—83)

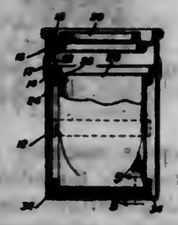


1. A container closure assembly comprising: a container having an externally threaded tubular dispensing nozzle with a dispensing aperture extending therethrough; a diaphragm made from a non-shattering relatively soft fluid impervious material extending across the dispensing aperture in the nozzle to seal the same; an internally threaded removable closure cap engageable with the threaded nozzle to close the same, the said cap having a completely enclosed top portion serving as a sealed closure for said container and said closure cap having a piercing plug depending downwardly from the top of the cap and engageable with the diaphragm to pierce the same when the cap is fully applied but being spaced from the diaphragm when the cap is only partially applied; and frangible stop means between the cap and container and connected to one of said parts and being engageable with the other part when the cap is only partially applied to limit the further application thereof, said stop means being frangible so as to break when sufficient torque force is applied to the cap in the direction of further application of the cap whereby the cap can be fully applied and the diaphragm pierced.

---

**2,771,219**
**INTEGRATED HOLDER AND DISPENSER**
Roberta L. Dewey, New York, N. Y.
Application December 28, 1954, Serial No. 478,114
1 Claim. (Cl. 222—93)

A device of the type described comprising a dispensing member of artistic configuration, a hollow stem of elastic

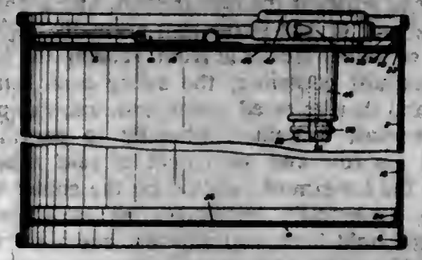


material attached thereto and designed to receive a compressible tube containing a fluid substance to be dispensed, a plug between the dispensing member and the hollow stem and having a passage therethrough screw threaded at the end adjacent the stem to receive the screw threaded end of the toothpaste tube, a passageway extending

through the dispensing member from the passageway in the plug to a discharge orifice in the dispensing member, and one or more retractable cords mounted within and extending through the wall of said dispensing member and carrying implement connecting means at their ends outside of said member.

---

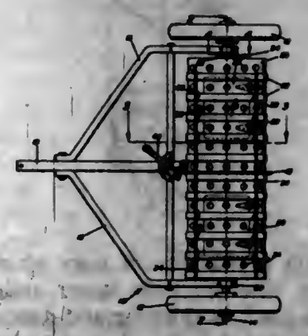
**2,771,220**
**CONTAINER WITH ROLLER TYPE COLLAPSIBLE TUBE**
**Louis Clapa, Levittown, N. Y.**
**Application June 16, 1954, Serial No. 437,109**
**3 Claims. (Cl. 222—100)**



1. An adjustable container comprising a lower outer receptacle, an upper outer receptacle, means supporting said upper outer receptacle with a portion of said upper outer receptacle extending into said lower outer receptacle, an inner receptacle carried by said upper outer receptacle within said lower outer receptacle, said inner receptacle comprising a collapsible tube, and a cover engaging said upper outer receptacle to seal said container, said upper outer receptacle having a hook-like flange extending about the lower peripheral edge thereof, said inner container having an upper flange engaging said hook-like flange.

---

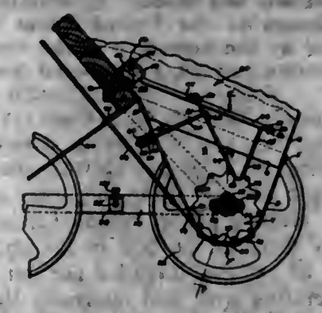
**2,771,221**
**LIQUID CONTAINER**
**Cecil Featherstone Hammond and William Shackleton, London, England, assignors of one-half to Lining Components Limited, London, England, a British company; said Cecil Featherstone Hammond, administrator of said William Shackleton, deceased**
**Application January 2, 1953, Serial No. 329,334**
**6 Claims. (Cl. 222—111)**



1. A drum for the transport and storage of liquid comprising a sheet metal shell, including a body, a head and a bottom, in combination with a lining in the form of a bag of flexible material, said shell being formed with an opening, and said bag including a tubular part integral with said bag and aligned with said opening and adapted

to be completely inverted through said opening to form a spout and to be returned through said opening.

---



**2,771,222**
**LIME SPREADER**
**Herman Orne, Pepin, Wis., assignor of thirty-three and one-third percent to Donald Orne and thirty-three and one-third percent to Wilbur Orne, Pepin, Wis.**
**Application August 11, 1953, Serial No. 373,481**
**2 Claims. (Cl. 222—171)**

2. A spreading device for finely ground material comprising a mobile support frame, a cylindrical drum mounted on said frame for rotation, means providing access to the interior of the drum for replenishing the supply of material being spread, means for rotating said drum, said drum having a plurality of apertures in the wall thereof with the apertures being disposed in longitudinally spaced circumferential rows for discharging the material, a plurality of rings encircling said drum and disposed for longitudinal sliding movement thereon, one of said rings being disposed adjacent each row of apertures for sliding movement into overlying relation to the adjacent row of apertures for controlling the flow of material from the drum, means rigidly interconnecting the rings for assuring simultaneous movement thereof, and means adjacent the center of said drum for simultaneously moving the rings in either direction.

---

**2,771,223**
**LINE MARKING MACHINE**
**Herl J. Ryan, Los Angeles, Calif.**
**Application August 10, 1953, Serial No. 373,135**
**9 Claims. (Cl. 222—177)**

1. In a line marking apparatus: a hopper provided in its bottom with a discharge opening; a wheeled support carriage including a shaft extending transversely through said hopper and caused to rotate by the travelling movement of the carriage; and agitating mechanism comprising an agitator rotor of open squirrel-cage form, including a plurality of circumferentially spaced bars parallel to said shaft, said rotor being mounted on said shaft and secured thereto for rotation therewith, whereby said bars will sweep across said discharge opening for clearing the same; a vertically reciprocable agitator including a carrier pivoted in the hopper rearwardly of the rotor and extending forwardly thereover, and a downwardly projecting forward end part riding on the periphery of said rotor and adapted to be alternately lifted by successively passing bars of said rotor and dropped into successive spaces between said bars so as to agitate material within said hopper in a manner to feed it downwardly through said rotor while inhibiting packing of the material within the rotor and spring means connected between said lower end part and the rear wall of said hopper and exerting a downward pull on said carrier to cause it to strike the succeeding rotor bars with spring energized impact.

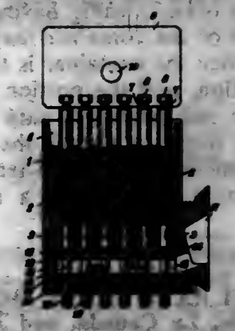
**2,771,224**
**HAND CARRIED LIQUID DISPENSER**
**Earl Arthur Boerger, South Jacksonville, Fla.**
**Application February 15, 1955, Serial No. 488,253**
**9 Claims. (Cl. 222—210)**



4. A dispenser for liquids comprising a container having a substantially flat side arranged to be mounted against and engage the back of the hand of a user; an elongate passage means connected with the flat side of said container and providing an orifice, said means extending laterally from the said flat side a distance commensurate with the thickness of the fingers and being adapted to extend between the fingers of the hand, said means further having a flexible and deformable normally-closed valve which opens in response to lateral pressure on and deformation of it; fastening means attached to said container, for attaching the same to the back of the hand, said container having deformable walls, and said fastening means tending to collapse the said walls and eject the contents of the container therefrom, said fastening means comprising an elastic band encircling the hand and secured to an outer wall of the container, tending to collapse the same; and means for adjustably securing the band to the said outer wall to regulate the tension of the band as the container empties.

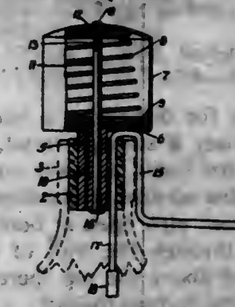
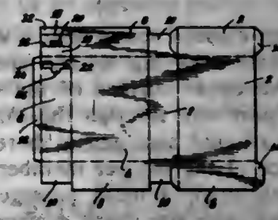
**2,771,225**
**PUMP CONSTRUCTION FOR CANDY DEPOSITING MACHINE**
**George S. Perkins, New York, N. Y., assignor to National Equipment Corporation, New York, N. Y., a corporation of New York**
**Application June 17, 1955, Serial No. 516,076**
**6 Claims. (Cl. 222—255)**



1. In a pump construction, a housing provided with a plurality of cylinders, each cylinder having a bottom discharge opening, a piston mounted for reciprocating movement in each cylinder, an outlet nozzle located below each cylinder discharge opening, a slidable hollow cut-off bar mounted in the housing between the cylinder discharge openings and the outlet nozzles, said cut-off bar having an upper wall provided with a plurality of openings all of which communicate with the hollow interior of said cut-off bar, said openings being adapted, when the cut-off bar is in a predetermined position, to establish communication between the cylinder discharge openings and the hollow interior of the cut-off bar, the cut-off bar having a plurality of tubular passages extending through it without communicating with the hollow interior of said

bar, said tubular passages being adapted to establish communication with the cylinder discharge openings and the outlet nozzles when the cut-off bar is moved to a position wherein the cylinder discharge openings are disaligned with the openings in the upper wall of said cut-off bar.

---



**2,771,226**
**UNIVERSAL LIQUID DISPENSER**
**Lawrence G. Bates, Shaker Heights, Ohio, assignor to Continental Say-When Corporation, Cleveland, Ohio, a corporation of Ohio**
**Application November 8, 1952, Serial No. 319,541**
**5 Claims. (Cl. 222—401)**

1. In a liquid dispenser having a pump supported on a closure for a container opening and a discharge tube in such closure which communicates between liquid in the container and a point of discharge outside, guide means for the pump relative to the closure, finger-controlled means for admitting air from outside into the pump, and means for admitting pressure air from the pump into the container and for retarding the rate of flow from the container to the pump embodiying a continually open helical connecting passageway.

---

**2,771,227**
**CARTONS**
**Anthony A. Urbina, New York, N. Y.**
**Application December 14, 1954, Serial No. 475,220**
**4 Claims. (Cl. 222—455)**

1. A container of the class described having front and rear walls, side walls, and top and bottom walls, said top and bottom walls being formed of overlying flaps on the ends of the front, rear and side walls, the flap on the upper end of one of the side walls being bent on a line

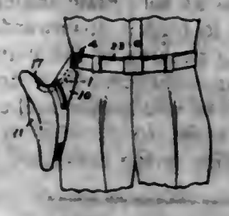
spaced a distance from its inner end to form a downwardly inclined baffle having its upper end spaced from the side wall and its lower end secured to said side wall, said baffle, the opposite portion of said side wall and the inner portion of said flap forming a measuring pocket, the upper end portion of said baffle having a slot through which the contents of the container may flow by gravity into said pocket when the container is tilted downwardly to a suitable position, and the portion of the side wall opposite the lower end portion of said baffle being provided with a slot so as to permit the contents of the pocket to flow from the container when the container is tilted in the opposite direction to a suitable position.

---

**2,771,228**
**CONSTANT RATE LIQUID DISPENSER**
**Thomas A. Dobbie, La Canada, and John B. Sturgess, San Gabriel, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California**
**Application February 12, 1954, Serial No. 409,860**
**8 Claims. (Cl. 222—481.5)**

1. An apparatus for dispensing a liquid at a constant rate which comprises a storage vessel, an inlet means opening thereinto for liquid, a lower outlet means opening therefrom, a flow control orifice disposed in said outlet means, and a vent pipe open at both ends and sealed at and extending through the wall of said vessel from a point outside and above the top thereof to a point inside and adjacent the bottom thereof.

---

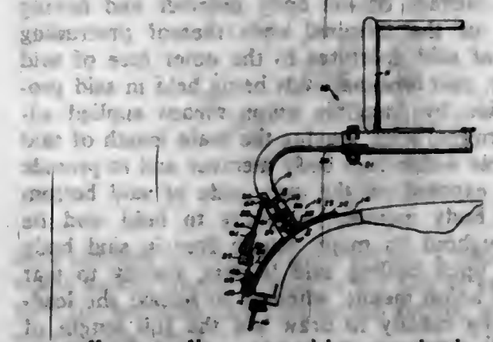


**2,771,229**
**POURING SPOUT**
**Widmer C. Sidenius, Sandy Hook, Conn., assignor to Production and Marketing Company, Newtown, Conn., a partnership**
**Application December 27, 1954, Serial No. 477,721**
**8 Claims. (Cl. 222—484)**

1. A container closure comprising a stopper member, said stopper member having an air passageway therein opening onto the upper surface of the stopper member and continuing part way through the same, said stopper member having a liquid passageway therein opening onto the lower surface of the stopper member and continuing part way therethrough, a main passageway connecting the upper surface with the lower surface of the stopper member and intersecting the liquid and air passageways, a rotatable dispensing tube member within the main passageway and sealing the same, said tube member having a partition intermediate its ends dividing it into an upper portion and a lower portion, opening adjacent this partition in both the upper and lower portions of the tube, said upper opening registering with the liquid passageway and said lower opening registering with the air passageway when the tube member is in the open position, and said openings being sealed by the stopper member when the tube member is rotated into the closed position.

---

**2,771,230**
**HAT HANGER AND IDENTIFYING MEANS FOR HAT**
**Henry Fitzpatrick, Hayward, Calif.**
**Application April 12, 1954, Serial No. 422,325**
**3 Claims. (Cl. 224—5)**

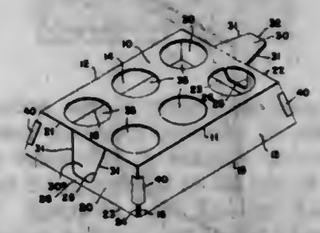


1. A hat hanger for a visor type hat having an emblem over the visor with an emblem post extending through said hat above said visor and into a space above said visor and above the head of a wearer comprising: a substantially V-shaped clip providing a pair of spaced opposed legs, a member formed with an opening adapted to pass said emblem post therethrough, an elongated uniformly wound helical spring extending from said clip to said member and secured at one end thereof to one leg of said clip and at the other end to said member with said spring terminating at its ends substantially at said clip and member whereby said member is adapted to yieldably flex uniformly in any desired direction at any point along its length under a bending force applied to said spring, said spring being relatively short with its adjacent coils in engagement with each other when said spring is collapsed, to enable it to fit within said space above the head of the wearer of such cap and the length of said spring being sufficient to enable sufficient expansion of said spring to permit full withdrawal of said clip from said cap and past its visor where said member is secured to said post, said close engagement of said adjacent coils of said spring providing a support for holding said spring substantially straight when supported horizontally from one end only, said clip being a flat piece of material with said spring pivotally connected to said one leg to enable said clip to swing relative to said spring to different positions, and the outer side of said other leg providing a flat surface adapted to carry the name of the wearer of the hat, said legs being spaced for receiving the visor of such hat therebetween at any point along the edge of the latter with said outer side at the upper side of such visor.

---

**2,771,231**
**CAR TOP LUGGAGE CARRIER STRUCTURE**
**Terence G. Hare, Detroit, Mich., assignor to Miller Manufacturing Co., Detroit, Mich., a corporation of Michigan**
**Application November 10, 1954, Serial No. 467,952**
**5 Claims. (Cl. 224—42.1)**

1. A structure for mounting a luggage carrier having a downwardly extending supporting leg, on the top portion of an automobile body comprising, a plate adapted to rest upon the top portion of the automobile body, two projections extending upwardly from the plate and spaced from each other in a fore and aft direction with reference to the automobile, a pair of matching connector plates, the lower edge of each connector plate having a first concavity extending generally horizontally and constituting substantially one-half of a bearing, the central part of each plate having an upwardly extending concavity constituting substantially one-half of a socket, said connector plates being disposed in interfacial relationship with the matching first concavities constituting a bearing, the lower edges of the connector plates positioned between the projections on said plate, a pintle member passing through said projections and said bearing, the matching



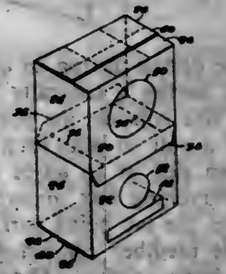
upwardly extending concavities constituting a socket, the downwardly extending supporting leg being disposed in the socket, means for securing the two connector plates together, and tightening means interposed between the downwardly extending supporting leg and a portion of the automobile body for holding said plate against the top of the automobile body.

---

**2,771,232**
**STACKABLE SERVICE TRAY**
**Kenneth M. Read, Swarthmore, Pa.**
**Application August 4, 1953, Serial No. 372,219**
**1 Claim. (Cl. 224—48)**

A single service multiple purpose disposable stackable tray comprising a one piece construction of thin flexible sheet material having a central plane panel with a plurality of spaced cup receiving openings therein for the reception and retention of cups on one side thereof, a pair of oppositely spaced side panels having terminal edges, each of said side panels being joined to said central panel by a longitudinal crease line and extending outwardly and downwardly from said central plane panel, each of said side panels diverging from said longitudinal crease line and being substantially trapezoidal in shape, a pair of oppositely spaced end panels having terminal edges in the same plane as said first mentioned terminal edges, each of said end panels being joined to said central panel by a transverse crease line and extending outwardly and downwardly from said central plane panel, each of said end panels diverging from said transverse crease line and being substantially trapezoidal in shape, a flexible handle portion at each end of said central panel centrally disposed with respect thereto, each of said handle portions being in the same plane as an end panel and each of said end panels having an opening corresponding in size to the handle portion located in the same plane therewith, the flexible handle portions being adapted to be bent substantially at the transverse crease lines to rest in the same plane as said central panel, said side panels and said end panels being secured at their meeting margins, said side and end panels providing supports for the central panel and said tray being adapted to receive like trays in stacked relation.

---

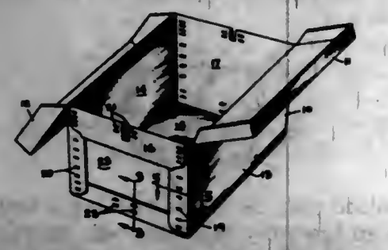


**2,771,233**
**MOLDED PULP CARTON**
**John W. Cox, Chicago, Ill., assignor, by mesne assignments, to The Diamond Match Company, New York, N. Y., a corporation of Delaware**
**Application June 21, 1950, Serial No. 169,460**
**20 Claims. (Cl. 229—2.5)**

1. A molded pulp carton comprising a bottom section defined by an upwardly extending wall structure and provided with a plurality of contiguous article receiving cells successively arranged in row formation, said cells having lowermost egg supporting portions defined at least in part by relatively flat walls which flare outwardly and upwardly at a predetermined angle to the vertical and merge at their topmost limit into upper egg restraining portions disposed at a lesser angle to the vertical, successive cells in a row being merged with one another substantially beneath the top of said wall structure and at the approximate elevation of the merger of said lower and upper cell portions.

---

**2,771,234**
**MULTI-SECTIONAL CONTAINER**
**Oscar H. Hultin, Quincy, Mass., assignor to Pneumatic Scale Corporation, Limited, Quincy, Mass., a corporation of Massachusetts**
**Application March 8, 1952, Serial No. 275,545**
**7 Claims. (Cl. 229—15)**

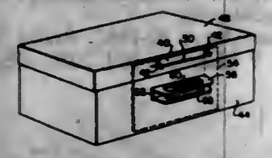


1. A package comprising a multi-sectional container comprising a plurality of duplicate sections, each section comprising a carton having two side panels, two end panels and a bottom closure, each of said end panels having inwardly folded short top flaps and one side panel only being extended beyond the top of the section to form a securing flap, two of such sections being assembled with the inwardly folded short end panel flaps of one section engaging and adhesively secured face to face with the corresponding flaps of the second section, each section being filled with a commodity and having a top closure to retain the commodity within each section, the side panel flap of each section being adhesively affixed to the exterior of the body of its opposing section, and the securing flap of one section forming a hinge upon which the opposed section may be swung to open the tops of both sections after the securing flap of the other section has been completely severed between the two sections.

---

**2,771,235**
**REINFORCED CASE**
**Robert P. Stephenson, Grand Rapids, Mich.**
**Application July 11, 1949, Serial No. 104,021**
**3 Claims. (Cl. 229—23)**

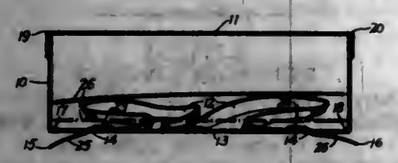
1. A rectangular container, comprising: side, end, and bottom wall panels of fibrous sheet material disposed to define enclosed space, said side and bottom panels having



flap portions disposed to overlap the marginal portions of the adjacent end panels along the normally vertical sides and the bottom of said ends; a plate of relatively hard material in face contact with an end panel and having its vertical edge portions interposed between said flaps and said marginal portions, said plate extending

from a point adjacent the top of said container to the bottom thereof and having a flange portion disposed to rest on said bottom panel; and fastening means disposed along said normally vertical sides outside the vertical edges of said plate and securing said flaps and marginal portions together and clamping said plate therebetween.

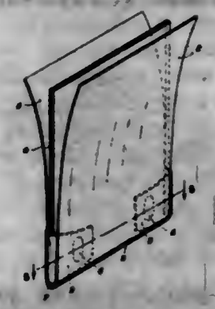
---



2,771,236
CARRYING PACKAGE
Clarence Lloyd Claff and Carl A. Moeller, Randolph, Mass., assignors to M. B. Claff & Sons, Inc., Randolph, Mass., a corporation of Massachusetts
Application October 14, 1953, Serial No. 386,033
1 Claim. (Cl. 229—45)

A portable shoe carton having an open-sided rectangular body portion having a centrally located slot and a securing tab in a side adjacent the open side, the securing tab consisting of a pair of slits each reaching the edge bounding the open side at an angle thereto and spaced to permit the intervening box material to be bent outwardly at an angle, the tab being narrowest adjacent said opening, a handle member consisting of a flat portion lying within the body portion adjacent said side and a handle projecting from the flat portion through said slot, and a cover having side walls joined at the edges and adapted to engage frictionally with the outer surfaces of the body walls, said cover having in a side wall a substantially straight slit adapted to receive said outwardly bent securing tab, the flat portion of the handle member extending substantially over the portion of the body side wall including the tab, and the tab having cuts adjacent said slits and substantially along the line of said bending to form end portions adapted to be bent in relation to the tab to lock the tab onto the cover.

---

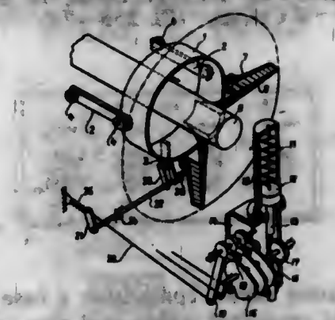


2,771,237
CARTON WITH TIE MEANS
Stanley J. Phillipson, Brooklyn, N. Y.
Application May 17, 1955, Serial No. 508,963
2 Claims. (Cl. 229—46)

1. A prepared shoe package member comprising polygonal side and bottom walls joined into a set-up box body and having a conforming cover member adapted to be tied thereto as a closure, a tie member of predetermined length to hold said cover member on said body member in position by knotting the terminal ends of the tie member to each other encircled about the body member and cover member, said body member having on the bottom wall two spaced apertures therein, said tie member lying on the inner surface of the body member and having one of each of the terminal ends thereof protruding through one of said apertures to the outer face of said body member, said terminal ends being held in said protruding position by frangible union means applied adjacent said terminal ends, leaving the main length of said tie member free within said body member and to provide short leaders exposed on the outer side of said bottom wall of said body member, whereby to hold said tie member throughout its major length free in said body member and upon pulling said leaders, readily to tear said frangible union means, whereby to release the leaders and thereby readily to draw out the full length of said tie member through the apertures, sufficient to encircle the body member and cover member, to permit joining the terminal ends into a knot, the apertures through which the tie member passes thereby serving as the sole anchoring means for the tie member.

---

2,771,238
PHOTOGRAPHIC PRINT FOLDER
Ralph W. Clarke, Nashville, Tenn., assignor to Double Envelope Corporation, Roanoke, Va.
Application June 25, 1954, Serial No. 439,299
1 Claim. (Cl. 229—87)



An open ended folder of relatively stiff paper comprising a blank folded transversely intermediate the ends thereof with a single sharp fold line to provide top and bottom like leaves in face to face contact, substantially square flat tabs extending from the opposite side edges of only one of said leaves adjacent said sharp fold line, one side of each tab being provided with a spot of adhesive and folded inwardly along a single fold line which has a length approximately one fourth the length of a leaf, each tab extending a distance substantially one third the width of said leaves and secured to the inner face of the other of said leaves by said adhesive adjacent said first mentioned fold line when said leaves are in folded or superimposed relation, whereby a V-shaped shallow pocket between the leaves is provided.

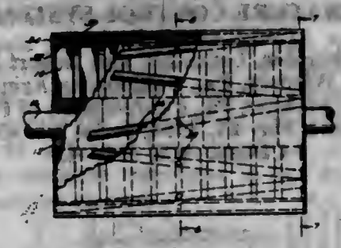
2,771,239
ARRANGEMENT FOR THE TRANSPOSITION OF A HOLLOW CYLINDRICAL SLIDE
Raymond Morellon, Zurich, Switzerland, assignor to Ateliers de Construction Oerlikon, Zurich-Oerlikon, Switzerland, a corporation of Switzerland
Application May 15, 1952, Serial No. 287,991
Claims priority, application Switzerland June 8, 1951
4 Claims. (Cl. 230—114)

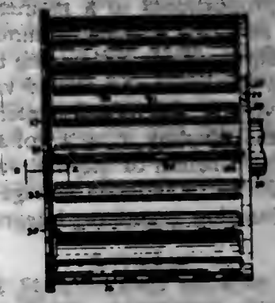


1. A compressor having the combination of a rotatable hollow wheel for receiving and impelling fluid, a shaft for carrying and driving said wheel, said wheel having an opening surrounding said shaft for suction intake of said fluid, a cylindrical shell concentric with and surrounding said shaft and movable axially into and out of said opening for regulating the extent of said suction, said

shell carrying a series of guide rollers, a housing for said wheel having tracks parallel to the axis of said shaft and shell for receiving and guiding said rollers, and means for moving said shell.

---

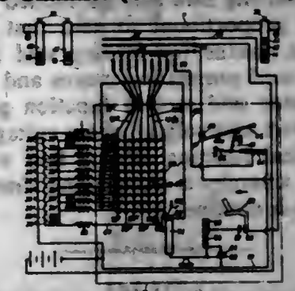
2,771,240
AUTOMATIC DYNAMIC BALANCER
Peter J. Gurin, Ardmore, Pa.
Application August 27, 1952, Serial No. 306,745
1 Claim. (Cl. 230—134)
(Granted under Title 35, U. S. Code (1952), sec. 266)



In combination with a multi-stage axial-flow gas turbine compressor having a plurality of sets of coaxially related blade assemblies, a housing enclosing the blade assemblies and being secured to the tips of the blades for joint rotation therewith, said housing having an inner wall and an outer wall concentrically related and slightly spaced about from one another to form an annularly shaped clearance therebetween, a plurality of tubes positioned in the clearance formed by the walls of the housing and each extending generally longitudinally of the compressor, said tubes at the same angle to one another and being so arranged that each tube cooperates with its neighbor on one side to form a V having its apex at one end of the housing and cooperates with its neighbor on the other side to form a V having its apex at the other end of the housing, said tubes being further arranged that at their mid-points they are equally circularly spaced around the axis of rotation of the compressor, and a ball in each tube and capable of rolling freely to assume positions therein during the rotation of the compressor acting to bring same into dynamic balance.

---

2,771,241
BLOWER WHEEL
Lowell Eugene Sprouse, Columbus, Ind., assignor to Vernco Corporation, Columbus, Ind., a corporation of Indiana
Application November 25, 1953, Serial No. 394,271
4 Claims. (Cl. 230—134)

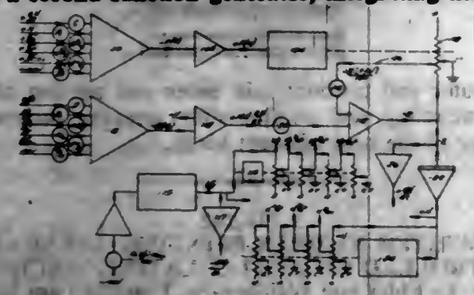


1. A blower wheel comprising a circular base plate; a plurality of blades extending normally and circumferentially of said plate; the outer end portion of each of said blades having a laterally entering notch traversing the blade to define an outer end portion extending across the blade approximately half the width of the portion leaving a neck; a finger extending laterally from each of said outer ends intermediate said notch and the outer end edge of the blade and lapping over the next adjacent

blade outer end portion; said outer end portion of one blade encircling and compressibly gripping therewithin the finger of the next adjacent blade.

---

2,771,242
TYPEWRITER NUMBER-PRINTING APPARATUS CONTROLLED BY A CALCULATING MACHINE
Leo Trnka Elder von Waldbergen, Frankfurt am Main, Germany
Application September 19, 1952, Serial No. 310,487
Claims priority, application Germany September 25, 1951
5 Claims. (Cl. 235—60.12)



4. Actuating mechanism for a typewriter including a movable carriage and a set of key elements, said actuating mechanism comprising, in combination, a circuit including a source of current; a set of electromagnetic operating means connected in parallel in said circuit, each electromagnetic operating means including a movable operating member connected to one of said key elements for actuating the same; a plurality of contact sets, each contact set connected in said circuit in series with one of said electromagnetic operating means, at least some of said contact sets being associated with denominational orders and including a shiftable contact for selecting a digit of the respective denominational order, said shiftable contact being adapted to be moved by the register means of a calculating machine; a set of fixed contacts located adjacent the typewriter carriage; a movable contact adapted to be secured to the typewriter carriage and cooperating with said fixed contacts for successively engaging the same during movement of the typewriter carriage, said set of fixed contacts and said movable contact being connected in said circuit; a set of blocking contact means connected in series in said circuit, each blocking contact means including a movable blocking contact member mechanically connected to one of said operating members and interrupting said circuit when the corresponding movable operating member is actuated.

---

2,771,243
APPARATUS FOR SIMULATING AN ENGINE
Louis Wolin, Philadelphia, and Arthur M. Carter, Jr., Rosemont, Pa.
Application September 3, 1952, Serial No. 307,725
3 Claims. (Cl. 235—61)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A computer device for simulating a dynamic system comprising an electrical system wherein there is pro-

vided a function generator for converting an input voltage proportional to a value of a first variable into an output voltage proportional to a mathematical function of the value of said first variable, summation means for receiving said output voltage and adding thereto a voltage proportional to a first value of a second variable to obtain a second output voltage, a divider for receiving said second output voltage and dividing it by a voltage proportional to a mathematical function of the first value of said second variable, said last mentioned voltage being obtained from a second function generator, integrating means for

receiving the output voltage of said divider, said last mentioned output voltage being proportional to a value of a third variable in the form of a mathematical differential, and converting said last mentioned output voltage into a voltage proportional to said first value of said second variable, means for feeding said last mentioned voltage both to said summation means and to said second function generator said second function generator being adapted to convert said voltage into a voltage proportional to a mathematical function of said first value to be fed to said divider, whereby a closed loop simulation of said dynamic system is obtained.

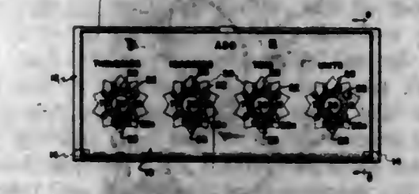
**2,771,244**

**CODED PULSE CIRCUITS FOR MULTIPLICATION**

François Henri Raymond, Le Vesinet, France, assignor to Societe d'Electronique et d'Automatisme, Paris, France, a corporation of France

Application April 23, 1951, Serial No. 222,385
Claims priority, application France May 3, 1950
8 Claims. (Cl. 235—61)



1. An operator circuit for binary-coded impulse trains, each having a fixed number of impulse periods, said operator circuit comprising: a static register for the digits of a binary quantity comprising a number of registering members equal to the number of the said impulse periods, a corresponding number of gates controlled by said members; a common application channel for all said gates; a delay transmitting channel; a plurality of taps distributed along said channel, the intervals between said taps being equal to the timing intervals of said trains, each of said taps being connected to the output of one of the said gates and the distribution of said taps along said channel being in registration with the distribution of the controls from said register to said gates; amplitude discriminators for accepting only amplitude levels greater than unity, each said discriminator having its input connected to one of said taps, with the exception of the first tap in the direction of transmission; pulse-cancelling devices coupled between the outputs of said amplitude discriminators and said same corresponding taps; and pulse carry-over devices coupled between the outputs of said amplitude discriminators and the taps in said channel which respectively immediately precede in time the said corresponding taps.

**2,771,245**

**CALCULATING DEVICE**

John T. Crowley, Atlanta, Ga.

Application May 16, 1955, Serial No. 508,586
6 Claims. (Cl. 235—74)

1. A calculating device comprising a case, a numeral wheel rotatably supported within said case, said numeral wheel being rotatable in a first direction to perform an addition operation and rotatable in the opposite direction to perform a subtraction operation, means adapted to permit manual actuation of said numeral wheel from either of the opposed side surfaces thereof, and a stop mechanism engageable with said numeral wheel to limit rotation of said numeral wheel to a clockwise direction with respect to the side surface of said numeral wheel employed for actuation.

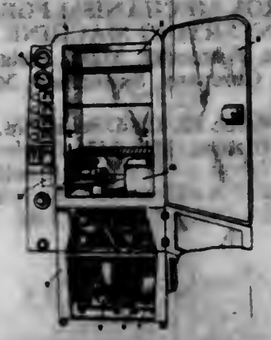
**2,771,246**

**TEMPERATURE CONTROL SYSTEM FOR CALENDER ROLLS**

Charles F. Schneider, Lancaster, and Robert D. Turkington, Lower Windsor, Pa., assignors to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

Application May 21, 1954, Serial No. 431,362
3 Claims. (Cl. 236—1)

1. In a device for controlling the temperature of the working surface of a calender roll, the elements comprising a system for circulating fluid through the interior of said roll, said circulating system being connected to a closed circulating loop carrying cooling fluid and a closed circulating loop carrying heating fluid; a thermocouple in engagement with the working surface of the calender roll; a potentiometer connected to said thermocouple; a pneumatic controller in combination with said potentiometer, the arrangement of the pneumatic controller and the potentiometer being such that the set point of the potentiometer corresponds to the center of the range of the pneumatic controller so that a variance of the temperature on the surface of the roll recorded on the potentiometer changes the strength of the pneumatic signal put out by the pneumatic controller; a pneumatic throttling controller, said pneumatic throttling controller controlling the flow of air through a pressure line; a valve on the cold fluid circulating system to control the amount of cooling fluid supplied to the circulating loop in the calender roll, the adjustment of said valve being controlled by the throttling controller which is in turn controlled by the signal from the pneumatic controller; and a pair of valves on the cold fluid loop and a pair of valves on the hot fluid loop, said valves being controlled by the pneumatic controller to close the one loop and open the other loop upon a temperature drop on the surface of the roll within a predetermined limit.



**2,771,247**

**CONSTANT HUMIDITY APPARATUS**

Henry L. Williams, Park Ridge, Ill., assignor to Food Technology, Inc., Chicago, Ill., a corporation of Illinois

Application April 4, 1952, Serial No. 280,677
3 Claims. (Cl. 236—44)

1. In a constant humidity chamber the combination with a chamber of a fan adapted to circulate air in said chamber, a spray nozzle arranged to discharge water into said fan for distribution of the water, means for supplying compressed air to said nozzle responsive to the impulse of a humidity-sensitive element in said chamber, said means being adapted to draw water to said nozzle when air is passed therethrough and intermittently operable mechanism operable in response to said impulse of said humidity-sensitive element for interrupting the operation of said first named means, said mechanism including a driven adjustable cam, a motor for driving said cam, and an electrical switch connected to said first named means for interrupting the operation thereof adapted to be actuated by rotation of said cam, said motor being operative responsive to said impulse of said humidity-sensitive element.

**2,771,248**

**HIGH CAPACITY THERMOSTATIC EXPANSION VALVE**

Edward C. Ehlke, Milwaukee, Wis., assignor, by mesne assignments, to Controls Company of America, Schiller Park, Ill., a corporation of Delaware

Application January 19, 1955, Serial No. 482,765
7 Claims. (Cl. 236—92)

1. A thermostatic expansion valve of large capacity in which the head pressure has little effect on the operating characteristics of the valve comprising, a valve body having an inlet and an outlet and a partition wall therebetween, an annular port in said partition wall, coplanar annular valve seats inside and outside the annular port on the outlet side of the port, a push pin passing centrally of the annular port through said partition, means including a diaphragm defining a variable volume chamber, means connecting said chamber to a feeler bulb subjected to temperature variations, a flat annular valve assembly on the outlet side of the port and adapted to seat on said annular surfaces, said push pin being operatively connected to said diaphragm and to said valve assembly, spring means acting on the valve assembly urging the valve assembly towards the annular seats, and means allowing communication between the center of the valve assembly and the outlet so that flow through the port when the valve is open can flow to the outlet either externally or internally of the valve assembly.

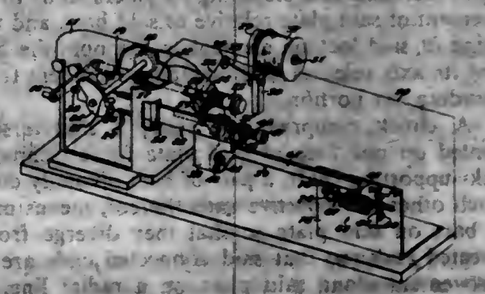
**2,771,249**

**SLIDE TRACK MOUNTING MEANS FOR DIFFERENT MESH SIZE SCREENS IN SCREENING MILLS**

Herman D. Schutte, Williamsville, N. Y., assignor to Schutte Pulverizer Company, Inc., Buffalo, N. Y.

Application March 29, 1955, Serial No. 497,631
6 Claims. (Cl. 241—89)

1. In combination, a mill including guide track means for mounting a screen in operative position thereon, and a screen magazine device comprising a plurality of guideways adapted to separately support a plurality of screens for interchangeable mountings thereof in said mill, said guideways including convergent portions for guiding the corresponding screens to a common point of discharge from the magazine into said mill, said magazine being pivotally connected to said mill, and lever means extended from said magazine and manually operable to swing the discharge portion of magazine toward and away from said mill.



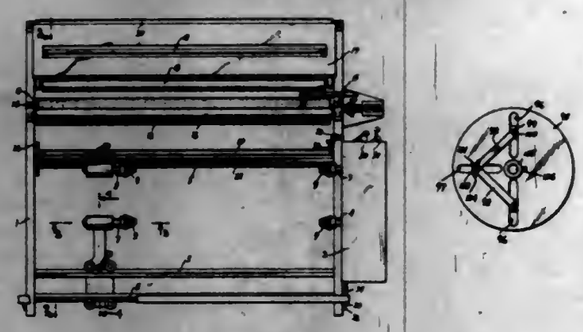
---

**2,771,250**

**CORRECTOR UNIT FOR A COIL WINDING MACHINE**

Phineas J. Icenbice, Cedar Rapids, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa

Application June 9, 1953, Serial No. 360,548
4 Claims. (Cl. 242—9)



1. A corrector unit for a coil winding machine comprising, a housing, a longitudinal shaft rotatably supported in said housing and adapted to receive a coil form, a slide arm supported by said housing for motion parallel to said shaft, a cam rotatably supported by said housing

and engaging said slide arm to move it relative to the housing, said cam rotating as a function of the rotation of said longitudinal shaft, a follow arm pivotally supported on one end of said slide arm, a wire guide slideably mounted on said slide arm in engagement with said follow arm, a cam member having a profile of adjustable configuration in a plane parallel to said shaft, said cam member being fixedly mounted on said housing, one end of said follow arm engaging said cam member, and said cam member varying the advance of said wire guide as a function of said guide's advance, whereby a desired correction of the advance of said wire guide is introduced.

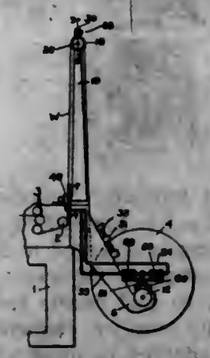
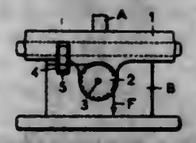
2,771,251
**MACHINE FOR MEASURING CLOTH**
Morris Silverstein, Brooklyn, N. Y.
Application April 13, 1954, Serial No. 422,794
4 Claims. (Cl. 242—68)



1. A chuck supporting device comprising a frame, a pair of spaced parallel bars fixed to said frame, a support plate; means attached to said plate for mounting said plate on said bars so that said plate is movable in the direction of length of said bars and is otherwise substantially immovable relative thereto, means mounted on said plate for supporting a chuck, and means for releasably locking said plate to a selected bar in a selected position of said plate relative to said bars, said locking means comprising a collar fixed to one face of said plate and extending approximately transversely thereto, the free end of said collar being open, said collar having a peripheral opening through which a portion of said selected bar extends, said selected bar being slidable within said opening and having a portion which protrudes into the interior space of said collar, clamp members respectively frictionally, axially, slidably located within the interior space of said collar on opposite sides of said protruding portion of said selected bar, and a locking element located in said collar and protruding out of the open end thereof, said locking element being coupled to said clamping members in such a way that turning of said locking member in one direction about its axis clamps said protruding portion of said selected bar frictionally between said clamping members so as to prevent movement of said plate relative to said bars, and whereby turning of said locking element in the opposite direction about its axis releases said clamping members from said protruding bar portion.

4. A chuck comprising a plate, a transverse collar mounted on one face of said plate for attachment to a chuck-supporting shaft, a pair of bars pivotally connected to each other at respective ends thereof, means mounting said bars on said plate so that they diverge from their connected ends, so that said connected ends are limited to movement along said plate on a radial line, and so that the other ends of said bars are limited to movement relative to said plate along a diametrical line, said radial line being perpendicular to said diametrical line, and sockets respectively mounted on said other ends of said bars, said sockets respectively having outer faces which are parallel to said plate, said socket faces respectively having transverse peripheral flanges, the opposed faces of said flanges being respectively cut away.

---

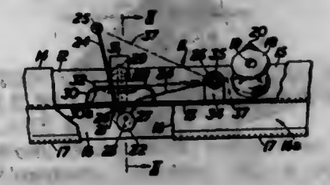


2,771,252
**WEB CONTROL MECHANISM FOR PAPER-CONVERTING MACHINE**
Albert H. Johnson, Worcester, Mass., assignor to United States Envelope Company, Springfield, Mass., a corporation of Maine
Application March 12, 1954, Serial No. 415,723
5 Claims. (Cl. 242—76)

4. A web control mechanism for a web-converting machine of the type adapted to operate on a continuous web of material comprising a supply roll of said material in the form of a wound web of substantially constant width, said supply roll being mounted for free rotation about a horizontal axis, means for laterally shifting said supply roll along said axis, a rotatably driven feed roll for feeding said material from said supply roll to said machine, a pair of pneumatic sensing devices spaced apart from one another at a distance approximately equal to the width of said web, said sensing devices being adapted to engage the surface of said web near the edges thereof and at a position between said supply roll and said feed roll, a port in each sensing device communicating with the surface of said web, a pair of bellows mounted and joined in end-to-end relationship, a pivotable lever attached at its free end to the juncture of said bellows, means responsive to the pivotal movement of said lever in one direction only for moving said shifting means in a given direction along said fixed axis, means responsive to the pivotal movement of said lever in the other direction only for moving said shifting means in the opposite direction along said fixed axis, and means for connecting said bellows through said sensing devices in parallel circuits to a source of suction.

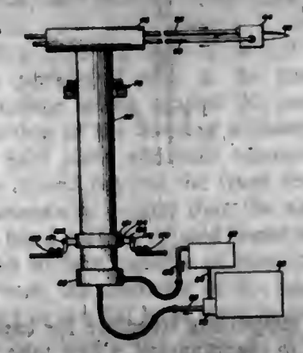
---

2,771,253
**LINE-WINDING MECHANISM FOR FISHING REELS WITH FIXED DRUMS**
Paul Mauborgne, Bernouville (Eure), France
Application December 18, 1952, Serial No. 326,658
Claims priority, application France December 21, 1951
2 Claims. (Cl. 242—84.1)



1. In a fishing reel including a reel rotor and a drum adapted to hold a fishing line and mounted for free delivery of the line therefrom substantially axially of the drum, the provision on the reel rotor of a member curved to deflect the line from a direction substantially parallel to the axis of the drum to continue in a plane substantially perpendicular to said axis, that is, in a direction substantially at right angles to the first named direction, the curve of said member having a radius of curvature substantially greater than that of a conventional size roller, and of another member curved to deflect the line in said plane to continue in a direction substantially tangential to the drum and making with the second named direction an acute angle, the curve of the second named deflecting member having a radius of curvature substantially smaller than that of the first named deflecting member.

---



2,771,254
**YARN CONTROL DEVICE**
Harold Stanier, Radyr, Cardiff, Wales
Application June 25, 1954, Serial No. 439,306
Claims priority, application Great Britain June 27, 1953
10 Claims. (Cl. 242—150)

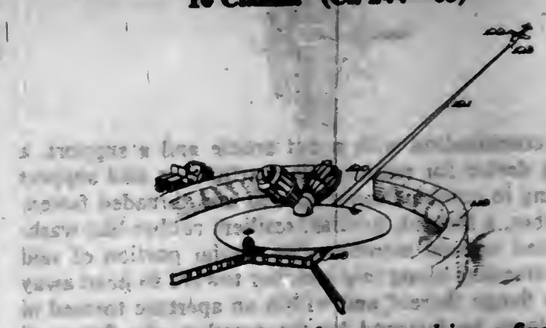
1. A yarn control device comprising in combination a yarn guide, a lever carrying towards one of its ends said yarn guide, a pivot for said lever arranged towards its opposite end, a first disc-like member superimposed upon a second disc-like member to form a further yarn guide with the yarn passing between the adjacent surfaces of the disc-like members, a weight, offset from and movable about said pivot, which loads said lever and is raised about the pivot as the lever turns about the latter against the loading under the varying instantaneous tension of the yarn passing through said yarn guide from a position in which the latter determines a longer path for the yarn through the device to a position in which it determines a shorter path and is lowered on reverse movement of the lever, and means, operatively associated with said lever, for raising said first disc-like member as the weight is raised to separate the disc-like members and relieve the tension applied to the yarn by these latter.

---

2,771,255
**MOUNTING AND DRIVE FOR HELICOPTER ROTOR**
Raymond A. Young, Woodland Hills, Calif.
Application February 28, 1952, Serial No. 274,037
2 Claims. (Cl. 244—17.27)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a helicopter having a fuselage and rotor blades, an improved drive mechanism comprising a single axially-rotatable hollow column supporting said blades; a plurality of thrust producing means each including a fluid motor and a propeller carried by said column and laterally spaced from the axis of rotation of said column; a fluid power supply circuit connected to said means through said column and including flexible conduits; and a mounting collar surrounding said column, said collar being pivotally connected to the fuselage by a spindle such that the column can be pivoted through substantially 90° either transversely of or longitudinally of the fuselage flexing the conduits accordingly, thereby decreasing the overall height of the helicopter.

---

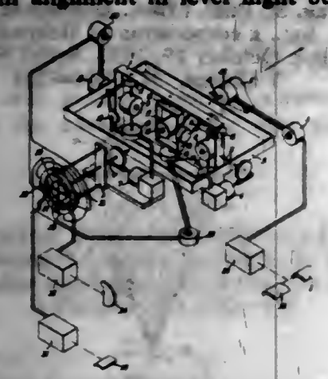


2,771,256
**BALLOON WITH LOAD SUPPORTING TAPES**
James J. Ryan, St. Paul, Minn., assignor to General Mills, Inc., a corporation of Delaware
Application October 29, 1953, Serial No. 389,104
7 Claims. (Cl. 244—31)

1. A load carrying balloon comprising a balloon envelope formed of a plurality of elongated gores attached to each other to form vertical seams, load supporting tapes attached to the central portion of the outer surface of the gores between the seams and extending from the top of the balloon to the lower end, and means for supporting a load from the balloon being attached to said tapes.

---

2,771,257
**JET POWER SYSTEM**
Donald B. Doolittle, Wilmington, Del., assignor, by mesne assignments, to All American Engineering Company, Wilmington, Del., a corporation of Delaware
Application December 29, 1951, Serial No. 264,170
16 Claims. (Cl. 244—63)



1. A jet engine power plant comprising a fixed hollow dome formed with at least one opening, a turned over flange around the perimeter of the opening, a jet engine having a hollow flanged exhaust, said engine exhaust flange being equal in area to said first mentioned flange and being secured to the same, a rotor having a hollow hub rotatably mounted to revolve around said hollow dome, said hub being adapted to receive the exhaust from said jet engine through said dome, and a plurality of rotor supported tailpipes having their terminal exhaust ends so shaped and so proportioned as to form exhaust nozzles, open tangentially of the rotor's circumference adapted to pick up the jet engine exhaust from the said hub and impart tangential thrust to the rotor.

---

2,771,258
**AIRCRAFT STABILIZING APPARATUS**
Frithiof V. Johnson, Scotia, N. Y., assignor to General Electric Company, a corporation of New York
Application January 31, 1950, Serial No. 141,493
9 Claims. (Cl. 244—77)

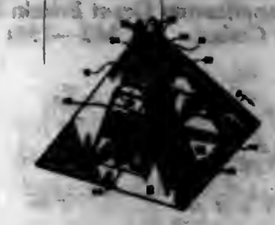
4. In an automatic pilot for an aircraft having a rudder and elevator for controlling angular movement of said

aircraft about mutually perpendicular yaw and pitch axes fixed relative to said aircraft, means defining an absolute yaw axis in space, means associated with said defining means to generate a control signal proportional to displacement of the aircraft about said space yaw axis, said yaw axis in space and said yaw axis fixed relative to said aircraft being in alignment in level flight but becoming

angularly displaced when said aircraft is banked, actuating means for positioning said rudder, actuating means for positioning said elevator, and coupling means associated with said defining means and connected to supply said control signal to energize said actuators in accordance with the cosine and sine functions of the angle of bank of said aircraft.

---

**2,771,259**
**WALL MIRROR MOUNTING**
**Carl A. Laystrom, Decatur, Ill., assignor to Faries Manufacturing Company, Decatur, Ill., a corporation of Illinois**
Application April 10, 1952, Serial No. 281,568
2 Claims. (Cl. 248—28)



1. In combination with a flat article and a support, a fastening device for retaining said article on said support comprising in combination a headed and threaded fastening member, a flanged, tubular, resilient rubber-like washer mounted on said member, the tubular portion of said washer extending along said member toward its head away from the flange thereof and within an aperture formed in the article to be fastened by the member, the flange of said washer extending radially outwardly from said fastening member between the article to be fastened and the support whereby upon tightening of the member into said support the article to be fastened will be forced by the head of the member against said washer thereby distributing the stresses impressed by the head of the member upon the article evenly over the flange of the washer, and a second cupped washer of semi-rigid plastic material positioned between the head of said member and the article to be fastened, said cupped washer acting to yieldingly distribute loads from said head to said article whereby said washers resiliently maintain said article isolated relative to said member and said supports and whereby substantial tightening loads may be applied by the head of said member without injury to said article.

---

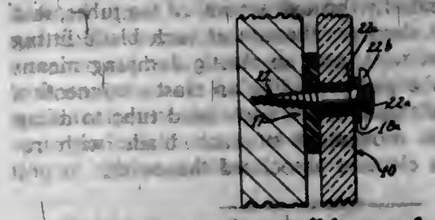
**2,771,260**
**CHRISTMAS TREE STAND**
**Carl W. Thom, Seattle, Wash.**
Application March 20, 1951, Serial No. 216,507
1 Claim. (Cl. 248—44)

A stand for a Christmas tree, comprising: an integral body formed of a single, unitary piece of cardboard having at least three walls each having a generally triangular shape with a horizontally disposed base edge and two side edges of equal length, said walls being hingedly connected together serially side by side by score lines at adjacent side edges and the side edges at the ends of the series having joinder means forming a hinged connection therebetween, said body having an opening at its apex adapted to pass the trunk of such Christmas tree with the edges of the opening pressing there against, at least three of said sidewalls being each cut on a generally inverted U-shaped line with the lower ends of said U-shaped line being joined together by a score line close to and parallel to the base edge of the wall forming a hinge line and the

material cut out by said U-shaped line being bent inwardly forming brace arms with the innermost end portion lying adjacent the axis of the body and having tree-abutting means formed therein which includes a crotch-like edge facing and close to said body axis adapted to grip such tree trunk; said apex opening in said body being formed by having a horizontal upper score line in each of said walls spaced a short distance from the junction of its side edges, the side edges of adjacent walls being divided from body apex to the level of said upper score line whereby the wall material thereabove forms hinged tabs displaceable to pass such tree trunk and biased thereagainst in various directions.

---

**2,771,261**
**TELESCOPING TRIPOD LEG**
**Carl Niggeloh, Radevormwald, Germany, assignor to Kürbi & Niggeloh, Radevormwald, Germany, a firm**
Application May 8, 1951, Serial No. 225,115
Claims priority, application Germany May 11, 1950
6 Claims. (Cl. 248—191)



1. A leg of a supporting structure for cameras and the like, comprising in combination, a first tube of non-circular cross section having a plurality of spaced elongated channels located along its inner surface and extending outwardly from its outer surface, one of said channels having a stop means located therein, and said first tube having a projection located on its outer surface; a second tube telescopically mounted about said first tube for sliding movement thereon and having a cross-section mating with that of said first tube, said second tube having a number of spaced elongated channels located along its inner surface which is equal to one more than the number of elongated channels located in said first tube, one of said channels of said second tube having a stop means located therein and said one channel of said second tube being located over said projection of said first tube so that said projection cooperates with said stop means in said one channel of said second tube to limit the movement of said second tube with respect to said first tube; and a third tube telescopically mounted within said first tube for sliding movement therein and having a number of elongated channels located along its inner surface which is equal to one less than the number of elongated channels in said first tube, said third tube having a projection located on its outer surface and mounted in said one channel of said first tube so as to cooperate with said stop means in said one channel of said first tube to limit the movement of said third tube with respect to said first tube.

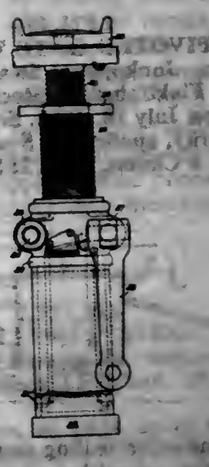
**2,771,262**
**COMBINATION OF THREADED BOLT AND DEFORMABLE BUSHING FOR SUPPORTING FRANGIBLE PLATE ON A WALL**
**Carl A. Laystrom, Decatur, Ill., assignor to Faries Manufacturing Company, Decatur, Ill., a corporation of Illinois**
Application December 15, 1954, Serial No. 475,386
2 Claims. (Cl. 248—216)

1. In combination in a wall hanger for a frangible plate or the like having an aperture therethrough, a threaded supporting member having a shank of lesser diameter than the diameter of said aperture and a head of larger diameter than the diameter of said aperture, said member having a tapered portion between said shank and said head whereby the member becomes progressively larger in diameter as it approaches said head, a flanged tubular bushing in said aperture and having the flange thereof substantially larger in diameter than the diameter of said aperture and positioned between the back of said plate and said wall, a tubular portion on said bushing, said tubular portion having a diameter substantially the same as the diameter of said aperture and extending from said flange around said member and through said aperture beyond the front face of said plate, said bushing comprising a resilient rubber-like material, said head having a substantially flat surface extending from the outer-most end of said tapered portion to the peripheral edge of the head providing a compression surface acting against the projecting end of the tubular portion of the bushing without contacting the front face of said plate and said tubular portion being constructed to extend beyond the front face of said plate a distance substantially greater than the axial distance between the flat head surface of said member and the point on said tapered surface capable of maximum penetration into said aperture, the diameter of the tapered portion in a plane parallel to the flat head surface and spaced therefrom a distance substantially equal to the wall thickness of the tubular portion of the bushing being substantially less than the diameter of the aperture in said plate.

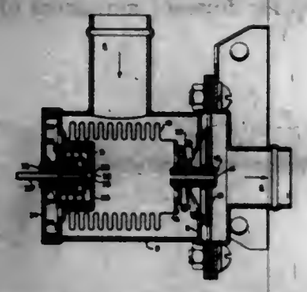
---

**2,771,263**
**MOVABLE BRACKET FOR CAN OPENERS AND THE LIKE**
**Lawrence M. Bebo, Chicago, Ill.**
Application May 2, 1952, Serial No. 285,660
1 Claim. (Cl. 248—300)



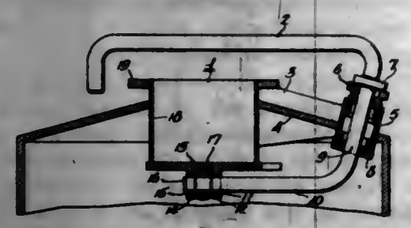
A support for kitchen and other articles adapted to be secured beneath kitchen cabinets and the like including an elongated track secured to the under portion of the cabinet transversely thereof and having its outer end facing the front of the cabinet, said track being closed at one end only, a bracket slidable in a horizontal plane in said track, the under surface of said track having a slot formed therein adjacent said outer end, a spring finger carried by the bracket and adapted to move into said slot to stop the forward movement of said bracket,

said finger including means to retract the same and free the bracket for movement and removal from said track, and a socket disposed in a vertical plane secured to and depending from the outer end of said bracket for receiving the mated end of a kitchen or other article, whereby the bracket and the article may be slid in a horizontal plane to an inoperative position beneath the cabinet and to an operative extended position forward of the cabinet with the vertically disposed socket exposed to view.



---

**2,771,264**
**PIT PROP**
**John Handley, Little Mariand, Brier Hill, Purley, England, assignor of one-half to Jack Nixon Browne, London, England**
Application March 31, 1953, Serial No. 345,937
Claims priority, application Great Britain April 2, 1952
2 Claims. (Cl. 248—356)

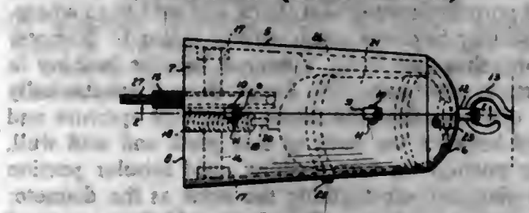


1. A telscopic pit prop including a hollow column presenting a base, a segmental contractile nut member carried by said column, a hollow screw-threaded spindle extending within said column and provided externally with screw threads of one hand and internally with screw threads of opposite hand and of different pitch, the external screw threads of the spindle engaging said contractile nut member, adjustable clamping means mounted on said nut member for clamping the nut member with adjustable pressure about the screw-threaded spindle whereby to permit the screw-threaded spindle to yield when the prop is subjected to overload, a second screw-threaded spindle projecting above and engaging with the internal schew thread of the first screw-threaded spindle, and a ceiling-engaging head mounted on the upper end of said second screw-threaded spindle.

2,771,265
PILOT OPERATED VALVE
John E. Woods, Cohasset, Mass., assignor to Standard-Thomson Corporation, Boston, Mass., a corporation of Delaware
Application February 12, 1952, Serial No. 271,216
2 Claims. (Cl. 251—28)

1. A valve assembly having, in combination, a casing, a main valve seat defining an inlet space and an outlet space in the casing, a support member dividing the inlet space into sections, said member having peripheral openings and forming a central pilot valve seat, a main valve, an expansible chamber in one of said inlet sections having a head secured to the main valve and the end opposite its head sealed to said support member intermediate said openings and the pilot valve seat, said chamber communicating exteriorly directly with said inlet space, a pilot valve situated adjacent said support member seat on the side thereof opposite to said chamber, a control bellows supported by the casing and operatively associated with the pilot valve, and means to connect the bellows to a pressure source externally of the casing, said pilot valve having provision to become open upon a contraction of the bellows to admit liquid through said pilot valve to the interior of the chamber, said chamber having a leakage opening to said outlet space through the main valve.

2,771,266
PIVOTED GATE VALVE
Gustaf Larsson, Jonkoping, Sweden, assignor to AB Svenska Flaktfabriken, Stockholm, Sweden
Application July 10, 1952, Serial No. 298,152
Claims priority, application Sweden July 12, 1951
4 Claims. (Cl. 251—87)

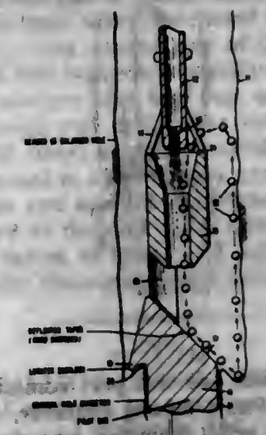


1. For a planar valve seating surface defining an opening, a closure valve comprising a plane disk having spaced apertured lugs depending from the center thereof, a rod having one resilient portion disposed substantially parallel to the plane of the seating surface and loosely mounted in the apertures of said lugs, a ring fixed to the rod portion intermediate the lugs to prevent displacement of the disk axially from the rod, said rod having another portion remote from the disk disposed at a given obtuse angle to said one resilient rod portion, and bearing means mounting said other portion of the rod against substantial axial displacement and for pivotal movement about an axis coplanar with the perpendicular center line of said opening and disposed at said given obtuse angle to the plane of said seating surface to effect sliding movement of said disk across said seating surface, said one resilient rod portion being operable to move in an arcuate path having a high point underlying said seating surface, the resilience in said one rod portion thereby providing an upward bias on said disk to sealingly engage the same against said seating surface.

2,771,267
LACING FOR COMPRESSOR BLADES
Leon J. Weymouth, Jr., Manchester, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application May 27, 1952, Serial No. 290,116
10 Claims. (Cl. 253—77)

5. A rotor having a hub and a plurality of blades extending radially outward from the hub, each of said blades having a tube extending circumferentially therethrough and secured against movement therein, a lacing wire extending circumferentially through several of the tubes, said wire having piston elements thereon at each blade fitting within the adjacent tube, and an elastic damping means secured in each tube and providing an elastic connection from each piston element to the associated tube to damp the circumferential movement of each blade with respect to the piston element associated therewith.

2,771,268
HOUSED MOTORIZED PULLEY
Roger D. Roswall, Paterson, N. J.
Application July 12, 1954, Serial No. 442,573
2 Claims. (Cl. 254—175.3)

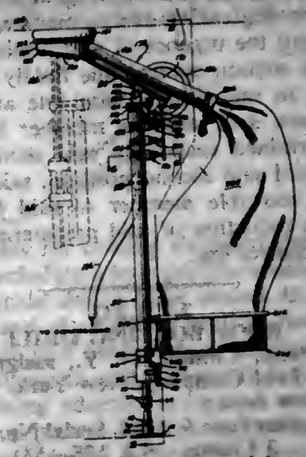


1. In a clothes line pulley assembly, an elongated housing having open and closed ends, and formed with longitudinally extending connected sections, a shaft transversing said housing and rotatably journaled in said sections in proximity to said open end, a pulley fixed to said shaft for receiving a clothes line extending out of said housing through said open end, a gear fixed to said shaft adjacent said pulley, a motor secured within said housing adjacent one of said sections and said closed end and having a drive shaft disposed in tangential relation with said gear and inclined relative to the longitudinality of said housing, said drive shaft provided with a worm meshing with said gear for operating said pulley by said motor, and a weight disposed within said housing adjacent said other section for counterbalancing said motor.

2,771,269
ENLARGING BORE HOLES BY PELLET DRILLING
John E. Eckel and Frank G. Boucher, Tulsa, Okla., assignors to Esso Research and Engineering Company, a corporation of Delaware
Application June 30, 1953, Serial No. 365,096
3 Claims. (Cl. 255—1.5)

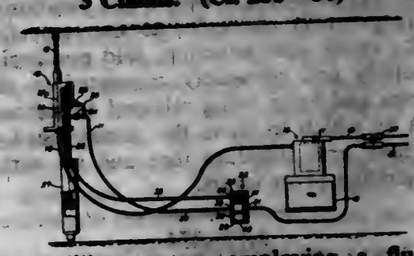
1. A drilling apparatus for enlarging the diameter of a bore hole in the earth comprising a tubular support member terminating at its lower end in a jet nozzle

adapted to provide a downwardly directed high velocity jet of fluid, a second tubular member positioned below said jet nozzle and supported by said first tubular member with the inner bore of said second tubular member substantially aligned with said jet nozzle, a plug element supported below said second tubular member in a manner providing access to the inner bore of said tubular member



from the bore hole annulus, said plug member having an inclined upper surface whereby to deflect laterally fluids and solids impinging thereon from said second tubular member, said plug element having a diameter substantially that of the bore hole to be enlarged, and a lateral projection adjacent the upper end of said plug element whereby to position the same at the bottom of the enlarged portion of the bore hole.

2,771,270
EARTH BORING APPARATUS
John P. Selberg, Los Angeles, and Gardner D. Currie, Altadena, Calif., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application June 10, 1953, Serial No. 360,706
12 Claims. (Cl. 255—28)



1. Acoustic mud fluid decoupling means for acoustically isolating mud fluid in the bottom portion of a well hole from a longitudinally vibrating drill rod and bit disposed in the well hole, wherein the bit is disposed in engagement with the bottom of the well hole and the drill rod and bit are adapted to vibrate at substantially the resonant vibration frequency of the drill rod and bit and the bit tends to generate energy consuming sound waves in said mud fluid, and comprising means formed on said drill rod defining annular resilient compressible chamber means disposed around said rod and located on said rod substantially less than one-quarter wave length distance in the mud fluid from said bit, said chamber means being cyclically compressible at the vibration frequency of said rod and bit in response to pressure surges in the mud fluid generated by the vibrating rod and bit and thereby being effective to absorb cyclic displacement of the mud fluid.

2,771,271
DUST COLLECTOR FOR DRILLS
Edgar Lawson, Sr., Wilcoe, W. Va.
Application September 24, 1954, Serial No. 458,101
13 Claims. (Cl. 255—50)

1. A dust collector for drills comprising a post extending upwardly from a supporting surface, a piston carried by said post and extending longitudinally upwardly therefrom, a cylinder having a closed end defining the cylinder head mounted on said piston and telescopically enclosing the piston with the head of the piston spaced from said cylinder head, said cylinder slidably mounted on said piston for movement longitudinally thereof, a first fluid seal carried by the cylinder head and a second fluid seal carried by said piston head to define a fluid receiving chamber therebetween, a floating piston carrying a fluid seal thereon at one end thereof and disposed in said chamber, spacing means for maintaining the seal on said floating cylinder in spaced relation with said first fluid seal to define an expansible fluid receiving compartment, dust collecting means mounted on said closed cylinder end for movement in an arcuate path for engagement with a surface to be drilled, and means for supplying fluid under pressure to said expansible compartment for causing expansion thereof by impingement of the fluid under pressure upon said cylinder head to move said cylinder longitudinally of said first-mentioned piston to firmly seat said dust collecting means against said surface to be drilled and for supplying fluid pressure to said dust collecting means to remove dust therefrom caused by a drilling operation.

2,771,272
DRILLING SYSTEM
Frederick B. Miller, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application October 26, 1954, Serial No. 464,801
3 Claims. (Cl. 255—50)

2. In a drilling system employing a fluid-pressure actuated rock drill, a flexible pressure conduit adapted to supply actuating fluid to said rock drill, dust receptor means carried by said rock drill for receiving cuttings and dust from a hole being drilled, a suction source, a flexible dust suction line connecting said receptor means and said suction source and having filter means therein, a valve means in said pressure conduit, said valve means includ-

ing a movable member movable between a first position wherein said movable member prevents flow through said pressure conduit and a second position wherein said movable member permits flow therethrough, biasing means urging said movable member toward said first position, means for moving said movable member to said second position against the urgence of said biasing means including a flexible suction control line fluidly connecting said valve means to said dust suction line adjacent the dust receptor means, said movable member being responsive to a predetermined suction in said suction control line to move toward said second position, said biasing means moving said movable member to said first position in response to a reduction of said predetermined suction in said suction control line.

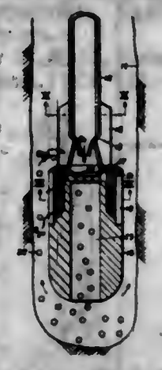
2,771,273

## ROOF BOLTING DRILL

Benham S. Pond, Clinton, N. Y., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey

Application June 6, 1952, Serial No. 292,064
3 Claims. (Cl. 255—51)

1. In a combined mine roof bolt drilling and setting tool of the character described, a carriage frame having side portions, upwardly extending supporting levers pivotally connected to each of the side portions, a crank arm structure pivotally connected to the upper ends of the upwardly extending supporting levers having rearwardly extending lifting arms, a feed assembly connected between the frame and the crank arm structure to raise and lower the same on the upwardly extending supporting levers, a spindle head unit pivotally carried by the rearward ends of the crank lifting arms and movable with the crank arm structure up and down between the frame side portions, parallel links extending between the spindle head assembly and the supporting levers, means operatively associating the parallel links with the feed assembly for constantly pivoting the spindle head to a vertical position on the lifting arms of the crank structure as the latter is raised and lowered, and positioning levers respectively pivotally connected to the respective lifting arms of the crank arm structure, said positioning levers being pivotally and releasably connected to the frame side portions and upon being released therefrom serving as handles by which to move the spindle head assembly and the crank arm structure fore and aft with the upwardly extending pivot levers.



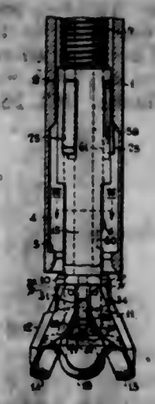
2,771,274

## RECYCLE FLUID CONTROL IN PELLET IMPACT DRILLING

Alexander B. Hildebrandt, Tulsa, Okla., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application October 28, 1953, Serial No. 388,756
5 Claims. (Cl. 255—61)

1. A drill bit assembly for drilling bore holes in the earth by entraining pellets in a high velocity stream of fluid, which comprises a jet nozzle adapted to eject a stream of fluid, an open-ended mixing chamber below the jet nozzle and a baffle member surrounding the upper end of said mixing chamber, said baffle member having a top central opening, substantially aligned with said jet nozzle and with the top opening of said mixing chamber, of sufficient size to permit the passage of pellets there-



through, and at least one side port communicating with the top opening of said mixing chamber, said side port being smaller than pellet diameter, whereby a portion of the fluid in an up-flowing stream of pellets and fluid will enter said mixing chamber through said port while pellets will be directed above the top of said baffle to enter said mixing chamber through said top opening.

2,771,275

## HARD FORMATION RETRACTABLE DRILL BIT

John E. Ortloff, Tulsa, Okla., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application January 29, 1952, Serial No. 268,894
6 Claims. (Cl. 255—61)

1. A retractable drill bit assembly comprising in combination a vertically disposed drill collar; an elongated vertically disposed tubular element; a sleeve element surrounding and in vertical movable relation with a lower portion of said tubular element; resilient means coacting with said tubular element and said sleeve element to yieldably restrain downward movement of said tubular element relative to said sleeve element; a tubular member surrounding and in vertical movable relation with an upper portion of said tubular element; interengaging means between said tubular member and said tubular element to limit movement of said tubular member upward relative to said tubular element; means interconnecting said tubular member and said tubular element to thrust said tubular element vertically downward relative to said sleeve element; means attachable to said tubular member adapted to lower said tubular member, said tubular element and said sleeve element within said drill collar; releasable latching means disposed in a cooperative arrangement between the drill collar and the sleeve element to limit downward movement of said sleeve element relative to said drill collar; a pair of oppositely disposed downwardly depending supports fixed to said sleeve element; a first pair of cutter elements; one of said cutter elements being mounted on the lower end of each said depending support; a second pair of oppositely disposed cutter elements depending from and pivotally mounted on the lower end of said tubular element; a wedge element supported by and between said depending supports and arranged to expand said second pair of cutter elements with respect to said tubular element upon downward movement of the tubular element, said second pair of cutter elements in expanded condition being substantially at right angles to and laterally between said first pair of cutter elements; means for moving said drill collar vertically downward relative to said sleeve element; second releasable latching means disposed in a cooperative arrangement between said drill collar and said tubular element to limit downward movement of the drill collar relative to the tubular element; and means to rotate said drill collar in unison with said tubular element and said sleeve element.

2,771,276

## METALLIC RAILING STRUCTURE

Harry S. Constance, Jr., and August C. Wurtzer, Catonsville, Md.

Application February 8, 1954, Serial No. 408,792
5 Claims. (Cl. 256—22)

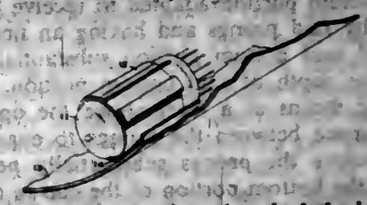
1. In a railing structure, a rail having a longitudinally disposed channel in one of its surfaces, the inner side walls of said channel having opposed parallel longitudinally disposed grooves, a picket disposed in angular relationship with said rail with its end engaged in said channel, said picket having a transversely disposed groove in one face thereof and disposed in the same plane with and at right angles to said wall grooves, a key plate having its side edges slidable in said grooves and engageable at one end in said transverse picket groove, and means for locking said plate against movement.

2,771,277

## FIN DAMPER INSERT

Stanley W. Cross, South Coventry, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Application April 6, 1955, Serial No. 499,558
6 Claims. (Cl. 257—261)



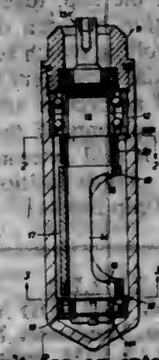
1. The combination with an engine cylinder having a plurality of cooling fins on the outer surface, of a vibration damper for two adjacent fins consisting of a slug of vibration damping material positioned substantially radially of the cylinder between adjacent fins, said slug having a wire mesh around it.

2,771,278

## COOLING APPARATUS

Robert E. Slack, Endicott, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application February 23, 1954, Serial No. 411,657
3 Claims. (Cl. 257—263)



3. In apparatus for cooling electrical devices, a wrap-around shield including a loop portion which is adapted to receive an electrical device to be cooled, U-shaped flange means on one end of said loop portion, flange means on the other end of said loop portion adapted to fit within said U-shaped flange in complementary fashion, both said flange means being adapted to be bent over against the part of said loop portion adjacent said other end of said loop portion, said device to be cooled having a pressure applied thereto by said shield as the flange means are bent over against said loop portion, clip means mounted on a cold plate and including an open loop portion adapted to receive a major portion of said shield in intimate contact therewith, and extension means on at least one end of said open loop in substantial parallelism with said cold plate so that a tapered tool may be inserted between said extension means and said cold plate to open the loop from its normal size to facilitate insertion or removal of said tube shield therein.

2,771,279

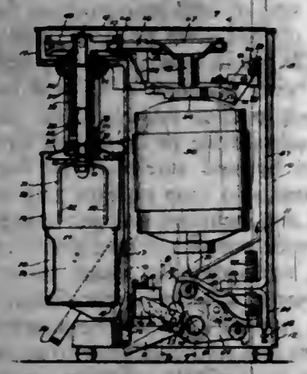
## CONCRETE VIBRATORS

Brian Barton Dearden, Bramhall, England, assignor to C. H. Johnson (Machinery) Limited, Stockport, England, a British company

Application April 8, 1955, Serial No. 500,177
10 Claims. (Cl. 259—1)

1. A vibrating unit for an internal concrete vibrator comprising a casing in which two out-of-balance elements are mounted co-axially and annularly arranged so that they rotate concentrically one within the other, means for imparting rotary motion to the inner element, and a torsional spring interconnecting said elements and providing a resilient driving connection between said elements automatically to allow them to adjust themselves angularly relative to each other to vary the amplitude of vibration generated, the outer out-of-balance element being journalled on the inner out-of-balance element.

2,771,280

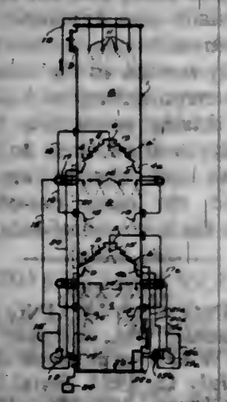


## TRITURATING AND MIXING MACHINE

Mathew Andis, Racine, Wis., assignor to Andis Clipper Co., Racine, Wis., a corporation of Wisconsin

Application July 15, 1954, Serial No. 443,569
19 Claims. (Cl. 259—108)

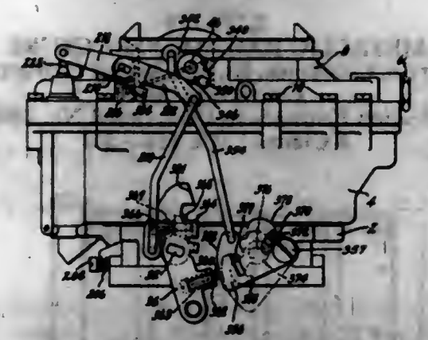
1. In a mixing device using a pronged mixing head for triturating material in a cup, the combination of a



cup support and mixing head and means mounting said support and head for relative axial movement, the mixing head comprising prongs having free portions at least substantially equal in length to the full depth of immersion in the contents of the cup, the space between said prong portions being open and unobstructed and the cup having a bottom portion adapted to receive contents for trituration by said prongs and having an upward extension beyond said bottom portion substantially equal in extent to the depth of said bottom portion, the mixing head having means at a level above the open and unobstructed space between the prongs to engage the cup extension before the prongs substantially penetrate the contents of the bottom portion of the cup in the event of relative lateral displacement between the mixing head and cup, said cup support having support means spaced from the cup engaging means on the mixing head a distance

greater than the height of the cup, the mixing head being bodily receivable into the cup to engage said prong portions substantially full depth in the contents of the cup in the event the cup and mixing head are properly aligned, and means for effecting relative movement between the cup support and mixing head in an axial direction for a distance sufficient to cause the free end portions of the prongs to traverse the whole length of the extension and to penetrate to substantially full depth the contents in the bottom portion of the cup, together with means for effecting relative rotation between the mixing head and cup and having a controlling switch actuated by the means for effecting relative axial movement between the cup support and mixing head as prongs approach substantially full immersion in the contents of the cup, whereby said switch will be inactive if said extension engages the mixing head in a displaced relative position of the cup to block axial movement of said cup support.

---



**2,771,281**
**BENZOL SCRUBBING METHOD AND APPARATUS**
**Carl Otto, Manhasset, N. Y.**
**Application April 12, 1954, Serial No. 422,478**
**12 Claims. (Cl. 261—22)**

1. Apparatus for separating vapor from a stream of coke oven gas, comprising a scrubbing tower enclosing superposed scrubbing sections, means for passing a stream of coke oven gas upward through said tower, and means for spraying a vapor absorbing scrubbing liquid into an upper section of said tower and for withdrawing downwardly moving scrubbing liquid from separate collector chambers adjacent the lower ends of two adjacent tower sections, and means for pumping from each of said chambers liquid separately collected in said two separate collector chambers and returning the liquid so pumped in spray form partly into said lower section and partly into another tower section in end-to-end relation with said lower section.

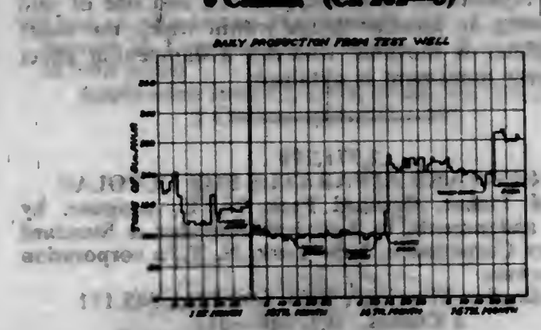
---

**2,771,282**
**CARBURETOR**
**Elmer Olson and Lawrence C. Dermond, Rochester, N. Y., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware**
**Application December 29, 1951, Serial No. 264,136**
**26 Claims. (Cl. 261—23)**

1. A charge forming device for internal combustion engines having in combination primary and secondary mixture passages both of which are adapted to supply combustible mixture to the intake manifold of said engine, means for supplying fuel and air to each of said mixture passages, primary and secondary throttle valves controlling the quantity of combustible mixture supplied by said primary and secondary carburetors respectively, mechanism for operating said primary and secondary throttles concurrently, and means for supplying fuel for idling to the primary mixture passage only, said last named means comprising fuel supply passages for introducing fuel into the primary mixture passage for idling, said fuel supply passages being located on opposite sides of the primary mixture passage, a single fuel inlet connecting one of said fuel supply passages with the mixture passage, a plurality of fuel inlets connecting the other of said fuel passages with the mixture passage, all of said fuel inlets being closely adjacent the primary throttle valve when said valve is in closed position and a plurality of idling fuel wells, each of which supplies fuel to one of the idling fuel supply passages.

---

**2,771,283**
**AIR CONDITIONING UNIT**
**John Ermocsina, Woodside, Calif.**
**Application May 5, 1955, Serial No. 506,200**
**2 Claims. (Cl. 261—30)**

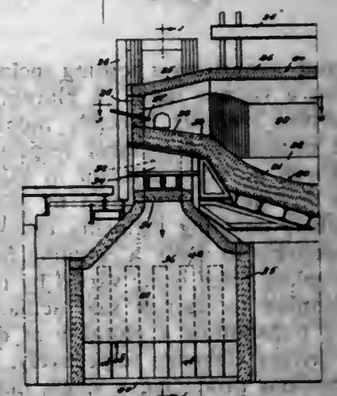


1. A device of the character described comprising a generally rectangular casing having top and bottom horizontal walls spaced from each other, side and end walls extending vertically between said top and bottom walls,

an air inlet opening in said top wall and an air outlet opening in one of said end walls, the bottom edge of said outlet opening being spaced above the said bottom wall, means for maintaining a predetermined quantity of water in the bottom of said casing, a generally rectangular filter element within said casing extending between said top and bottom walls and surrounding said inlet opening and spaced inwardly of said side and end walls, spider legs attached at one of their ends to said top wall of said casing at points spaced circumferentially about said air inlet opening, the opposite ends of said spider legs converging upwardly and inwardly from said casing, a bearing ring affixed to said opposite ends of said legs, a motor mounted in said bearing ring and extending downwardly therefrom but spaced above said air inlet opening, a fan fixed to the lower end of said motor and positioned within said casing coaxially with said air inlet opening, and a foraminous frusto-conical pump fixed to said fan extending downwardly therefrom in order that the open end thereof is disposed below the surface of the water in the bottom of said casing so that when said fan and pump are rotated the said pump will spray water onto the surface of the filter element and said fan will draw air into said casing and force said air through said filter element and out through the said outlet opening, said air being cleaned and conditioned when passing through said filter element.

---

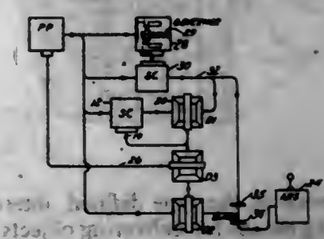
**2,771,284**
**PROCESS FOR REMOVAL OF DEPOSITS FROM SULFUR MINING PIPES USING HOT CAUSTIC SODA SOLUTION**
**John E. Monroe, Jr., Port Sulphur, La., assignor to Freeport Sulphur Company, New York, N. Y., a corporation of Delaware**
**Application April 6, 1953, Serial No. 346,968**
**6 Claims. (Cl. 262—3)**



1. In connection with the mining of sulfur by the Frasch process using a concentric pipe system, a process for removing obstructive deposits accumulated within the sulfur conveying pipe, containing carbon-sulfur complexes and inorganic material which comprises flowing hot caustic soda solution down into said pipe, subjecting the deposit to the action of said hot caustic sode solution until such removal has occurred and during such action heating the pipes on which the deposit occurs by flowing hot water down the surrounding water conveying pipe and flowing the used caustic solution together with the removed deposit from the pipe up to the surface by means of water and of compressed air introduced through an air pipe down into said pipe containing the removed deposit.

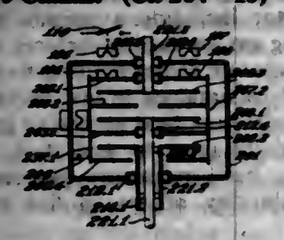
---

**2,771,285**
**REGENERATOR**
**Russell Pearce Heuer, Villanova, Pa., assignor to General Refractories Company, a corporation of Pennsylvania**
**Application January 13, 1955, Serial No. 481,684**
**2 Claims. (Cl. 263—15)**



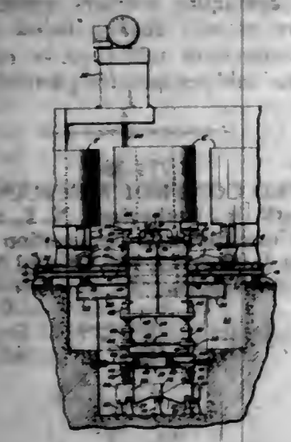
1. In a heat regenerative system for a hearth furnace discharging basic dust in its flue gases, a downtake emptying vertically into a slag pocket and having at least one inlet from the hearth and combustion chamber of said furnace, a side wall portion of said slag pocket having at least one outlet for said flue gases to pass through said downtake, over said slag pocket and through said outlet in a continuous downward and outward discharge sequence and said downtake having a basic refractory heat absorbing wall extending upward from said outlet and a heat regenerator including a portion having refractory head absorbing gas contacting surfaces reactive with said dust at a temperature somewhat below operating temperatures ordinarily maintained in said furnace and a portion having basic refractory heat absorbing gas contacting surfaces substantially inert to said dust, said regenerator portion having basic refractory gas contacting surfaces including a plurality of spaced flue elements forming

vertical flues rising immediately from said outlet, said flues having as their walls nearest the downtake, walls separated throughout most of their length from the said basic refractory wall of the downtake by an air space communicating with the air outside of said regenerative system and furnace, the gases discharging through said downtake, over said slag pocket, through said outlet and into said flues, said flues communicating with the said regenerator portion having reactive refractory gas contacting surfaces, and said regenerator portion having basic refractory gas contacting surfaces appreciably reducing the temperature of said dust to below its effective reaction temperature with said reactive refractory before said dust reaches said regenerator portion having reactive refractory.



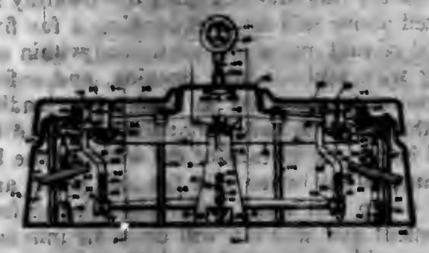
---

**2,771,286**
**SPEED CONTROL MECHANISM**
**William H. Clark, Jr., Rutherford, N. J., assignor to Curtis-Wright Corporation, a corporation of Delaware**
**Application January 19, 1953, Serial No. 331,990**
**7 Claims. (Cl. 264—5)**



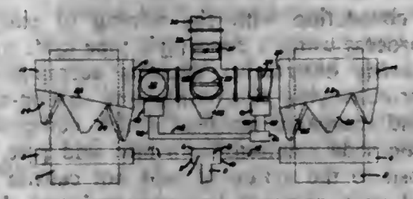
7. In a power plant speed control system, a constant speed source, a speed changer driven by the power plant, comparing means driven by the speed changer and by the constant speed source having an acceleration function output, said output being operatively connected to change the drive ratio of said speed changer, a reference speed source, comparing means driven by said reference speed source and by said power plant at a function of power plant speed and having a speed error output, and summing means connected to and driven by said two outputs, said summing means having an output operatively connected to change power plant speed.

2,771,287
**TIMING ACTUATOR WITH HYDRAULIC LINK**
George A. Winderburn, Putnam, Clarence B. Walworth, Rocky Hill, and Leroy E. Lawrence, Putnam, Conn.; said Walworth and said Lawrence assignors to said Winderburn
Application October 15, 1952, Serial No. 314,822
10 Claims. (Cl. 264—13)



1. An actuator comprising a housing enclosing a chamber for holding a viscous liquid; a plurality of driving elements; a driven member movably mounted in said chamber, said element and member respectively having driving and driven portions adjacent to each other and adapted to be hydraulically coupled by said liquid; an actuated member; coupling elements disposed on said members respectively to apply a coupling force therebetween, said coupling force being varied by movement of said driven member to operate said actuated member; and means for transmitting a plurality of different motions to said driving elements respectively, the summation of said motions producing a single motion of said driven member, thereby to operate said actuated member according to said summation.

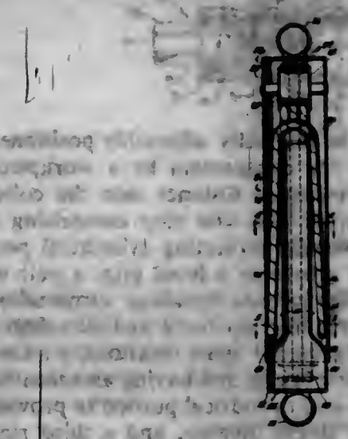
2,771,288
**WEIGHING DEVICE**
Robert G. Staples, Jr., Camden, N. J., and Martin W. Boogher, Sr., Montgomeryville Township, Pa., assignors to Link-Belt Company, a corporation of Illinois
Application November 17, 1953, Serial No. 392,594
10 Claims. (Cl. 265—52)



1. In a device of the type defined, intermittently operated conveying means for delivering objects successively to a location at which the weight of each object is to be determined, a weight responsive device mounted in a fixed position at said location, an object supporting frame mounted on said device for varying the response thereof in accordance with the weight of the object supported by the frame, said frame having spaced portions arranged on opposite sides of said conveying means, object engaging means mounted on each spaced frame portion for lateral movement relative thereto, means mounted on said spaced frame portions for moving said object engaging means laterally into and out of cooperating positions in readiness for engaging the objects delivered successively to said location by the delivering means, and means mounting said spaced frame portions on the remainder of the frame for movement relative to the latter and to said conveying means to cause their object engaging means to lift each object from and return it to the conveying means.

2,771,289
**WEIGHING SCALES**
Harlan A. Hadley, Burlington, Vt., assignor to Metrogram Corporation of America, Winooski, Vt., a corporation of Vermont
Application November 12, 1949, Serial No. 126,809
5 Claims. (Cl. 265—54)

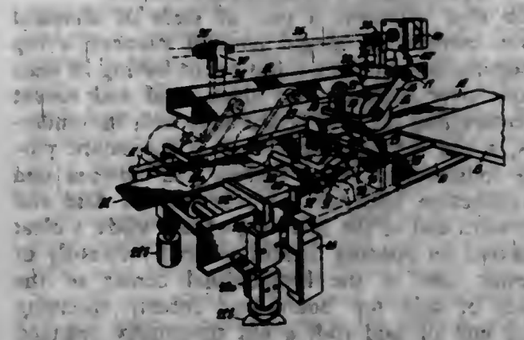
1. In a weighing scale of the class described, the combination with a load-supporting lever system including an equal-arm lever, of an electrical measuring device for indicating the weight of the load on said lever system, and means, including a capacitor at each end of said equal-arm lever, for electrically connecting said lever system to said measuring device, each of said capacitors comprising a stationary plate and a movable plate, said movable plate cooperating with said stationary plate and being fixed to and movable with said equal-arm lever to vary the capacitance of said capacitors, and one of said plates having an annular flange within which the other of said plates is movable whereby a dampening effect on the lever movement is obtained.



2,771,290
**GAS OFF-TAKE APPARATUS FOR CUPOLAS**
Townsend Tinker, Orchard Park, N. Y., assignor, by mesne assignments, to American Radiator & Standard Sanitary Corporation, New York, N. Y., a corporation of Delaware
Application March 27, 1953, Serial No. 345,171
5 Claims. (Cl. 266—31)

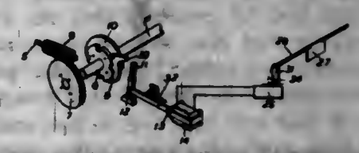
1. The combination with an iron melting cupola, of an annular gas off-take bustle radially spaced from and surrounding said cupola, a plurality of conduits radially interconnecting said cupola and said bustle, said bustle having an outlet, and said bustle tapering in transverse cross-sectional area from a maximum at said outlet to a minimum at a point diametrically opposite to said outlet.

2,771,291
**ELASTIC CORD SHOCK ABSORBER**
Chester H. Webb, Dayton, Ohio, and Theodore B. Holliday, Elmhurst, Ill.
Application April 10, 1951, Serial No. 220,232
7 Claims. (Cl. 267—63)



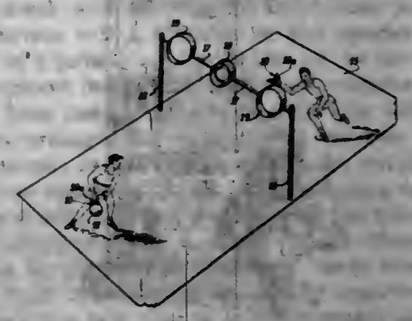
1. A shock absorber comprising a cylinder, a member therein telescopically arranged capable of linear motion for a predetermined distance, a plurality of elastic cords the axes of which are substantially parallel to the longitudinal axes of said telescoping members and interconnecting said cylinder and member, one set of elastic cords interconnecting fixed supports arranged adjacent opposite ends of said cylinder and member in order to exert a

force in one linear direction, another set of elastic cords interconnecting fixed supports on said cylinder and said member and exerting a force substantially parallel to the longitudinal axes of said telescoping members in the opposite linear direction, one of said fixed supports being located at an intermediate point on said cylinder.



2,771,292
**SQUARING DEVICES FOR BOX CLOSING MACHINES**
William J. Emerson, Haddonfield, N. J., assignor to Samuel M. Langston Co., Camden, N. J., a corporation of New Jersey
Application June 17, 1953, Serial No. 362,242
2 Claims. (Cl. 271—50)

1. A straightening apparatus for folded blanks, including a belt conveyor for advancing the blank, a roller for pressing the blank onto the conveyor, a stop movable into and out of the path of the blank, a blank pusher movable into and out of engagement with the rear edge of the blank to force it against the stop, pneumatically actuated means for advancing and retracting said stop and said pusher and for raising and lowering said roller, and blank-actuated means for automatically synchronously operating said pneumatic means to advance the stop so as to successively interrupt the advance of the blanks with the conveyor and to simultaneously raise the roller from blank engaging position, to advance the pusher into engagement with the rear edge of the immobilized blank so as to press the blank forcibly against the stop and to straighten the blank, and to then lower the roller onto the blank so as to maintain the blank by pressure in straightened condition and to retract the stop and pusher to permit the blank to advance with the conveyor under control of said roller.



2,771,293
**RECORD CARD CONTROLLED STATISTICAL MACHINES**
Eric John Guttridge, Barnet, England, assignor to Powers-Samas Accounting Machines Limited, London, England, a British company
Application August 26, 1953, Serial No. 376,710
Claims priority, application Great Britain October 20, 1952
6 Claims. (Cl. 271—88)

1. A record card controlled statistical machine comprising driving means including a normally active clutch, card feeding rollers driven by said driving means, a card receiver to receive cards delivered from the machine by the feeding rollers and including a support movable away from the position of card delivery thereto under the weight of cards delivered thereto and spring-urged towards the position of card delivery, a normally inactive clutch trip member spring-urged to the active position thereof thereby to render said clutch inactive, a solenoid cooperating with the trip member to retain the member in the inactive position thereof, a normally closed electric switch electrically connected with said solenoid, a rocking spindle, an arm secured to and depending from said spindle and spring-urged normally to close the switch, a bell crank to effect rocking of the spindle, and a rocker member carried by said support and operable on movement of the support to a predetermined distance from the position of card delivery thereto to co-operate with said bell crank and effect rocking of said spindle to a position at which said arm is movid thereby to open said switch thereby to render the solenoid inactive and permit the trip member to move to the active position thereof to render the clutch inactive.

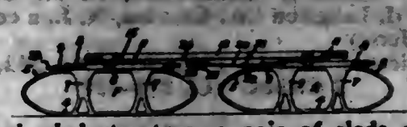
2,771,294
**GAME USING BALL CATCHING AND RELEASING SUCTION DEVICE**
Chester M. MacChesney, Chicago, Ill.
Application June 21, 1955, Serial No. 517,021
6 Claims. (Cl. 273—96)

1. For use in a game comprising a playing surface defined by an outer boundary and divided into two courts, a pneumatic resilient ball adapted to be propelled from one court to the other, and a plurality of combined ball catching and throwing devices, each device comprising flexible suction cups adapted to engage and grip the ball for catching the same, said devices being adapted to be held by the players and having air passages therethrough extending from said suction cups and opening to the atmosphere which may be closed by the hands of the players to effect the gripping of the ball and opened to release the ball for throwing the same.

2,771,295
STYLUS AND SOCKET THEREFOR
Lloyd J. Andres, Chicago, Ill., assignor to Permo, Incorporated, Chicago, Ill., a corporation
Application February 1, 1952, Serial No. 269,406
2 Claims. (Cl. 274—37)

1. A phonograph stylus and tubular socket therefor in combination comprising a tubular socket having a flattened end portion formed with substantially parallel major and minor inner walls of predetermined resilience providing a slot-like opening therein, a stylus member having a flat shank portion at one end and a playing portion at its opposite end, said shank portion having substantially parallel edges and a predetermined width adapted to normally enter said opening a predetermined distance in close proximity with said inner walls, a rigid inclined projection on one side of said shank portion adapted to progressively engage and bend outwardly one said major inner wall when said shank is inserted in said socket whereby said socket will exert holding forces against said projection and said edges at right angles thereto.

2,771,296
CHUCKING MEANS
William B. Retz, Plainville, Conn., assignor to The New Britain Machine Company, New Britain, Conn., a corporation of Connecticut
Application March 17, 1954, Serial No. 416,780
20 Claims. (Cl. 279—74)



1. Chucking means, comprising a tubular body open at both axial ends and having two axially spaced, generally radially directed bores, two jaws separately guided in each of said bores, axially shiftable jaw-actuating means including a first cam surface cooperating with one of said jaws and a second cam surface cooperating with the other of said jaws, both cam surfaces being inclined in the same direction with respect to the chucking axis, said actuating means including differential connections to said jaws, whereby, upon actuation of said actuating means in a single axial direction relative to said body, both axially separate jaws may be actuated in unison.

2,771,297
ADJUSTABLE STOP FOR A COLLET OR THE LIKE
Walter Nipkow, Irvington, N. J.
Application July 7, 1953, Serial No. 367,429
6 Claims. (Cl. 279—109)

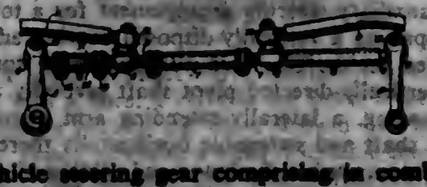
1. A stop adapted to be manually adjustably positioned in the bore of a collet for engagement by a workpiece which is extended a preselected distance into the collet from the front end thereof, the said stop comprising a stop body having a forwardly projecting cylindrical portion and a rear portion providing a hand grip, a pair of rings having eccentrically located openings surrounding the cylindrical portion of the stop body and detachably secured thereto in axially spaced apart locations, a sleeve located between said pair of rings and having an eccentric opening surrounding the said cylindrical portion to provide for free rotation of the sleeve thereon, and a third ring having an eccentric opening surrounding the said sleeve to provide for free relative rotation between said third ring and said sleeve, the stop being positioned in the collet bore by extending the stop body forwardly therein and by a quick turn of the stop body to engage the three eccentric rings with the wall of the collet bore.

2,771,298
HAND BOB SLED
Theodore Francis Crew, Baltimore, Md.
Application November 16, 1953, Serial No. 391,319
1 Claim. (Cl. 280—16)

In a bob sled structure, a pair of sleds of identical construction, comprising spaced parallel runners, a top plate connecting said runners, a top board having its ends disposed one over each of said sleds, stud and socket members connecting the said board ends with the underlying sleds, a rod disposed beneath said top board paralleling the longitudinal center thereof and between said sleds, a connection between the rear end of said rod and the forward end of the rearmost of said sleds, a cleat member having an opening therein secured forwardly of said rearmost sled in the longitudinal center of the undersurface of said top board and loosely receiving the forward end of said rod, a nut threadedly engaged with the forward end of said rod, and an expansion spring interposed between said nut and said cleat.

2,771,299
COMBINATION STOOL AND GAME CARRYING DOLLY FOR HUNTERS
Digby E. Fleshman, Rochester, Mich.
Application April 23, 1954, Serial No. 424,851
6 Claims. (Cl. 280—34)

1. A combination stool and game carrying dolly comprising a pair of peripherally flanged wheels; axle means therefor; cradle means of lesser length than the diameter of said wheels and of less thickness than the combined axial dimension of both wheel flanges; strut means of lesser length than the diameter of said wheels; said cradle means having portions thereof releasably engaged with end portions of said strut means; bracket means extending from said axle means and having portions releasably engaged with the other end portions of said strut means; means releasably locking said strut means in positions



between the cradle means and bracket means; one of the wheels having peripheral inward formed to releasably engage said portions of the strut means and retain the strut means approximately parallel to the wheel axis; whereby said cradle means may be positioned within and between

said wheels in disengaged relation for transportation purposes when said wheels have their flanges engaged, and said strut means may be releasably secured on the one of said wheels in order to utilize said wheel in the formation of a stool.

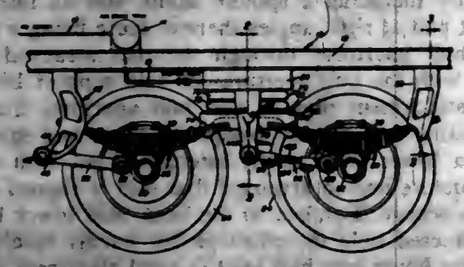
2,771,300
LINKAGE ASSEMBLY FOR VEHICLE STEERING MECHANISM
Josef Latzen, Duisburg-Oberhausen, Germany, assignor to A. Hilgenstock & Cie.
Application August 26, 1953, Serial No. 375,458
Claims priority, application Germany September 5, 1952
4 Claims. (Cl. 280—93)

1. Vehicle steering gear comprising in combination a linkage including at least three longitudinal members and two joint elements disposed between and connecting said longitudinal members in axial alignment to constitute said linkage a continuous unit, a pair of pivot joints, one secured to each free end of said linkage, a guide lever, a drop arm and a pair of track rods; said guide lever and said drop arm being connected to opposite free ends of said linkage each by means of one of said pivot joints; said joint elements being separable units, each presenting a pair of connection members joining a selected two of said longitudinal members and each having a socket joint conformation between said pair of connection members, said track rods being connected to said linkage by way of said socket joints, and said connection members of said joint elements being in the form of studs extending in axial alignment from opposite sides of said joint conformation.

2,771,301
SECTIONALIZED STEERING KNUCKLE
James H. Booth, Detroit, and Albert W. Gale, Fraser, Mich., assignors to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application February 9, 1956, Serial No. 564,499
9 Claims. (Cl. 280—96.2)

6. A steering knuckle assembly comprising a spindle support bridge structure having an inwardly extending integral boss at its upper end and an integral attachment pad at its lower end, there being integral longitudinal reinforcement ribs extending between the boss and the pad, said boss having a tapered hole therethrough for fixedly receiving the stud of an upper arm ball joint, said attachment pad having a generally V-shaped cutout at its lower end and bolt apertures therethrough arranged on either side of said cutout, a separable wheel support spindle structure including a spindle shank and an integral attachment pad at right angles thereto, there being a plurality of bolt apertures through the pad arranged for alignment with the bolt apertures of said support bridge pad, and attachment plate in said bolt apertures fixedly interconnecting said support bridge pad with said spindle structure, a lower boss fixedly interconnected with said spindle structure and so arranged that said V-shaped cutout affords access clearance to the boss, said lower boss having a tapered hole therethrough for fixedly receiving the stud of a lower arm ball joint in axial alignment with the stud of the upper arm ball joint and having a steering arm fixedly interconnected therewith for controlling said spindle.

2,771,302
STEERING ARM, SPINDLE, AND SUPPORT BRIDGE ASSEMBLY
James H. Booth, Venice, and Albert W. Gale, Fraser, Mich., assignors to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application May 2, 1951, Serial No. 224,172
5 Claims. (Cl. 280—96.2)



1. A steering knuckle assembly comprising a spindle support bridge having at its upper end an inwardly extending integral boss and an integral attachment pad at its lower end with integral longitudinal reinforcement ribs extending between the boss and the pad, said boss having a tapered hole therethrough for fixedly receiving the stud of an upper arm ball joint, said attachment pad having two sets of bolt apertures therethrough with a generally V-shaped lower end cutout between the bolt aperture sets, a separable wheel support spindle structure including a spindle shank and an integral attachment pad at right angles thereto with a plurality of bolt apertures through the pad in a pattern similar to that of the bolt apertures in said support bridge pad, a separable member including a lower boss and an integral steering arm with two bolt apertures arranged to register with the two lowermost bolt apertures in said attachment pads, attachment plate in said bolt apertures fixedly interconnecting said support bridge pad with said spindle structure pad and said member with said pads, said V-shaped cutout affording access clearance for said lower boss, said lower boss having a tapered hole therethrough for fixedly receiving the stud of a lower arm ball joint in axial alignment with the stud of the upper arm ball joint.

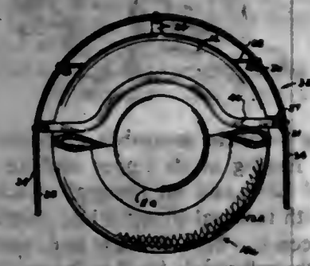
2,771,303
TANDEM AXLE SPRING SUSPENSION UNIT
Van L. Peppler, Royalton, Ill., assignor to Pioneer Tandem Systems, Royalton, Ill., a corporation of Illinois
Application September 8, 1953, Serial No. 378,820
4 Claims. (Cl. 280—104.5)

1. In a vehicle, a frame, tandem axles supporting said frame in part, a semi-elliptical spring secured to each of said axles, each of said springs having one end bearing

directly upon the vehicle frame, a variable rate springing assembly forming bearing means between the opposite ends of said springs and said frame, said spring assembly including a bracket secured to said frame, said bracket having a pair of spaced, depending legs, an abutment member slidably disposed between said legs and upon which said opposite ends of the springs directly bear, an inflatable bag disposed between the upper ends of said

bracket and said abutment member, said bracket legs being provided with vertically elongated, aligned slots, pins carried by said abutment member and projecting through said slots for guiding said abutment member in a vertical path between said bracket legs, and means for varying the volume of working fluid within said inflatable bag, said means including a control valve and an actuating arm connected between said valve and one of said pins.

---



2,771,304

**COMBINED MUD-GUARD AND STONE DEFLECTOR FOR TRUCK TWO-WHEEL ASSEMBLY**

Clarence A. La Pere, Ecorse, Mich.

Application June 14, 1955, Serial No. 515,391

3 Claims. (Cl. 280—152)

1. In a two-wheel assembly at one end of the rear axle in a truck, a vertical standard supported by intermediate means upon the rear axle, a horizontal bar disposed over the axle transversely thereto and supported upon said axle by intermediate means, another or upper horizontal bar extending crosswise to the standard and affixed thereto, a transverse rod extending from each end of the first-named horizontal bar and a similar rod extending from each end of the upper horizontal bar, all the rods extending transversely over the wheels, a rock deflector consisting of a single bar attached at its ends to the lower pair of rods, intermediate their ends, the rod being disposed within the space between the two wheels in a spaced relation to the hub portion thereof, and a sheet metal guard mounted upon said rods, the guard forming a semi-circular structure over the wheels and the deflector therebetween.

---

2,771,305

**MOTORCYCLE SADDLE BAG MOUNTING**

Joseph Bongiolatti, Huntington Woods, Mich.

Application June 21, 1954, Serial No. 438,267

3 Claims. (Cl. 280—289)

1. A saddle bag mounting for motorcycles of the type having a shock absorber mechanism located on the frame at a side of the rear wheel and also having a mud guard for the wheel; comprising a member having a flange extending along and secured to the corresponding side of the mud guard and conforming to the longitudinal curvature thereof, a portion of the same longitudinal curvature extending laterally outward from said flange at the top

and rear of said mud guard and a skirt portion depending therefrom in a plane clearing said shock absorbing mechanism, and means for detachably securing a saddle bag to said skirt adjacent to the outer face thereof.

---

2,771,306

**POWER-ACTUATED LATERALLY AND VERTICALLY ADJUSTABLE DRAFT MEANS**

Charles S. Ash, Detroit, Mich.

Application April 28, 1952, Serial No. 284,844

2 Claims. (Cl. 280—456)

1. An auxiliary steering arrangement for a towing vehicle comprising a vertically-disposed bearing adapted to be mounted on the rearward portion of the towing vehicle, a vertically-directed pivot shaft pivotally mounted in said bearing, a laterally-extending arm connected to said pivot shaft and swingable horizontally therewith, an enlargement secured to the lower end portion of said pivot shaft and swingable horizontally therewith, a draw bar pivotally connected at its forward end to said enlargement for vertical swinging movement relatively thereto, a cylinder bracket secured to the upper end of said pivot shaft and swingable horizontally therewith, a first fluid pressure cylinder pivotally mounted on said cylinder bracket in a rearwardly and downwardly-inclined position and swingable vertically relatively to said bracket, said first cylinder having a reciprocable piston pivotally connected to said draw bar near the rearward end thereof, and a second fluid pressure cylinder having a portion thereof adapted to be pivotally connected to the towing vehicle and having a reciprocable piston therein pivotally connected to the outer end of said arm.

2,771,307

**BANK CHECK**

William F. Farrell, Rochester, N. Y., assignor to Security Trust Company of Rochester, Rochester, N. Y.

Application October 21, 1952, Serial No. 315,939

4 Claims. (Cl. 283—58)

1. A combined master form and bank check comprising a sheet of paper which is scored on two parallel, transverse lines to form three separable sections, one of said sections constituting a check proper having

places for the date, the name of the payee, the sum to be paid, and the signature of the drawer, and having printed matter thereon identifying the drawer, another section constituting a stub by which the check may be bound into a check book, and the third section having control indicia punched therein to control the printing of the first-named section and being adapted to be discarded after use for the printing purpose, said check section proper also being punched with control indicia, said latter control indicia identifying the account of the drawer of the check so that said latter control indicia constitutes sorting control indicia for use after the check has been cashed.

---

2,771,308

**QUICK CONNECT VALVE**

James F. Vitcha, Prairie Village, and Arley C. Hemeyer, Overland Park, Kans., assignors to Puritan Compressed Gas Corporation, Kansas City, Mo., a corporation of Missouri

Application February 23, 1954, Serial No. 412,016

4 Claims. (Cl. 284—19)

1. In a quick connect valve assembly, a valve body provided with a bore; a valve in the bore; a spring in the bore normally biasing the valve toward one end of the bore to a closed position; a stem insertable into the bore at said one end thereof, said stem having an innermost end engaging the valve and holding the latter open against the action of said spring when the stem is in the bore; and double-lock mechanism for said stem including a pair of spaced, external shoulders on said stem spaced from said innermost end of the latter, presenting a pair of grooves, a radially-movable latch plate carried by the body and extending into one of said grooves when the stem is holding the valve open for locking the stem against outward movement, and a radially movable, spring-loaded, ball detent carried by the body between the plate and the valve and extending into the other of said grooves when the stem is in the bore, the detent-receiving groove being longer than the diameter of the detent and the shoulder proximal to said innermost end of the stem being spaced inwardly from the detent when the stem is locked by the latch plate whereby the valve spring closes the valve and forces said innermost shoulder against the detent when the plate is withdrawn from the plate-receiving groove.

---

2,771,309

**UNIVERSAL BALL AND SOCKET JOINT**

Lancaster P. Clark, Jr., Fairfield, Conn., assignor to Clark Metal Products, Inc., Fairfield, Conn., a corporation of Connecticut

Application June 10, 1954, Serial No. 435,744

2 Claims. (Cl. 285—169)

1. A universal ball and socket joint for receiving an electric conductor wire therethrough, comprising a tubular shell member including an upper cylindrical wall portion and a lower cylindrical wall portion of smaller diameter than said upper wall portion and integrally connected thereto by an annular shoulder having its inner edge coincident to the inner surface of said lower wall portion, a coiled wire helical compression spring formed of circular cross-section wire disposed within said upper wall portion and seated upon said annular shoulder, the radius of the coils of said spring to the center of the wire being less than the radius of said inner edge of said shoulder, a socket member disposed within said upper socket portion including an upper substantially hemispherical socket portion engaged at its outer surface with the upper end of said spring, and a cylindrical tubular portion fitted within and extending below the lower end of said spring to support the coils thereof against inward displacement, the annular space between said tubular portion and the inner edge of said shoulder being of less radial dimension than the thickness dimension of said wire of said spring, and a ball member having a wire receiving passage therethrough and including a truncated

ball portion seated for swivelling movement upon the inner surface of said socket portion of said socket member and an upper externally threaded portion extending upwardly from said upper wall portion of said shell member, the upper side of said upper wall portion being extended inwardly to engage the upper surface of said ball portion along a circular line of less diameter than the diameter of said ball portion with said spring held under compression through said engagement of said inwardly extended edge with said ball portion, and said lower wall portion of said tubular shell member extending substantially below the lower end of said cylindrical portion of said socket member and having internal screw threads of matching pitch and diameter to said external screw threads of said ball member.

---

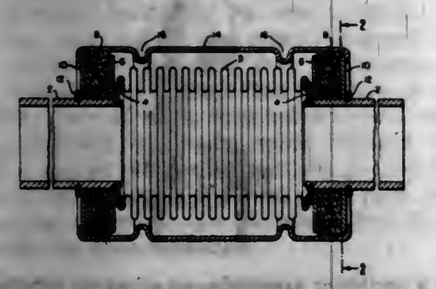
2,771,310

**ROTARY SPRINKLER SWIVEL WITH THRUST BEARING ASSEMBLY**

John A. Royer, William S. Kinsbro, and Harry D. Jacoby, Fresno, Calif., assignors to Buckner Manufacturing Company, Inc., Fresno, Calif., a corporation of California

Application May 2, 1955, Serial No. 505,338

4 Claims. (Cl. 285—279)



4. In a sprinkler assembly, an elongate tubular bearing housing adapted for connection at its lower end to a water supply riser, a hollow spindle journaled for rotation within said housing, said spindle having upper and lower end portions projecting beyond respective ends of said housing, the lower end of said spindle terminating in an enlarged shoulder presenting a flat, annular and upwardly facing thrust surface and the lower end of said housing presenting a flat, annular and downwardly facing thrust surface, combined bearing and sealing means sandwiched between said thrust surfaces and constituting the sole means for limiting axial upward movement of said spindle with re-

spect to said housing, a hollow discharge member secured to the upper end portion of said spindle and rotatable in response to the flow of water outwardly therethrough, said discharge member being spaced from the upper end portion of said housing to permit limited relative sliding movement between the housing and the spindle, said rotary discharge member being of the type having a restricted discharge orifice so that water under pressure passing upwardly through said spindle from the riser and forced outwardly of the discharge member through the restricted discharge orifice therein will impart a lifting force upon said spindle to compress said combined bearing and sealing means and maintain the same in sealing relation with said thrust surfaces, said combined sealing and bearing means including a pair of stacked and sealingly interengaged annular washers surrounding said spindle and effecting a seal between said thrust surfaces, said washers being of rectangular cross section and of substantially the same outer diameter, one of said washers being of soft rubber material and the other washer being of hard plastic material of Teflon or the like, said discharge member being recessed at its lower end and receiving the upper end of said housing and presenting a downwardly facing thrust shoulder surrounding such recess, said housing having an upwardly facing thrust shoulder disposed in spaced relation to the thrust shoulder on said discharge member, and an upper seal assembly embracing the upper portion of said housing and engaging the thrust shoulder of said discharge member, said upper sealing assembly including a plastic washer engaging said thrust shoulder of the discharge member, a resilient rubber washer sealingly embracing the upper portion of said housing and sealingly engaged against the undersurface of the plastic washer and a spring seated upon the thrust shoulder of said housing and bearing upon the undersurface of the rubber washer to urge the same upwardly against the plastic washer to maintain the latter in sealed engagement with the thrust shoulder of said discharge member and simultaneously urge the spindle upwardly with respect to the housing to normally effect a seal between the washers of the said combined sealing and bearing means in the absence of water under pressure in said riser.

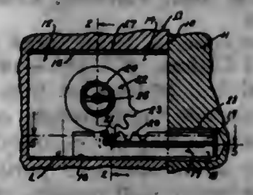
**2,771,311**
**BELLOWS EXPANSION JOINT WITH SEALED CASING**
**Frederick W. Hottenroth, Jr., Newton, Mass., assignor to Standard-Thomson Corporation, Boston, Mass., a corporation of Delaware**
**Application March 4, 1953, Serial No. 340,211**
**2 Claims. (Cl. 285—299)**

2. An expansion joint for a fluid conduit comprising, in combination, an expansible bellows, a pair of tubular members joined to the ends of the bellows, a fiber washer surrounding each of said tubular members adjacent an end of the bellows, said washers being formed of annular laminae of fibrous composition adapted to expand radially upon contact with the fluid in the conduit, means to constrain the washers against sliding longitudinally on said tubular members, and a tubular closure surrounding the bellows and enclosing the washers, said closure being freely slidable over the washers when the washers are dry, whereby upon occurrence of a leak in the bellows, the washers are exposed to the fluid and expand to form seals with the closure.

---



**2,771,312**
**RUBBER BUSHING**
**Leon F. Thiry, Chagrin Falls, Ohio**
**Application August 16, 1952, Serial No. 304,685**
**4 Claims. (Cl. 287—85)**

1. A resilient mounting adapted to sustain radial, axial and oscillating loads comprising an outer rigid member having at opposite ends of a cylindrical bore annular abutment surfaces extending transversely to the axis of the bore, and a co-axial longitudinally extending rigid inner member having intermediate its ends a substantially continuous cylindrical surface of uniform diameter throughout, and compression members secured to said inner member and spaced axially from said abutment surfaces of said outer member and an annular rubber-like bushing fitted between and adhering to said members in pressure friction engagement and completely filling the space between the said inner and outer members, said bushing being characterized by having intermediate its ends a tubular portion of substantial length, said tubular portion of the bushing having in its free state a bore diameter substantially less than the diameter of the cylindrical surface of the inner rigid member and having in its dilated state, prior to the application of axial pressure to the mounting, substantially a right circular lateral surface with a diameter slightly less than the diameter of the bore of the outer rigid member, and said bushing also having at one end an integral flange extending outwardly of the tubular portion and being adapted to contact an abutment surface of the outer member, said bushing having, in its dilated state upon the inner member and prior to assembly, at the end of the tubular portion opposite the flange, an annular end portion having an outer diameter less than the inner diameter of the bore of the outer member with said annular end portion having sufficient volume so that when the said compression members associated with the inner member are adjusted inwardly on said member after the inner member has been disposed within the bore of the outer member, the tubular portion of the bushing receives an additional dilation bringing it into pressure friction engagement with the bore of the outer member and with a shoulder flange being formed at the end of the tubular portion opposite the first mentioned flange.

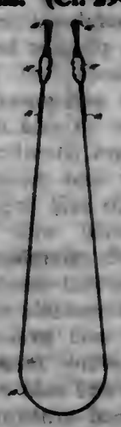
---

**2,771,313**
**CLOSURE FASTENER**
**Nicholas M. Blake, Oshkosh, Wis.**
**Application December 2, 1954, Serial No. 472,637**
**2 Claims. (Cl. 292—142)**

1. In a combination storm and screen door, a positive acting lock for securing a removable panel in said door including a casing having spaced parallel side walls and top and bottom walls, a bolt mounted in said casing

slidably mounted on the bottom wall and said bolt having a lower longitudinally extending rib and an upper offset longitudinally extending rib terminating short of the inner end of said bolt, said upper rib being provided with rack teeth, a pinion disposed in said casing having a laterally projecting bearing hub provided with a diametrically extending tool receiving slot, an apertured bearing boss struck in from one side wall of the casing rotatably receiving the hub and engaging one face of the pinion, the opposite face of said pinion engaging the other side wall of the casing, said pinion having radially extending cogs around the periphery of the pinion for a portion of the circumference of said pinion for sliding said bolt upon turning of the pinion, the inclined face of the innermost tooth of the rack teeth tending to move the pinion laterally into binding engagement with a side wall of the casing when a cog of the pinion forcibly engages said inclined face.

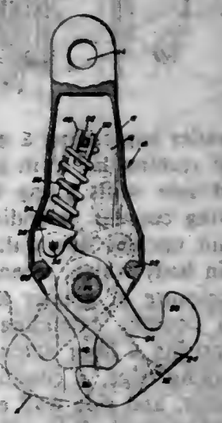
---



**2,771,314**
**WRAP-AROUND CAR SEAL**
**George G. Canter and Gilbert G. Canter, New York, N. Y.**
**Application August 7, 1953, Serial No. 372,878**
**2 Claims. (Cl. 292—315)**

1. A seal comprising a strap of sheet metal having a transversely slotted head at one end and a tongue adapted to pass through the slot in the head at the other end, said tongue being narrower than said strap to provide a shoulder adapted to engage said head when said tongue is fully inserted in said slot, said head having at its end an edge spaced from said slot and disposed slanted with respect to the longitudinal axis of the strap, and said tongue having a score line so located relative to said shoulder as to be in alinement with said edge when the tongue is fully inserted in said slot.

---



**2,771,315**
**HOISTING SLING**
**Francis F. Fenwick, South Orange, N. J.**
**Application February 18, 1955, Serial No. 489,138**
**6 Claims. (Cl. 294—74)**

1. A hoisting sling comprising a body provided by a strip of flexible material of selected length, width and thickness, said body having inwardly of its respective extremities a pair of longitudinally spaced apart slits, disposed intermediate and parallel to its side edges whereby to form separated sections bordering opposite sides of the respective slits, each end portion of the body being longitudinally folded upon itself midway of said slits therein, to form an end loop and so as to register said slits in opposed aligned relation with bordering sections at corresponding sides thereof disposed in contiguous face to face relation, and said respective face to face bordering sections being twisted upon themselves by rotating the end loop through said slits thus forming therein intertwined helical convolutions which unite the legs of the end loop in closed together and secured relation to the sling body.

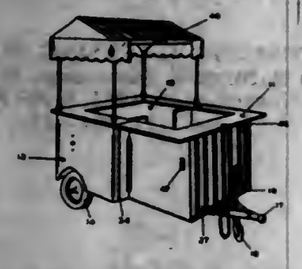
---

**2,771,316**
**AUTOMATIC RELEASING HOOK**
**John H. Mitchell, Montesano, Wash.**
**Application November 16, 1953, Serial No. 392,277**
**5 Claims. (Cl. 294—83)**

1. An automatic releasing mechanism for hoisting comprising a hollow frame, a hook member pivotally secured to said frame, said frame including a pair of sling lifters extending on either side of said hook, stop members in said frame, and resilient snap action means for urging said hook against a selected one of said stop members, said snap action means including a piston pivotally attached to said hook member, a stop element attached to said frame, said piston having a shoulder, and resilient means yieldably engaging and extending between said shoulder and said stop element.

---

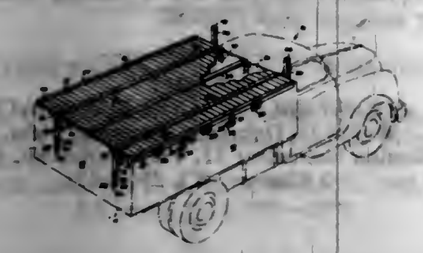
**2,771,317**
**ADJUSTABLE WAGON BOX BRACE**
**Walter H. Dohrmann, Emerson, Nebr.**
**Application November 23, 1954, Serial No. 470,763**
**2 Claims. (Cl. 296—15)**



1. The combination with a vehicle supported grain holding box including a platform and a side wall carried by said platform adjacent a side edge thereof, of an upstanding brace arranged exteriorly of and abutting said side wall and secured to said wall, the lower end of said brace being spaced above said platform, a horizontally disposed foot plate secured to the lower end of said brace, a bolt supported in said foot plate and extending through said platform and adjustably secured to the latter, a second bolt spaced from said first bolt and extending

through said foot plate and having a head resting upon said platform, and a nut in threaded engagement with said second bolt and having its upper face bearing against said foot plate.

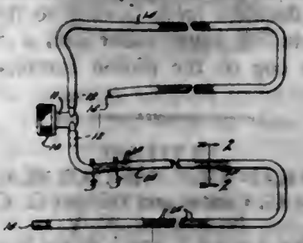
---



2,771,318
VENDING TRAILER
Carl F. Jagsch, Columbus, Ohio, assignor to Timmons Metal Products Co., Columbus, Ohio, a corporation of Ohio
Application December 29, 1954, Serial No. 478,309
8 Claims. (Cl. 296—22)

1. A serving trailer comprising a main body providing a compartment of rectangular form having a rectangular floor and upright side walls along three edges thereof with a fixed serving counter extending along the upper edge of all of said upright side walls, hinged extension parts on said main body which, when unfolded, will provide a service enclosure of greater area than said compartment with a counter extending completely thereabout and comprising a floor extension hinged to said floor at its remaining edge, a counter extension hinged to said fixed counter, and side wall extensions hinged to said side walls and movable between said counter extension and said floor extension to support the counter extension at the same level as said fixed counter.

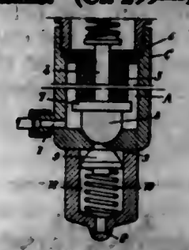
---



2,771,319
COMBINATION TRUCK BODY AND FLEXIBLE COVER THEREFOR
Mervin J. Rengquist, Julesburg, Colo.
Application March 7, 1955, Serial No. 492,464
4 Claims. (Cl. 296—100)

1. A combination rectangular housing and cover therefor comprising a bottom wall, parallel opposite side walls extending upwardly from said bottom wall, parallel opposite end walls joining the opposite ends of said side walls and extending upwardly from said bottom wall, a plurality of slats each having its opposite ends supported on the respective upper edge of said opposite side walls, said slats being positioned in closely adjacent side to side relation to each other whereby said housing is substantially completely covered, an elongated plate hingedly secured to the outer face of each of said side walls adjacent the upper edges thereof, an elongated member integrally secured to each of said plates and extending perpendicularly therefrom, said members being adapted to overlie the ends of said slats securing said slats against the top edge of said side walls, said plates and said members being adapted to be pivoted outwardly to a position out of contact with said slat ends, means on said side walls for releasably securing said plates and said members in slat overlying position, a flexible connector extending parallel to said side walls, said connector overlying each of said slats, means securing said connector to each of said slats, said connector extending beyond said slats to overlie one of said end walls of said container, means on said one end wall for detachably securing the end of said connector thereto, and means on the other end of said end walls for supporting said slats in rolled position.

---

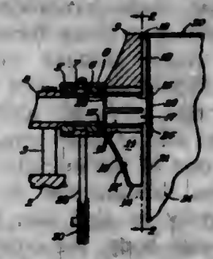


2,771,320
SPRINKLING SYSTEM
John J. Korwin, St. Clair Shores, Mich.
Application November 4, 1952, Serial No. 318,575
12 Claims. (Cl. 299—104)

10. A liquid spray sprinkling device comprising a length of flexible hose having an expansible, homogeneous, wall structure formed of a resiliently elastic compound, said wall structure having integrally formed therein and closely spaced lengthwise of and circumferentially about the hose a plurality of puncture type, expansible, self restricting, liquid spray producing orifices that are bounded and yieldably restricted by only the adjacent resiliently elastic compound of the hose wall structure.

---

2,771,321
FUEL INJECTORS
Gustave Alric, Soists-Savine, France
Application September 24, 1954, Serial No. 458,036
Claims priority, application France September 26, 1952
7 Claims. (Cl. 299—107.6)



1. A fuel injector which comprises, in combination, rigid casing means shaped to form a pressure chamber adapted to be fed periodically with successive quantities of fuel, a discharge chamber provided with at least one injection orifice, and a passage between said two chambers, whereby fuel flows first through said pressure chamber, then through said passage and finally through said discharge chamber to said injection orifice, means movable in said pressure chamber to make the volume thereof variable, valve seat means forming the end of said passage adjacent to said pressure chamber, a main valve member connected with said movable means located in said pressure chamber and arranged to cooperate with said valve seat means to open said end of said passage when said movable means are moved to increase the volume of said pressure chamber, resilient means for urging said valve member toward said valve seat means, said valve and said valve seat being shaped to cause a predetermined pressure rise in said pressure chamber to lift said valve member away from said valve seat means, i. e. toward the inside of said pressure chamber, against the action of said resilient means, valve seat means forming the other end of said passage adjacent to said discharge chamber, an auxiliary valve member in said discharge chamber mounted to cooperate with said second mentioned valve seat means to control the communication between said passage and said injection orifice, and resilient means for urging said auxiliary valve member toward said second mentioned valve seat means, the force of said last mentioned resilient means being lower than the force exerted on said auxiliary valve member by the pressure existing in said passage after the opening of said main valve member by said predetermined pressure rise in said pressure chamber.

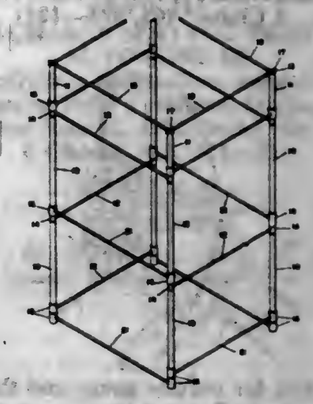
2,771,322
PNEUMATIC CONVEYOR FOR COTTON PICKERS
Ivan E. Sunsey, Memphis, Tenn., assignor to International Harvester Company, a corporation of New Jersey
Application August 26, 1955, Serial No. 530,783
10 Claims. (Cl. 302—37)

1. A pneumatic conveyor comprising a tubular duct having an outlet end portion, a rotor structure including an eye disposed in axial alignment with said end portion and having one end located in receiving relation to said duct for drawing material entrained air from said duct, a closed receptacle communicatively associated with the opposite end of said eye for receiving material moving through said eye, and said rotor structure having a plurality of blades formed and arranged to provide radial blower passage through said rotor and having inlets communicating with said eye about the periphery thereof and outlets about the outer periphery of said rotor.

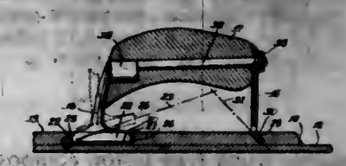
---

2,771,323
STANDPIPE FLOW CONTROLS
Theodore C. Taylor, Columbus, Ohio, assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application February 20, 1953, Serial No. 337,917
13 Claims. (Cl. 302—57)



1. A system for transferring fluidized solids by means of a standpipe and a transfer line containing a carrier gas which includes a transfer line, a standpipe for fluent solids extending downwardly from a vessel and discharging into said transfer line, a control valve in said standpipe, a first pressure-sensitive controller downstream of said standpipe and actuated by pressure in said transfer line to operate said control valve, a throttle valve on said transfer line upstream from said standpipe, a second pressure-sensitive controller on said transfer line downstream of and operating said throttle valve, a pressurizing reservoir in pressure communication with said transfer line upstream of said throttle valve, a plurality of vertically spaced jackets about ports in said standpipe, and a plurality of conduits communicating between said pressurizing reservoir and said vertically spaced jackets on said standpipe.

---

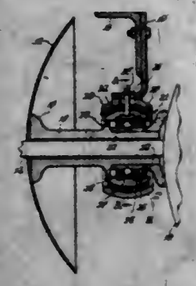


2,771,324
DEMOUNTABLE SCAFFOLD
Reginald D. Ryder, Bradner, Ohio, assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application February 26, 1954, Serial No. 412,970
4 Claims. (Cl. 304—2)

1. A scaffold of successive tiers comprising a base tier of interchangeable corner posts, first type ledger members with hub ends of an internal diameter equal to the external diameter of the corner posts positioned to receive and hold said corner posts in the hubs; and additional tiers including a pair of second type ledger members with hub ends of an internal diameter equal to the internal diameter of the corner posts placed on top of opposed pairs of corner posts, pin members extending through the hub ends extending above and below the same holding the corner posts below and positioned to receive corner posts above said hubs, and a pair of ledger members with hub ends of internal diameter equal to the external diameter of the corner posts connecting corners unconnected by said first pair of ledger members and transverse thereto, and corner posts inserted in said pair of first type ledger member hubs to embrace the pin members positioned by the pair of second type ledger members reinforcing the corners of successive tiers of the scaffold.

---

2,771,325
CEMENT MASON'S FLOAT
Leigh S. Brunson, Milwaukee, Wis.
Application June 8, 1953, Serial No. 360,060
2 Claims. (Cl. 306—44)



1. A cement mason's float comprising a blade portion and a handle portion, said blade portion comprising a flat blade having a central longitudinally extending upstanding reinforcing rib integrally formed on its upper surface, said rib having a front socket comprising a longitudinally extending recess and a bore extending longitudinally and downwardly from one end of said recess, and a rear socket longitudinally spaced from the front socket and comprising a bore extending downwardly and longitudinally in the opposite direction from said first-mentioned bore, said handle portion comprising a front support having a base seated in said recess and a pin projecting from one end of the base and extending into said first-mentioned

bore, a rear support having a pin on its lower end extending into said second-mentioned bore, and a handle rigidly clamped between the supper ends of said supports and holding said supports against movement relative to each other.

2,771,326
BEARING
Hiram P. Smith, Stockton, and Richard W. Kramer, Modesto, Calif., assignors to International Harvester Company, a corporation of New Jersey
Application April 29, 1954, Serial No. 426,405
1 Claim. (Cl. 308—181)

In a mounting for harrow gangs and the like wherein a disk-carrying spool is rotatably mounted on a supporting frame, an anti-friction bearing having an inner race surrounding the spool and mounted thereon for rotation therewith and an outer race, a metal sealing ring mounted on the outer race of said bearing having an arcuate outer periphery forming part of a sphere having its center on the axis of said bearing, a housing surrounding said metal sealing ring having an arcuate inner surface spaced from and concentric with the outer surface of the metal ring, a cylindrical rubber sleeve of uniform diameter compressed between the ring and the housing and conforming to the shape thereof, and means for securing the housing to the frame.

---

2,771,327
PISTON CONSTRUCTION
William C. Reinberger, Middleburg Heights, Ohio, assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application August 17, 1953, Serial No. 374,747
10 Claims. (Cl. 309—12)

1. An expansible trunk type piston composed of metal having a high rate of heat expansion which comprises a head portion, a depending ring flange portion integral with said head portion, a skirt portion thinner than the ring flange portion extending intgrally therefrom, and wrist pin bosses depending integrally from said head portion inwardly of said skirt and coacting therewith to form channels between said bosses and said skirt said piston having an internal shoulder between the ring flange and the skirt portions in communication with said channels, and a ferrous metal control ring having a lower rate of heat expansion than the piston material bottomed on said shoulder, said control ring controlling the expansion of the piston under varying temperature conditions.

2,771,328
PISTON RING GROOVE PROTECTOR
William N. Wainwright, Kirkwood, William M. Veaner, Brentwood, and Percy L. Bowser, Jr., Ladue, Mo., assignors to Sterling Aluminum Products, Inc., St. Louis, Mo., a corporation of Missouri
Application February 27, 1956, Serial No. 567,942
14 Claims. (Cl. 309—14)

14. A piston, comprising, an aluminum body provided with a packing ring-receiving groove, and an annular disc of a metal harder than aluminum and extending around said body axially adjacent said groove and radially within the aluminum body, the outer margin of said disc extending into said groove to face the same, said disc having recesses extending circumferentially therealong and therethrough and said disc being formed to cause the aluminum to flow axially through said recesses, said recesses being of sufficient dimensions circumferentially and radially of said disc to permit molten aluminum to flow therethrough and said recesses being positioned radially with respect to one of the margins of said disc and so formed that upon solidification the aluminum will shrink radially inwardly on said disc in order to cast-anchor said disc in said body, the outer margin of said disc extending radially beyond said body to locate said disc in a mold during casting of said body.

---

2,771,329
COMPOSITE PISTON RING
Helmuth G. Braendel, Tredyffrin Township, Chester County, Pa., assignor to Wilkening Manufacturing Company, Philadelphia, Pa., a corporation of Delaware
Application January 24, 1951, Serial No. 207,585
4 Claims. (Cl. 309—45)

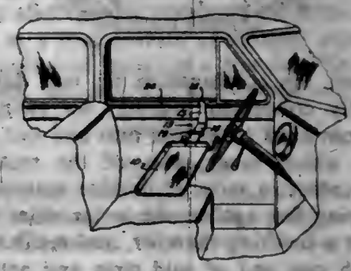
1. A composite multi-piece piston-ring for use in and with the cylinder and piston of internal combustion engines and the like, said composite multi-piece piston-ring comprising a pair of flat spaced-apart parallel conformable and circumferentially non-compressible metal cylinder-contacting ring-elements the combined axial thickness of the cylinder-contacting faces of which is substantially less than the axial width of said composite piston-ring and whose outer side-surfaces constitute the outer side-surfaces of said piston-ring, said ring-elements having continuous cylinder-contacting surfaces except for a single interruption of each, means spacing apart said flat cylinder-contacting ring-elements in relation to each other, a generally annular circumferentially compressible axially corrugated resilient non-bottoming expander interrupted at one point and formed of a flat band of spring-steel of oblong cross-section whose major dimension is disposed radially of said piston-ring and whose minor dimension is disposed at a right angle to its major dimension, said expander having axially disposed abutting tabs which are in free abutted and unconnected relationship to each other when said composite piston-ring is installed in the ring-receiving groove of a piston in a cylinder, and the radial width of said expander being substantially greater than one-half the radial clearance between the inner axially disposed wall of the ring-receiving groove of said piston and the effective inner peripheries of said cylinder-contacting ring-elements, and the length of the cycle of said corrugations being approximately of the order of the axial width of said expander and said corrugations having curved crests of generally uniform height and lying in the same general cylindrical formation in which the expander as a whole lies.

---

2,771,330
TILTING MECHANISM FOR X-RAY EXAMINATION TABLE
Willem Zaalberg, Leiden, Netherlands, assignor, by mesne assignments, to Smit-Roentgen N. V., Leiden, Netherlands, a limited liability company of the Netherlands
Application July 6, 1954, Serial No. 441,513
Claims priority, application Netherlands July 8, 1953
1 Claim. (Cl. 311—6)

In an X-ray examination table the combination of a base, a support pivotally mounted on said base, a table slidable in its longitudinal direction on said support, the pivotal mounting of said support being horizontal and perpendicular to the longitudinal direction of said table and being located at a height above said base which is less than half the length of said table, an electric motor mounted on said table, a worm actuated directly by said electric motor rotatably mounted on said support, a toothed segment in the form of a sector concentric to said pivot and fixed to said base, said toothed segment comprising a ring gear having teeth on the outer circumference thereof engaged with said worm, and having teeth on the inner circumference thereof, a toothed rack mounted longitudinally of said table, a smaller and a larger pinion fixed to each other and rotatably mounted on said support, said smaller pinion engaged with the inner circumference of said toothed segment and the larger pinion engaged with said rack, whereby actuating said worm effects tilting of the table about said pivot by action on said toothed segment and rectilinear displacement of the table relative to the support in a direction tangential to the toothed segment by action on said smaller and larger pinion.

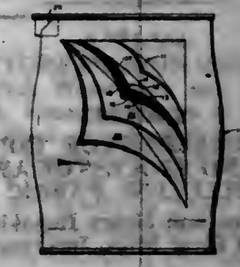
---



2,711,331
FOLDING TYPEWRITER DESK FOR AUTOMOBILES
Arthur Mesaman, Enid, Okla.
Application January 26, 1955, Serial No. 484,206
6 Claims. (Cl. 311—21)

1. The combination with an automobile having an instrument panel, of a foldable table having inner and outer substantially rectangular sections, a foldable Y-shaped table support including a single leg to engage the floor of the automobile, means pivotally connecting said support to the bottom of the outer section along its outer longitudinal edge for folding against the same with the leg extending longitudinally of the section, means hingedly connecting adjacent longitudinal edges of the two sections whereby the outer section may fold downwardly under the inner section with the folded leg between them, means hingedly connecting the other longitudinal edge of the inner section to the instrument panel whereby the folded sections may be swung downwardly under that panel with their hingedly connected edges lowermost, and a spring clip carried by a fixed portion of the automobile for engagement with the hingedly connected edges of the sections to hold them in such folded position under the instrument panel.

---

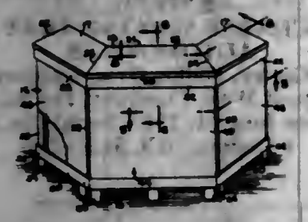


2,771,332
DETACHABLE SERVING TRAY FOR AUTOMOBILES
William L. McGinley, Dallas, Tex., assignor to American Permanent Wear Company, Dallas, Tex.
Application June 11, 1953, Serial No. 360,994
6 Claims. (Cl. 311—21)

1. In an automobile service tray, a mounting for supporting said tray in relation to a window of said automobile, comprising a single goose-neck having a first horizontal portion affixed to and extending from one end of said tray, an upwardly and outwardly extending angular portion terminating in a second horizontal portion, a hook pivotally connected to the end of said second horizontal portion and engageable in the glass channel of a window of said automobile, a bracing member comprising a flattened loop slidably embracing said first horizontal portion of said goose-neck and having a depending portion carrying spaced apart legs at right angles to said depending portion whose ends are in abutting relationship with said automobile below said window when said tray is in operative position, said loop being disposed at an angle to said depending portion to frictionally engage the upper and lower surfaces of said first horizontal portion of said goose-neck to preclude horizontal sliding displacement of said loop in tray supporting position of said bracing member.

---

2,771,333
CONTAINER FOR DELIQUESCENT MATERIALS
Jack F. Eberle, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application October 16, 1951, Serial No. 251,594
7 Claims. (Cl. 312—31)

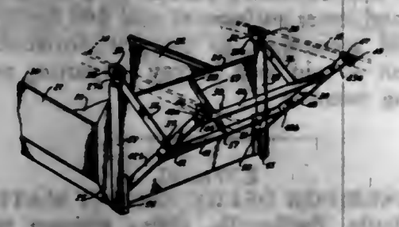


1. A fertilizer bag formed by a first and innermost wall pervious to moisture, a second wall in close spaced relation to said first wall and a third and outermost wall in close spaced relation to said second wall, an adhesive coating covering the inner surface and outer surface of

said second wall, a moisture absorbing desiccant impregnated on, and supported by, said inner surface adhesive coating, and a moisture barrier type desiccant impregnated on, and supported by, said outer surface adhesive coating.

---

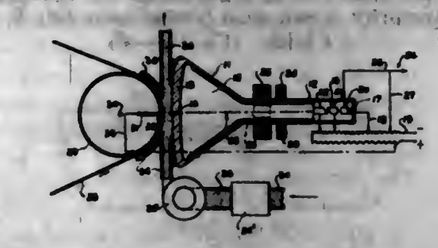
2,771,334
**PORTABLE BAR**
Ernest T. Wahlbom, Rockford, Ill., assignor of one-half to Bennett T. Griggs, Rockford, Ill.
Application June 11, 1953, Serial No. 360,880
8 Claims. (Cl. 312—140.4)



5. In a bar, the combination of, two flat frame sections pivotally connected together for swinging toward and away from each other and into and out of collapsed positions in which inner sides of the sections lie flat against each other, a strip of flexible material extending along and lying flat against the outer sides of said sections to form a covering therefor, and resilient means engageable with one end of said strip and acting between the latter and said sections to hold the strip taut against said outer section sides and urge the sections yieldably toward each other and into their collapsed positions, said strip being slidable relative to and along the outer side of one of said sections to permit swinging of the sections into said collapsed positions thereof.

---

2,771,335
**REAR-END SUSPENSION SYSTEM FOR DRAWERS AND THE LIKE**
Hans W. Regenhardt, Wooster, Ohio, assignor to Record Files, Inc., Wooster, Ohio, a corporation of Ohio
Application December 8, 1954, Serial No. 473,841
12 Claims. (Cl. 312—342)



1. In a file cabinet or the like, a drawer suspension

system comprising a panel adapted for bodily movement in a direction paralleling one of the major axes of the cabinet; a moveable frame member extending transversely of said axis; parallel links coupling the frame member to the panel; ways on the panel; and, for imposing sliding movement on the adjoining portion of the frame member, means on the frame member cooperating with the ways on the panel.

---

2,771,336
**IMAGE CONTROL TUBE AND METHOD OF PRINTING**
Jack E. MacGriff, Detroit, Mich.
Application February 14, 1952, Serial No. 271,579
7 Claims. (Cl. 346—74)

1. In an image control cathode ray tube, an evacuated glass envelope having an elongated cylindrical shank closed at one end and having an enlarged portion at its other end terminating in an end face at right angles to the longitudinal axis of said shank, an electron gun assembly within the closed end of said shank, a plurality of straight elongated spaced conductors within said end face parallel to said longitudinal axis and arranged in a row, a deflection yoke surrounding said shank adjacent said enlarged portion exteriorly energized electrically to produce a continuously changing field, the electron beam from said gun assembly being deflectable from a path in alignment with said longitudinal axis for transversely scanning said row of conductors throughout its length for separate transmission through each of said conductors to the exterior of said tube, a stationary electrode blade spaced from the face of said tube on its exterior and arranged parallel to and opposite from said row of conductors, a moving web of image receiving material positioned between said blade and said row of conductors in spaced relation, and a confined smoke pigment of constant density between said row of conductors and said web, whereby the scanning electron beam as it passes through said conductors successively to said blade carries particles of said pigment to said web for impingement thereon in a permanent manner, to thereby form a row of pigmented elements and a plurality of such rows upon continued movement of said web, the quantity of particles deposited in a row upon said web corresponding proportionately to the quantity of electrons passed through a particular conductor controlled by the instantaneous image signal applied to said electron gun assembly.

## CHEMICAL

2,771,337
**ACROLEIN-FORMALDEHYDE CONDENSATION PRODUCTS AND PROCESS OF APPLYING THE SAME TO CELLULOSE FABRIC**
Dmitry M. Gagarine and Henry Repokis, Danville, Va., assignors to Dan River Mills, Incorporated, a corporation of Virginia
No Drawing. Application May 3, 1952, Serial No. 286,038
11 Claims. (Cl. 8—116.4)

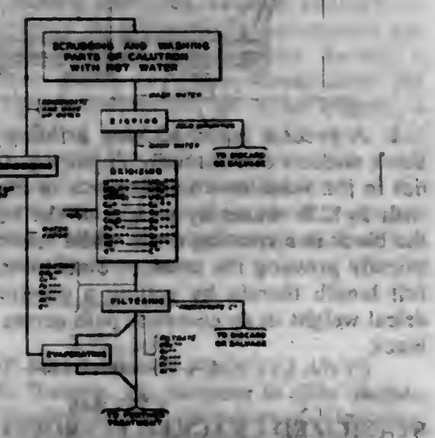
7. A water-soluble reaction product of about 1 to 10% by weight of a starch, one mol of acrolein, and from about one to six mols of formaldehyde condensed in the presence of a small percentage less than 5% of a basic catalyst.

11. A process of cross-linking cellulose which comprises impregnating substantially alkali-free cellulose with an aqueous solution containing from about 5% to 50% of a water-soluble reactive chemical which is the condensation product of one mol of acrolein and from about one to six mols of formaldehyde condensed in the presence of a small percentage less than 5% of a basic catalyst, said solution also containing from about .1% to 5% of an acidic catalyst, and heating the thus impregnated cellulose at a time and temperature sufficient to dry it and to cause reaction between said cellulose and said chemical.

---

2,771,338
**MANUFACTURE OF URANIUM PEROXIDE**
Louis Spiegler, Woodbury, N. J., assignor to the United States of America as represented by the United States Atomic Energy Commission
No Drawing. Application March 15, 1945, Serial No. 582,996
5 Claims. (Cl. 23—14.5)

1. In the recovery of uranium peroxide by precipitation from a uranyl sulfate solution containing magnesium and fluorine, the improvement which comprises effecting the uranium peroxide precipitation in the presence of dissolved ammonium sulfate and promptly separating the uranium peroxide from mother liquor.



---

2,771,339
**PROCESSES FOR THE RECOVERY AND PURIFICATION OF URANIUM**
Robert Q. Boyer, Berkeley, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application September 2, 1944, Serial No. 552,548
10 Claims. (Cl. 23—14.5)

1. In a process for reclaiming uranium values from deposits formed on the parts of a calutron during the operation thereof, the steps comprising washing said parts with an aqueous solvent to form a solution containing said values and impurities, treating said solution with ammonium hyposulfite to reduce said uranium and a portion of the impurities, treating said reduced solution with formaldehyde to complex and immobilize the sulfite formed during said reduction, then treating said solution with ammonia to precipitate uranous hydroxide away from the impurities in the solution, and separating said uranous hydroxide precipitate from the solution.

---

2,771,340
**IMPROVED URANIUM RECOVERY AND PURIFICATION PROCESSES**
Martin D. Kamen, Berkeley, Calif., and Abel De Haas, Jr., Oak Ridge, Tenn., assignors to the United States of America as represented by the United States Atomic Energy Commission
Application June 27, 1944, Serial No. 542,378
10 Claims. (Cl. 23—14.5)

7. The process for recovering metallic uranium isotope 235 values from deposits formed with a metal surface containing metals of the group consisting of iron, chromium, nickel and copper, comprising washing said surface with an aqueous solution containing about 2% of HCl and about 0.5% of $H_2O_2$ to produce an acidic chloride solution containing uranyl ions and the ions of said metals as impurities, adjusting the hydrogen ion content of the solution to the range 1N to 3N, treating said solution to reduce the uranyl ions to the uranous state, treating the reduced solution with oxalic acid to precipitate uranous oxalate away from the impurities in the solution, and separating said uranous oxalate from the solution.

---

2,771,341
**METHOD FOR GAINING VANADIUM VALUES FROM VANADIUM CONTAINING IRON ORES**
Otto F. F. Barth, Stocksund, Sweden, assignor to Hoganäs-Billesholms Aktiebolag, Höganäs, Sweden, a company of Sweden
No Drawing. Application July 17, 1951, Serial No. 237,295
2 Claims. (Cl. 23—51)

1. Process for the recovery of vanadium from vanadium containing iron ore which comprises mixing ingredients consisting essentially of such iron ore in finely divided form and an alkali metal compound, sintering the resulting mixture at a temperature of at least about 1100° C. for the production of lumps of a size suitable for charging a blast furnace, and leaching said lumps with water.

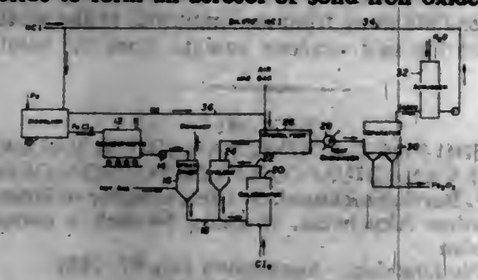
---

2,771,342
**PRODUCTION OF NON-CAKING COPPERAS**
Stephen A. Lamanna, Amherst, Va., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application December 2, 1953, Serial No. 395,854
3 Claims. (Cl. 23—126)

1. Process for the preparation of copperas in dry, free-flowing form from wet copperas crystals carrying dilute sulfuric acid, which comprises drying said copperas to an $FeSO_4$ content of between about 56% and 60% at a temperature below the melting point thereof, and then blending the thus-dried crystalts with a finely divided calcium carbonate in effective anti-caking amount.

---

2,771,343
**METHOD FOR STABILIZING HYDRAZINE AGAINST DECOMPOSITION BY COPPER IN CONTACT THEREWITH**
Orlan M. Arnold, Grosse Pointe, and Robert M. Jamison, Detroit, Mich., assignors to Olin Mathieson Chemical Corporation, a corporation of Virginia
No Drawing. Application December 23, 1953, Serial No. 400,128
6 Claims. (Cl. 23—190)

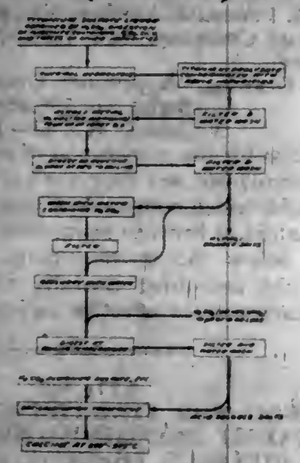


1. A method for retarding the autoxidation of hydrazine by copper in contact therewith which involves repressing the dissolution of copper in the hydrazine by including in a concentration of at least 0.001 mole a solute of a compound selected from the group consisting of alkali metal carbonates, alkali metal bi-carbonates, and mixtures thereof.

---

2,771,344
**MANUFACTURE OF IRON OXIDE PIGMENT**
Laurent P. Michel, Watertown, and Thomas H. Goodgame, Ipswich, Mass., assignors to Godfrey L. Cabot, Inc., Boston, Mass., a corporation of Massachusetts
Application August 5, 1954, Serial No. 448,019
9 Claims. (Cl. 23—200)

1. A process for producing finely divided iron oxide which comprises reacting metallic iron with dilute hydrochloric acid thereby producing hydrogen gas and an aqueous solution of ferrous chloride, separating the ferrous chloride thus formed as a dry solid from said solution, contacting said ferrous chloride with chlorine gas at elevated temperatures in the absence of water vapor thereby producing ferric chloride in anhydrous vapor form, conducting said anhydrous ferric chloride vapor to a hydrolysis zone and therein intimately and turbulently con-

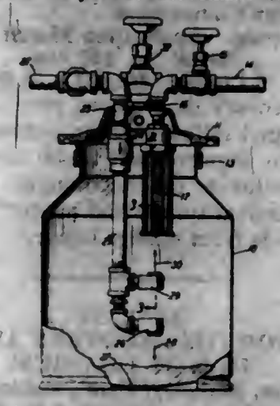


tacting said ferric chloride vapor with water vapor at elevated temperatures thereby hydrolyzing said ferric chloride to form an aerosol of solid iron oxide particles

in a gaseous medium containing by-product hydrogen chloride, and recovering directly from said aerosol a pigment grade iron oxide product having an average particle size of less than 100 millimicrons.

---

**2,771,345**
**PREPARATION OF TITANIUM DIOXIDE PIGMENTS**
**Charles A. Tanner, Jr., Moorestown, N. J., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine**
**Application June 1, 1951, Serial No. 229,482**
**7 Claims. (Cl. 23—202)**



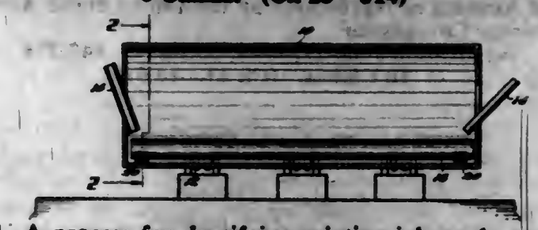
1. A method for the purification of a water-washed titania hydrolysate containing phosphatic impurities, which comprises (1) mixing an amount of an alkali metal hydroxide with an aqueous slurry of said hydrolysate sufficient to form water-soluble complexes of said impurities and adjust the pH of the slurry to at least 8.5 but insufficient to convert said hydrolysate to alkali metal titanate and digesting said mixture at a temperature between 50° C. and the boiling point thereof until solubilization of said impurities is substantially complete; (2) filtering and water-washing said alkali-treated hydrolysate thereby removing alkali-solubilized impurities including phosphatic impurities; (3) slurrying said hydrolysate with water and sufficient of a dilute mineral acid having an anion volatile at 850° C. to decrease the pH of the slurry to below 4; (4) digesting said slurry until the absorptive capacity of said hydrolysate for said acid is substantially satisfied; and (5) filtering and water-washing said acid-treated hydrolysate thereby removing acid-solubilized impurities.

---

**2,771,346**
**SOLUTION DISPENSER**
**Harry Lambers, Holland, Mich.**
**Application July 8, 1953, Serial No. 376,488**
**7 Claims. (Cl. 23—271)**

1. A solution dispenser, comprising: container means; removable cover means for said container; locking means for securing said cover means to said container; outlet conduit means secured to said cover means and communicating with the interior of said container; filter means connected to the inner end of said outlet conduit means and disposed within said container; inlet conduit means secured to said cover means and communicating with the interior of said container; first nozzle means connected to said inlet conduit means adjacent the inner end thereof and disposed to direct a jet at the bottom of said container; second nozzle means connected to said inlet conduit means adjacent the inner end thereof and

disposed to direct a jet to pass in close proximity to said filter means; one-way valve means disposed in said inlet conduit means to determine the direction of flow therein; by-pass conduit means connecting said inlet and outlet conduit means independently of the contents of said container; and control valve means in at least one of either said inlet or outlet conduit means, and also in said by-pass conduit means.



---

**ERRATUM**

For Class 23—283 see:
Patent No. 2,771,460

---

**2,771,347**
**DENSIFICATION OF INK GRADE CARBON BLACKS**
**Curt B. Beck, Pampa, Tex., and Charles A. Stokes, Wellesley Hills, Mass., assignors to Godfrey L. Cabot, Inc., Boston, Mass., a corporation of Massachusetts**
**Application January 25, 1954, Serial No. 405,969**
**6 Claims. (Cl. 23—314)**

1. A process for densifying printing ink grade carbon black without substantially impairing its dispersion qualities in ink vehicles which consists in moistening the black with 2–12% water by weight of the black and tumbling the black in a rotating drum while intermittently and rythmically pressing the mass of black along substantially its full length therein by rolling a continuous-walled cylindrical weight in an eccentric path across the surface of the black.

---

**2,771,348**
**STABILIZED CRACKED PETROLEUM FRACTIONS**
**Garbis H. Megnerian, Park Forest, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana**
**No Drawing. Application July 29, 1953, Serial No. 371,193**
**11 Claims. (Cl. 44—72)**

1. A stable cracked petroleum distillate, higher boiling than gasoline, which contains from about 0.0005 to about 0.5 percent by weight of an inhibitor selected from the

group consisting of (1) a mixture of a saturated organic amine and iodine, said mixture consisting of from about 5 to about 2000 parts by weight of amine and from about 1 to about 2000 parts by weight of iodine, said mixture affording at least about 0.0005 percent by weight of amine and at least about 0.001 percent by weight of iodine to said distillate, and (2) a saturated organic amine hydroiodide.

---

**2,771,349**
**STABILIZATION OF ORGANIC COMPOUNDS**
**Ralph B. Thompson, Hinsdale, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware**
**No Drawing. Application November 23, 1953, Serial No. 393,945**
**19 Claims. (Cl. 44—75)**

1. An organic material normally subject to oxidative deterioration containing from about 0.0001% to about 1% by weight of a 2,7-diamino-1,8-methylenedioxynaphthalene.

---

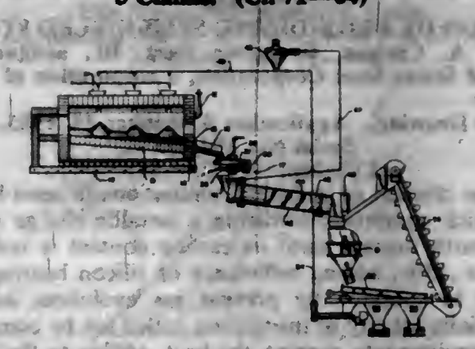
**2,771,350**
**EXPLOSIVE**
**Byron C. Baldridge, East Alton, Ill., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia**
**No Drawing. Application March 25, 1954, Serial No. 418,747**
**6 Claims. (Cl. 52—5.1)**

1. As an article of manufacture, an explosive charge of non-progressive burning single base smokeless powder composed essentially of particles of gelatinized nitrocellulose having a nitrogen content of at least 12.8 percent, said particles having a surface area within the range of from about 100 to about 200 square centimeters per gram thereof with each particle having dimensions that enable it to pass through a screen opening of 0.015 inch and remain on a screen having 0.0075 inch openings, and having a gravimetric density of at least about 0.800.

---

**2,771,351**
**PROPELLANT**
**Raymond S. Holmes, Hamden, Conn., and Byron C. Baldridge, East Alton, and John J. O'Neill, Jr., Alton, Ill., and Charles Earnest Silk, Stamford, Conn., assignors to Olin Mathieson Chemical Corporation, a corporation of Virginia**
**No Drawing. Application May 10, 1956, Serial No. 583,900**
**28 Claims. (Cl. 52—13)**

1. A propellant having improved ballistic characteristics composed essentially of substantially non-porous extruded nitrocellulose base propellent grains having a surface area of from about 10 square centimeters per gram to about 84 square centimeters per gram thereof, a web of from about 0.015 inch to about 0.07 inch, and having within the region of the grain which extends from each surface thereof not more than about one-sixth of the web of the propellent grain not less than about 3 percent of a deterrent having a heat of explosion constant of less than about —200 calories per gram.



---

**2,771,352**
**PROCESS OF PREPARING PROPELLANTS**
**John J. O'Neill, Jr., Roxana, Ill., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia**
**No Drawing. Application September 30, 1953, Serial No. 383,397**
**5 Claims. (Cl. 52—20)**

1. The process of reducing the gravimetric density of hardened symmetrical smokeless powder grains comprising suspending the grains in a two-phase liquid system, a non-solvent for smokeless powder base phase containing a protective colloid and a solvent for the smokeless powder base phase only partially miscible with the first said phase and having non-solvent dissolved therein, until said solvent with its non-solvent solute migrates into the grains and softens them throughout but, simultaneously, maintaining each of the grains in suspension in the non-solvent phase as a discrete body of substantially the same shape as the original grain as it is softened, removing the solvent from the resulting soft bodies thereby hardening them into smokeless powder grains of substantially the same shape and weight but of greater porosity than the original grains, and thereafter separating the hardened grains from the non-solvent phase.

---

**2,771,353**
**FUSED POTASH PRODUCT AND METHOD FOR FORMING SAME**
**Emory W. Douglass and Parker S. Dunn, Carlsbad, N. Mex., assignors to Potash Company of America, a corporation of Colorado**
**Application November 16, 1950, Serial No. 196,074**
**3 Claims. (Cl. 71—64)**

1. The process of decreasing the hygroscopicity of potash material comprising at least about 95% potassium chloride mixed with lesser quantities of impurities including sodium chloride or sulfates of potassium, which comprises the steps of fusing such a material and then cooling it to form a solidified material, said cooling including contacting a thin film of the molten material with a cool horizontal metal surface to lower the temperature throughout the material from about its melting point to about 500° C. in not more than about forty seconds and scraping the solidified material from the surface to form a flaked material characterized by the absence of observable crystal structure, low hygroscopicity and reduced caking tendency.

---

**2,771,354**
**CONCENTRATION OF IRON ORES**
**Olav Mokkebust, Hauge (Dalane), and Asmar Gjessing Oppegaard, Fredrikstad, Norway, assignors to National Lead Company, New York, N. Y., a corporation of New Jersey**
**No Drawing. Application June 1, 1953, Serial No. 358,982**
**1 Claim. (Cl. 75—33)**

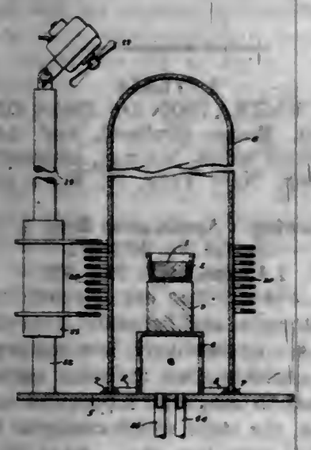
In a process wherein iron ore selected from the types consisting of taconite and hematite is partially reduced by heating at a comparatively low temperature in the presence of a carbonaceous reducing agent and subsequently subjected to magnetic separation to produce an iron concentrate, the steps which comprise crushing said ore to a particle size less than about 50 millimeters, screening said crushed ore to produce a plurality of fine and coarse fractions, removing from the finest fraction by means of a wet classification operation material of less than about 80 mesh particle size, and furnacing said fractions separately in the presence of a carbonaceous reducing agent at temperatures between 950° C. and 1100° C., employing lower temperatures in the lower part of this range for the finest fractions, the less than about 80 mesh material removed from the finest fraction

of crushed ore being dewatered, formed into discrete lumps, the lumps baked at a temperature between 900° C. and 1000° C., and the baked lumps being added to the iron concentrate obtained from treatment of the remaining ore fractions.

---

**2,771,355**
**AGGLOMERATING ORES IN THE BLAST FURNACE**
Harry Cohen, Chicago, Ill.
No Drawing. Application December 6, 1954, Serial No. 473,469
6 Claims. (Cl. 75—41)

1. The process of agglomerating iron ore inside the blast furnace which consists of adding to the iron ore being charged into the blast furnace a solution containing from one tenth to ten percent cementing agent and then charging the iron ore and cementing agent into the blast furnace.



---

**2,771,356**
**METHOD OF DEOXIDIZING SEMI-KILLED STEEL**
Willard A. Carlson, Evergreen Park, Ill., assignor to United States Steel Corporation, a corporation of New Jersey
No Drawing. Application September 25, 1953, Serial No. 382,463
2 Claims. (Cl. 75—58)

1. The method of reducing laminations in semi-killed steel which comprises, oxidizing a metallic charge in an open hearth furnace until its carbon content is reduced to .12 to .15%, adding sufficiency of silicon bearing deoxidizer to substantially prevent gas evolution, adding substantially totality of manganese called for by compositional requirements, tapping the heat, adding to the ladle 0.025% to 0.045% silicon in the form of silicon carbide, teeming the heat and treating the metal in the molds with not more than 0.07 pound of aluminum per ton of steel.

---

**2,771,357**
**METHOD OF MELTING METAL POWDER IN VACUO**
Donald Wroughton, Verona, N. J., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application July 27, 1944, Serial No. 546,913
10 Claims. (Cl. 75—84.1)

1. The method of refining uranium comprising the steps of melting a mass of impure uranium to concentrate nonvolatile impurities upon the surface of said uranium, allowing the mass to solidify with the impurities so concentrated, raising the temperature of the mass above the melting point of uranium, and straining the melted uranium, thereby separating solid impurities therefrom, while protecting said uranium from reactive gases.

**2,771,358**
**MACHINE ELEMENTS FOR CRUSHERS**
Warren McLellan Speer, Cranford, N. J., assignor to The International Nickel Company, Inc., New York, N. Y., a corporation of Delaware
Application July 16, 1954, Serial No. 443,905
6 Claims. (Cl. 75—128)

1. In a machine for crushing solid materials, a crushing element made of chilled martensitic cast iron of the definite chill type having a hard, wear-resistant outer portion and a tough, ductile inner portion containing spheroidal graphite, said cast iron containing about 3.5% to 3.8% carbon, about 0.9% to 1.1% silicon, about 4.5% to 4.8% nickel, about 0.5% to 0.7% chromium, about 0.2% to 0.6% manganese and a small amount up to about 0.09% magnesium effective to contorl the occurrence of graphite in said crushing element in a spheroidal form, and the balance essentially iron.

---

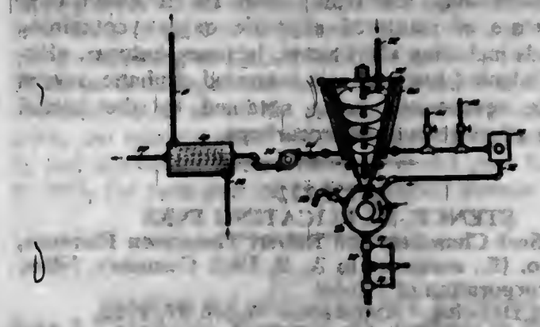
**2,771,359**
**RARE EARTH MASTER ALLOYS**
Simon J. Meraza, Reading, Pa., assignor to The Beryllium Corporation, Reading, Pa., a corporation of Delaware
No Drawing. Application March 24, 1955, Serial No. 496,595
1 Claim. (Cl. 75—170)

The method of preparing a master alloy suitable for subsequent alloying with other metal or metals, wherein the master alloy contains a rare earth, magnesium and nickel, which comprises melting approximately 500 parts by weight of magnesium and adding thereto approximately 2000 parts by weight of nickel, maintaining the nickel-magnesium alloy at a temperature in the range of approximately 1233° C. to 1343° C. while adding thereto approximately 1313 parts by weight of a rare earth fluoride.

---

**2,771,360**
**COBALT BASE ALLOY**
Vincent T. Malcolm, Indian Orchard, Mass., assignor to The Chapman Valve Manufacturing Company, Indian Orchard, Springfield, Mass., a corporation of Massachusetts
No Drawing. Application September 22, 1954, Serial No. 457,787
1 Claim. (Cl. 75—171)

A cobalt base alloy having excellent stress rupture characteristics at a temperature of 1500° F., said alloy consisting essentially as follows: 0.20–0.50% by weight of carbon, 0.40–1.00% by weight of manganese, 0.20–0.40% by weight of silicon, 25.00–35.00% by weight of chromium, a maximum of 4.00% by weight of nickel, 4.00–6.00% by weight of molybdenum, a maximum of 2.00% by weight of iron, 2.00–4.00% by weight of tantalum, and a balance of cobalt.



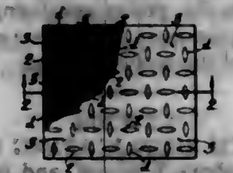
---

**2,771,361**
**DEFIBRATION PROCESSES**
Clarence Birdseye, Gloucester, and Harold D. Stuck, Andover, Mass., assignors, by mesne assignments, to Process Evaluation and Development Corporation, New York, N. Y., a corporation of Delaware
Application December 7, 1951, Serial No. 260,352
3 Claims. (Cl. 92—1)

1. In a continuous defibrating process, the steps of freeing a mass of digested vegetable fibre by compression from excess digestant solution and introducing the mass

as press cake into a confined space containing hot water, breaking up the press cake by stirring and meanwhile

subjecting the aqueous mixture to superatmospheric pressure.



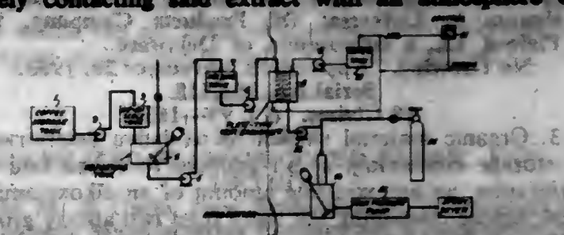
---

**2,771,362**
**CELLULOSE FIBROUS PRODUCTS CONTAINING POLYMERS OF VINYLOXYETHYLUREA AND METHOD OF PRODUCING THEM**
Vincent J. Moser, Oreland, and Sidney Melamed, Philadelphia, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware
No Drawing. Application February 9, 1954, Serial No. 409,255
11 Claims. (Cl. 92—3)

1. As a new article of manufacture, a fibrous product comprising cellulosic fibers and having incorporated in the body thereof an initially water-soluble polymer selected from the class consisting of homopolymers of vinyloxyethylurea and copolymers of vinyloxyethylurea with 4-vinyl pyridine.

---

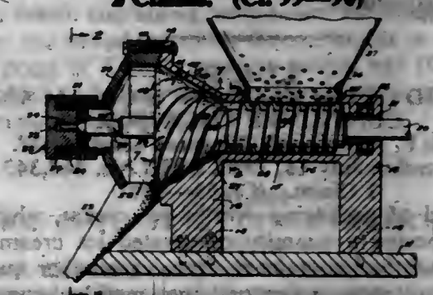
**2,771,363**
**PAPER WEB WITH A SIMULATED WOVEN TEXTURE**
James Fish, Erving, Mass., assignor to The Paterson Parchment Paper Company, Bristol, Pa., a corporation of Pennsylvania
Application March 3, 1949, Serial No. 79,457
5 Claims. (Cl. 92—3)



1. As a new article of manufacture, a paper web wherein the interfelted relation of the component fibers is continuous throughout said web being of basis weight materially exceeding that of tissue and having a substantially uniform pattern of small areas of tissue-like thinness, said areas constituting collectively a minor part of the total area of that portion of the web in which they occur and each being entirely surrounded by an area of greater thickness, and the said thicker areas being interconnected and constituting the continuous strength conferring portion of the web.

---

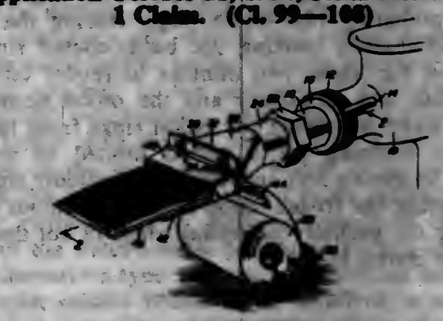
**2,771,364**
**CARBONATION OF COFFEE EXTRACT**
Fletcher A. Chase, Morris Plains, and George E. Lauraon, West Orange, N. J., assignors to American House Products Corporation, New York, N. Y., a corporation of Delaware
Application June 11, 1954, Serial No. 436,124
2 Claims. (Cl. 99—71)



1. In a process of producing soluble solid coffee extract in which a highly concentrated aqueous coffee extract containing up to 58 percent soluble coffee solids is spray dried, the improvement which comprises absorbing carbon dioxide to saturation in said aqueous extract by intimately contacting said extract with an atmosphere of

carbon dioxide at an elevated temperature below the boiling point of the extract and at superatmospheric pressure in the range 15–150 lb. p. s. i. g., and then feeding the extract at a much higher pressure to a spray drier.

---



**2,771,365**
**METHOD OF MAKING BREAD FROM GRAIN KERNELS**
Nathan D. Mininberg, Stamford, Conn., assignor to Ella Mininberg, Stamford, Conn.
Application March 23, 1951, Serial No. 217,094
2 Claims. (Cl. 99—90)

1. A method of making bread from grain kernels, comprising selecting sliced and flattened kernel segments in which each of the latter is composed of several of the various portions of the grain kernels so that said segments will not be characterized by the physical characteristics of any single kernel portion, adding yeast to said segments in the ratio of approximately 6 parts of yeast to 100 parts of segments by weight, adding water to the yeast and segments and mixing them to form a dough, and then initiating a baking operation before substantial fermentation of the yeast in said dough commences.

---

**2,771,366**
**METHOD OF PREPARING A MEAT PRODUCT**
Hollum B. Shadid, Oklahoma City, Okla.
Application October 11, 1954, Serial No. 461,398
1 Claim. (Cl. 99—108)

The method of preparing a cohesive strip of ground meat product from lean beef and connective tissues, said method including the steps of grinding lean beef and connective tissues, chilling the ground meat product until the ground connective tissues turn gelatinous, regrinding the chilled meat product, compressing the meat product while providing said ground meat product with longitudinal serrations so as to interweave the fibers of the ground meat thereby forming a cohesive ground meat product.

2,771,367
STABILIZATION OF ORGANIC COMPOUNDS
Ralph B. Thompson and Tol Symon, Hinsdale, Ill., assignors to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
No Drawing. Application November 20, 1953, Serial No. 393,518
18 Claims. (Cl. 99—163)

3. Organic material subject to oxidative deterioration in storage containing, as an additive to retard said deterioration, an antioxidizing amount of an alkoxy-aminonaphthalene containing not more than two alkoxy groups and not more than two amino groups.

2,771,368
STABILIZATION OF ORGANIC COMPOUNDS
Ralph B. Thompson, Hinsdale, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
No Drawing. Application November 20, 1953, Serial No. 393,517
17 Claims. (Cl. 99—163)

1. An organic material normally subject to oxidative deterioration containing an antioxidizing amount of a 3,4,5-trialkoxyaniline.

2,771,369
METHOD OF PACKAGING ICE CREAM AND CONTAINER THEREFOR
Merle F. Allerheugh, Newport Beach, Calif.
Application July 16, 1953, Serial No. 368,343
1 Claim. (Cl. 99—180)

A method of packaging aerated ice cream, which includes: disposing a quantity of aerated ice cream in a first open-mouthed container; disposing another quantity of aerated ice cream in a second open-mouthed container, with said ice cream in said first and second containers abutting against one another in a common contacting face and said containers cooperating to form a unified confined space of normally fixed volume; and said first and second containers when moved inwardly relative to one another, reducing the volume of said confined space to increase the density of said aerated ice cream as a portion of the air is expelled therefrom.

2,771,370
FRENCH FRIED ONION RINGS AND THE METHOD OF MAKING SAME
Clyde H. Allen, Albion, Mich.
No Drawing. Application September 30, 1954, Serial No. 459,511
4 Claims. (Cl. 99—193)

1. The method of preparing fried onion rings, which comprises preparing raw onion rings, coating the rings with a thick batter, cooking the batter-coated rings in hot deep fat for about two minutes to render only the batter cooked and non-sticky and the onion rings only partially cooked, removing the onion rings from the hot fat, quickly draining for a period limited to prevent same from becoming soft and sticky, and rapidly freezing same, removing the frozen onion rings and without thawing cooking the partially precooked rings in hot deep fat until golden brown in color.

2,771,371
ANTI-RUST OILS
Edgar A. Dieman, Crown Point, and Philip H. Ravenscroft, Munster, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
No Drawing. Application September 23, 1952, Serial No. 311,142
6 Claims. (Cl. 106—14)

4. A composition for preventing rust formation on ferrous metal surfaces which are normally exposed to atmospheric air and moisture, which composition consists essentially of a phenol extract of a petroleum oil of lubricating oil viscosity, from about 1% to about 30% of mahogany soap, and from about 1% to about 10% of a mixture of saturated aliphatic oxygen containing compounds including alkyl esters, lactones, ketones, alcohols, and alcohol ketones, said saturated aliphatic oxygen containing compounds being obtained by the partial oxidation of petroleum hydrocarbons.

2,771,372
STENCIL DUPLICATING INKS
Thomas Seal Chambers and Robert Thompson Florence, Chicago, Ill., assignors to A. B. Dick Company, Niles, Ill., a corporation of Illinois
No Drawing. Application March 27, 1952, Serial No. 278,948
3 Claims. (Cl. 106—22)

1. A stencil duplicating ink consisting essentially of water as diluent, a tinctorial agent present in sufficient quantity to impart legibility to the copy, a water soluble alkylene glycol polymer present in an amount within the range of 30–60 percent by weight having a molecular weight greater than 1000 selected from the group consisting of a polyethylene glycol and a polypropylene glycol for bodying the ink composition and to provide an adherent base upon drying, and a liquid polyhydric alcohol present in an amount up to 40 percent by weight.

2,771,373
STENCIL DUPLICATING INKS
Thomas Seal Chambers, Chicago, and Robert Thompson Florence, Park Ridge, Ill., assignors to A. B. Dick Company, Niles, Ill., a corporation of Illinois
No Drawing. Application March 27, 1952, Serial No. 278,947
4 Claims. (Cl. 106—24)

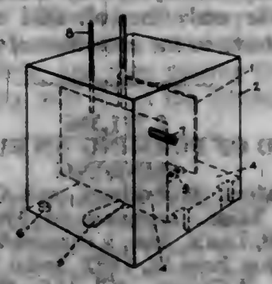
1. A stencil duplicating ink consisting essentially of more than 50 percent by weight of water as the principal diluent, from 3–15 percent by weight of a tinctorial agent, from 3–15 percent by weight of a protein dissolved in the aqueous medium to body the ink composition and to provide an adherent base upon drying, a liquid polyhydric alcohol present in an amount up to 40 percent by weight, 0.2–2 percent by weight of a wetting agent, and an aldehyde selected from the group consisting of glyoxal and pyruvic aldehyde present in amounts ranging from 5–20 percent by weight of the bodying agent.

2,771,374
STENCIL DUPLICATING INKS
Thomas Seal Chambers, Chicago, and Robert Thompson Florence, Park Ridge, Ill., assignors to A. B. Dick Company, Niles, Ill., a corporation of Illinois
No Drawing. Application March 27, 1952, Serial No. 278,946
6 Claims. (Cl. 106—25)

1. A stencil duplicating ink consisting essentially of more than 50 percent by weight water as the principal diluent, from 3–15 percent by weight of a tinctorial agent, from 0.5–30 percent by weight of a polysaccharide dissolved in the aqueous medium to body the ink composition and to provide an adherent base upon drying, and a liquid polyhydric alcohol present in an amount up to 40 percent by weight of the ink composition.

2,771,375
GLASS-LIKE COMPOSITION AND METHOD FOR MAKING THE SAME
Robert W. Forsher, Metuchen, N. J., assignor to National Lead Company, New York, N. Y., a corporation of New Jersey
No Drawing. Application August 26, 1952, Serial No. 306,498
3 Claims. (Cl. 106—49)

1. In a $TiO_2$ opacified vitreous enamel composition prepared by maturing a mixture of a frit composition and $TiO_2$ as an opacifying agent, said frit composition containing from 45 to 65 percent $PbO$, from 20 to 40 percent $SiO_2$, from 0 to 8 percent alkali selected from the group consisting of $Li_2O$, $Na_2O$, $K_2O$ and mixtures thereof, from 0 to 8 percent $B_2O_3$, and from 0 to 9 percent dissolved $TiO_2$, all of the percentages being weight percents, the improvement which consists in having present in said frit composition from 0.01 to 0.1 part by weight of $P_2O_5$ for each part of $PbO$ contained therein.



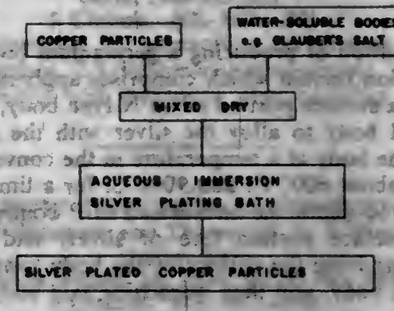
2,771,376
LINING OF REFRACTORY VESSELS
John J. Capellman, Tarentum, Pa., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania
No Drawing. Application May 8, 1952, Serial No. 286,985
6 Claims. (Cl. 106—57)

1. A lining paste for lining glass tank bottom refractory blocks which consists of water and a mixture of zirconium silicate and sodium silicate, said zirconium silicate having a maximum particle size of about 100 mesh and constituting 90 to 99% by weight of the mixture of zirconium silicate and sodium silicate, said paste having a dry press consistency.

2,771,377
THERMOPLASTIC COMPOSITIONS OF WATER-SOLUBLE CELLULOSE ETHERS
George K. Greminger, Jr., Midland, and Miles A. Weaver, Ithaca, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Application November 25, 1953, Serial No. 394,478
7 Claims. (Cl. 106—186)

1. A thermoplastic composition consisting of from 5 to 80 percent of a water-soluble cellulose ether selected from the group of alkyl cellulose, hydroxyalkyl cellulose, and alkyl hydroxyalkyl cellulose in which the alkyl group contains from 1 to 3 carbon atoms and the hydroxyalkyl group contains from 2 to 3 carbon atoms, and correspondingly from 95 to 20 percent of an amine selected from the group consisting of monoethanolamine, monoisopropanolamine, and triethylene tetramine.

2,771,378
METHOD OF PRODUCING MAR RESISTANT SURFACES ON THERMOPLASTIC MATERIALS
Theodore J. Motter, Lemoyne, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application April 17, 1952, Serial No. 282,789
8 Claims. (Cl. 117—47)



1. The method of applying a mar resistant surface to a thermoplastic material formed of polymethylmethacrylate which comprises exposing the surface of polymethylmethacrylate to vapors of a suitable volatile organic solvent which will not craze said surface and subsequently to vapors of the solvent and silicon tetrachloride.

2,771,379
STABILIZED-FLAMEPROOFED FABRIC AND METHOD
Mario M. di Dario, New Brunswick, N. J., assignor to Chicopee Manufacturing Corporation, a corporation of Massachusetts
Application December 30, 1952, Serial No. 328,554
10 Claims. (Cl. 117—76)

1. A fabric containing ammonium sulfamate as flame retarder and mixed therewith dicyandiamide in an amount in the range of 5 to 50 parts by weight per 100 parts of ammonium sulfamate sufficient to stabilize substantially said ammonium sulfamate.

2,771,380
METHOD OF PLATING COPPER PARTICLES WITH SILVER
Joseph J. Coleman and Emil M. Dittman, Freeport, Ill., assignors to Burgess Battery Company, Freeport, Ill., a corporation of Delaware
Application August 2, 1954, Serial No. 447,409
8 Claims. (Cl. 117—227)

1. The method of plating copper particles with silver which comprises dry mixing said copper particles with discrete water-soluble bodies whereby said copper particles become attached to the surfaces of said water-soluble bodies, said water-soluble bodies being of a size substantially larger than that of said copper particles and the volume of the water-soluble bodies being greater than that of the copper particles and being sufficient that the copper particles are in dispersed condition on the surfaces of the water-soluble bodies, immersing said mixture in an immersion type aqueous silver plating bath, causing said water-soluble bodies to be dissolved in said plating bath, and separating the resulting silver plated copper particles from said plating bath.

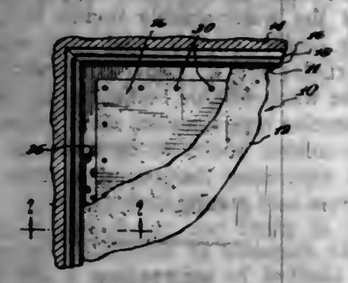
2,771,381
DRY CELL
Clarence K. Morehouse, Princeton, N. J., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application September 30, 1953, Serial No. 383,391
2 Claims. (Cl. 136—138)

1. In the manufacture of a depolarizer mix for dry

cells, the improvement which comprises intermixing with

said depolarizer a cation exchange resin in its acid condition.

---



2,771,382
METHOD OF FABRICATING SEMICONDUCTORS FOR SIGNAL TRANSLATING DEVICES
Calvin S. Fuller, Chatham, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 12, 1951, Serial No. 261,277
1 Claim. (Cl. 148—1.5)

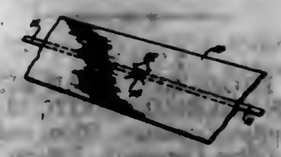
The method of producing a germanium body having a PN junction therein which comprises applying a layer of silver to a surface portion of an N-type body, heating the layer and body to alloy the silver with the germanium, heating the body at a temperature in the conversion range between about 600° C. and 900° C. for a time to control to a desired depth the conversion to P conductivity type of the surface portion free of silver, said conversion progressing from the surface of the body toward the center of the body, and then quenching said body.

---

2,771,383
COMBINATION FLOOR COVERING
Robert Fine, Chicago, Ill.
Application January 26, 1954, Serial No. 406,190
4 Claims. (Cl. 154—49)

4. In a readily removable floor covering, comprising a light-weight unstiffened carpet and a sponge rubber pad, said carpet overlaying said pad; a plurality of multi-membered fastening devices mounted in intermittent spaced relationship one with the other along the marginal edges of the carpet and pad, said fastening devices adapted to join said carpet and pad in cooperating relationship whereby the pad imparts stiffness to the carpet, each of said fastening devices comprising a grommet affixed in the marginal edges of the carpet, an apertured disc affixed in the marginal edge of the pad, and a tie string joining the grommet and disc together in operational relationship.

---



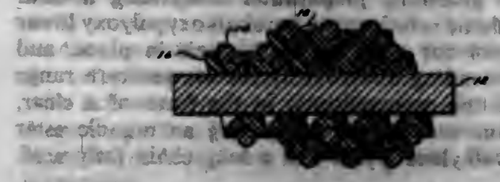
2,771,384
PROTECTIVE MATERIAL
William J. Collins, Newton, Mass., assignor to Victory Plastics Co., Hudson, Mass., a corporation of Massachusetts
Application January 31, 1955, Serial No. 484,947
3 Claims. (Cl. 154—52.5)

1. A protective structure comprising a multiplicity of layers of fabric bonded together along straight and parallel lines in staggered relation with a given intermediate layer being bonded to the layer next above it along lines substantially midway between the lines along which the said intermediate layer is bonded to the layer next below, thereby forming pockets between the said layers disposed in staggered relation, the said bond lines being substantially narrower than the distance between the same on each side of each layer whereby said pockets substantially overlap, and overlapping inserts of hard sheet material located in the outer series only of said pockets and cushioned by the inner layers of the structure.

---

2,771,385
PRESSURE-SENSITIVE AND REMOISTENING DRAW TAPE
Ferdinand W. Humphner, River Forest, Ill., assignor to Mid-States Gummed Paper Co., Chicago, Ill., a corporation of Delaware
Application August 26, 1954, Serial No. 452,251
15 Claims. (Cl. 154—53.5)

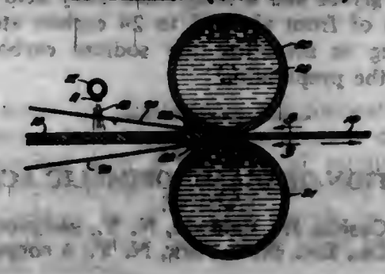
1. Tear tape, comprising a tape body formed of rupturable material, adhesive on the underside of said tape, and a tear-filament extending longitudinally of the underside of said tape and united thereto, said filament being slit from side to side along a line of severance extending through said tape and part way thereacross at a point intermediate the ends thereof, said tape and filament being non-adhesive in the area thereof at said slit.



---

2,771,386
METHOD OF FORMING AN ELECTRICAL WINDING
Edmund H. Merz, Wilbraham, and George E. Urban, Springfield, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
Application June 14, 1952, Serial No. 293,552
3 Claims. (Cl. 154—80)

1. A method for preparing an electrical winding including a core and an electrically conductive winding having a partially insulated and a partially exposed electrical conductor, which comprises the steps of completely surrounding the electrical conductor with an insulating

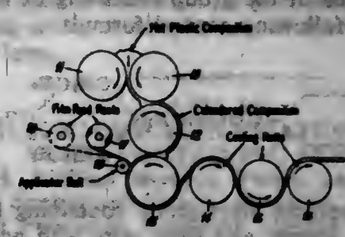


plastic composition of from about 10% to 30% by weight of a copolymer of a monovinylidene aromatic hydrocarbon with a conjugated diene and from 70% to 90% by weight of a polymerized monovinylidene hydrocarbon, hardening said composition, then winding the thus coated electrical conductor about a core, splitting the insulation surrounding the electrical conductor into a

radially outer half and a radially inner half as said conductor is initially bent around said core, and removing the radially outer half of said insulation from the wound core, said monovinylidene hydrocarbon being taken from the group consisting of styrene, side-chain substituted alkyl styrene, and ring-substituted alkyl and chlorostyrene.

---

2,771,387
BITUMINOUS TREATED GLASS FIBER STRUCTURES AND METHODS OF PRODUCING THEM
Dale Kiefer, William K. Sidwell, and Ralph J. Reed, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, Toledo, Ohio, a corporation of Delaware
Application November 21, 1951, Serial No. 257,662
13 Claims. (Cl. 154—93)



1. A composition of matter comprising a porous fabric of glass wool fibers, a bituminous compound impregnating the fabric and coating the surfaces thereof, and a plurality of glass fiber strands in closely spaced apart relation embedded within the coating of the bituminous compound.

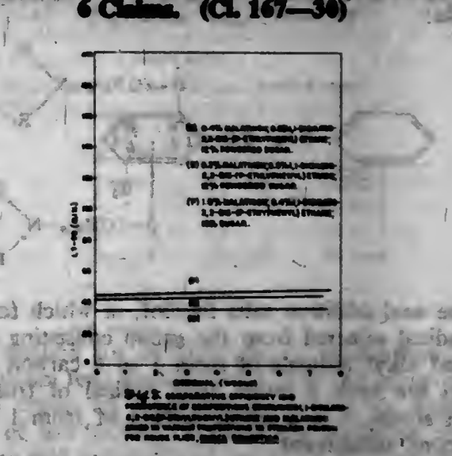
4. The method of manufacturing a glass fiber fabric impregnated with bituminous material comprising the steps of heating a bituminous composition ordinarily solid at room temperature to fluid condition, applying the hot melt of bituminous material to a porous fabric of glass wool fibers in sufficient quantity to fill the pores of the fabric and provide a generous coating, passing the fabric with the bitumen through squeeze rolls while the bituminous composition is still in flowable form whereby puddles of bituminous material are formed at the nip, feeding a plurality of strands of continuous fibers in closely spaced apart parallel relation through the puddles and then between the squeeze rollers whereby they are fully wetted by the bituminous composition and embedded within the coating of the fabric, and then passing the impregnated mass about cooling rolls to set the bituminous material.

---

2,771,388
METHOD OF LAMINATING LAYERS OF THERMOPLASTIC FOIL
Joseph F. Rocky, Union, and Frank E. Nicol, Plainfield, N. J., assignors to Union Carbide and Carbon Corporation, a corporation of New York
Application June 18, 1953, Serial No. 362,549
3 Claims. (Cl. 154—102)

1. A method for continuously preparing a homogeneous sheet comprising laminated thermoplastic foils which comprises charging a heated thermoplastic composition to the bight between two heated rolls of a calender, calendering said thermoplastic composition to a thermoplastic foil, said foil being in a heated tacky condition and adhering directly to the surface of the last heated calender roll after passage through a bight formed in part by said last calender roll, applying a previously prepared thermoplastic foil against said heated tacky thermoplastic foil after said heated tacky thermoplastic foil has passed through said bight formed in part by said

last heated calender roll and while said heated tacky thermoplastic foil remains adhered directly to and travels with the surface of said last heated calender roll, said previously prepared thermoplastic foil becoming fused to said heated tacky thermoplastic foil to form a homogeneous sheet while said heated tacky thermoplastic foil remains adhered directly to and travels with the last heated calender roll and thereafter removing said formed homogeneous sheet of fused thermoplastic foils from said last heated calender roll.



---

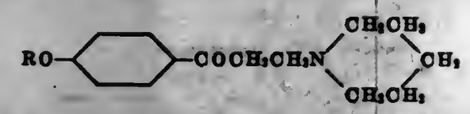
2,771,389
COMPOSITION FOR CONTROLLING GROWTH OF FUNGI COMPRISING DICHLORONAPHTHAQUINONE AND BENTONITE SULFUR
Harry W. Dye, Medina, N. Y., assignor to Food Machinery and Chemical Corporation, San Jose, Calif.
No Drawing. Application July 31, 1951, Serial No. 239,633
5 Claims. (Cl. 167—20)

1. A composition for controlling the growth of fungi which comprises 2,3-dichloronaphthaquinone in minor amount blended with bentonite clay carrying colloidal sulfur.

---

2,771,390
SYNERGISTIC INSECTICIDAL COMPOSITIONS
Byron Williamson and Thurmond A. Williamson, Dallas, Tex.
Application August 12, 1954, Serial No. 449,342
6 Claims. (Cl. 167—30)

4. A stomach poison for insects including 1,1-dichloro-2,2-bis(p-ethylphenyl)ethane, a residual type bait, and another substance selected from the group consisting of O,O-dimethyl dithiophosphate of diethyl mercaptosuccinate and O,O-diethyl-O-[2-isopropyl-4-methyl pyrimidyl (6)] thiophosphate.



2,771,391

## PHYSIOLOGICALLY ACTIVE p-ALKOXY-BETA-PIPERIDINOPROPIOPHENONES CAUSING CNS DEPRESSANT AND ANESTHETIC EFFECTS IN ANIMALS

Earl R. Bockstahler, Indianapolis, Ind., assignor to Allied Laboratories, Inc., Kansas City, Mo., a corporation of Delaware

No Drawing. Application August 28, 1953, Serial No. 375,548
8 Claims. (Cl. 167—53)

1. A compound of the group consisting of those represented by the following general formula:

where R represents an alkyl group containing from two to eight carbon atoms, and their salts with acids being substantially free from impurities and being characterized in that they possess the physiological ability to exert a local anesthetic effect, an epidural anesthetic effect in domestic animals and the ability to control the canine tremor-rigidity syndrome.

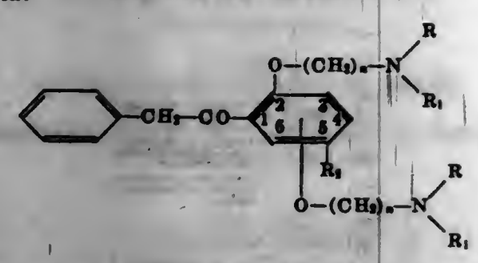
2,771,392

## CARBOMYCIN COMPLEXES

Fred W. Tanner, Jr., and Thomas M. Lees, Baldwin, N. Y., and John B. Routien, Tenafly, N. J., assignors to Chas. Pfizer & Co., Inc., New York, N. Y., a corporation of Delaware

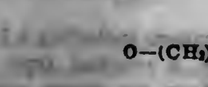
No Drawing. Application April 6, 1953, Serial No. 347,152
6 Claims. (Cl. 167—65)

1. A complex of a carbomycin antibiotic selected from the class consisting of carbomycin A and carbomycin B with a compound selected from the class consisting of a liquid aromatic hydrocarbon and chlorobenzene.



2,771,393

## NEW DERIVATIVES OF DESOXYBENZOINS AND THE PROCESS OF PREPARING THEM



David Libermann and Maurice Moyeux, Paris, France, assignors to Chimie et Atomistique, Paris, France, a French body corporate

Application July 27, 1953, Serial No. 370,518
12 Claims. (Cl. 167—65)

1. New derivatives of desoxybenzoins selected from the group consisting of the compounds having the general formula:

and the acid addition salts thereof, in which formula $R_2$ is a radical selected from the group consisting of hydrogen and alkyl radicals of from 1 to 6 carbon atoms, R and $R_1$ are each a lower alkyl radical of from 1 to 4 carbon atoms, $n$ is a whole integer of from 1 to 3, and the second substituent

is in a position selected from the positions consisting of 4 and 6.

2,771,394

## HAIR GROOMING PREPARATION

Robert James Mahaffey, River Edge, N. J., assignor to Colgate-Palmolive Company, a corporation of Delaware

No Drawing. Application July 10, 1953, Serial No. 367,345
8 Claims. (Cl. 167—87)

1. A hair grooming preparation comprising a clear aqueous-alcoholic solution of a lower alkoxypolyoxy lower alkylene glycol for maintaining the hair in place, and means for extending downwardly the temperature range within which the preparation is in the form of a clear, stable solution, said means comprising an organic ester of a polyoxyalkylene glycol and a long chain fatty acid.

2,771,395

## AQUEOUS ALCOHOLIC HAIR GROOMING PREPARATION EMPLOYING SODIUM CARBOXYMETHYL CELLULOSE

Robert James Mahaffey, River Edge, N. J., assignor to Colgate-Palmolive Company, a corporation of Delaware

No Drawing. Application June 29, 1953, Serial No. 364,918
6 Claims. (Cl. 167—87)

1. A clear liquid hair grooming preparation comprising an aqueous alcohol mixture of sodium carboxymethyl cellulose, an ester formed from a polyoxyalkylene glycol and a long chain fatty acid having a chain length of from about 8 to 24 carbon atoms, and an ester formed from an alkylene glycol and a long chain fatty acid having a chain length of from about 8 to 24 carbon atoms, said esters serving to solubilize the sodium carboxymethyl cellulose in the preparation.

2,771,396

## PREPARATION OF DIAMINOPIMELIC ACID AND LYSINE

Lester Earl Cascio, Jr., Baldwin, N. Y., assignor to Chas. Pfizer & Co., Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application December 9, 1955, Serial No. 551,987
11 Claims. (Cl. 195—30)

1. A process for the preparation of lysine which comprises the steps: (*a*) fermenting on a nutrient medium comprising glycerol and cornsteep liquor under submerged, aerobic conditions with a mutant of *E. coli* which requires lysine for its growth and lacks the enzyme diaminopimelic acid decarboxylase, while maintaining the pH of the medium near neutrality, and (*b*) treating diaminopimelic acid with the enzymes produced by an organism selected from the group consisting of *A. aerogenes*, and those strains of *E. coli* which do not require lysine for their growth.

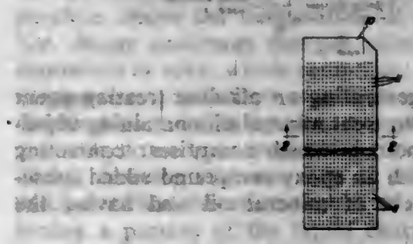
2,771,397

## ANTIBIOTIC AND METHOD FOR PRODUCING IT BY BACILLUS POLYMYXA

Robert G. Benedict and Frank H. Stodola, Peoria, Ill., assignors to the United States of America as represented by the Secretary of Agriculture

No Drawing. Application March 3, 1950, Serial No. 147,576
4 Claims. (Cl. 195—96)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A process of producing polymyxin comprising cultivating *Bacillus polymyxa* in an aqueous medium comprising a proteinaceous material and in the presence of not more than 4 percent of an assimilable carbon source, continuing said cultivation until substantially maximum yield of polymyxin is produced in the medium, substantially immediately thereafter separating the cells from the liquor and isolating the antibiotic from the cell-free liquor, said separation and isolation being carried out after not more than five days of fermentation.



2. A process of producing polymyxin D comprising cultivating *Bacillus polymyxa* NRRL B-698 in an aqueous medium comprising a proteinaceous material and in the presence of not more than 4 percent of an assimilable carbon source, continuing said cultivation until substantially maximum yield of polymyxin is produced in the medium, substantially immediately thereafter separating the cells from the liquor, contacting the cell-free liquor with active carbon and removing the adsorbed antibiotic from the carbon by elution, said separation and isolation being carried out after not more than five days of fermentation.

2,771,398

## METHOD AND APPARATUS FOR COUNTING MICROORGANISMS

Thomas L. Sayder, Frederick, Md., assignor to the United States of America as represented by the Secretary of the Army

Application September 17, 1953, Serial No. 380,888
2 Claims. (Cl. 195—103.5)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A device for determining the concentration of microorganisms in a liquid which consists of a slab-like form provided with a plurality of relatively uniform openings therethrough; said openings being of a capillary size for holding liquid samples therein by capillary attraction; said slab-like form being made of polymerized tetra-fluoro ethylene.

2,771,399

## PROCESS AND APPARATUS FOR DETERMINING BIOLOGICAL POTENCY OF A SUBSTANCE IN A LIQUID SUBSTRATE

George M. Savage, Kalamazoo, Mich., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

Application October 12, 1954, Serial No. 461,864
27 Claims. (Cl. 195—103.5)

1. A process for determining the growth-affecting potency of a plurality of liquid media with respect to a selected test organism comprising the steps: arranging said liquid media in a plurality of separate containers, simultaneously transferring equal quantities of liquid media from said plurality of containers to a transfer media and then depositing same from said transfer media in a predetermined pattern on a solid substrate seeded with said test organism and then subjecting said solid substrate to conditions favorable to the growth of said test organism.

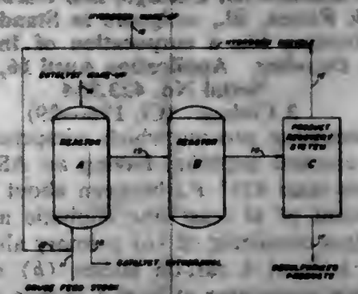
21. In a device for inverting a plurality of liquid carrying containers simultaneously onto an absorbent sheet, the combination comprising: a base member; a horizontal shaft extending from said base member; a backboard supported on said shaft and rotatably related to said base member; a bottom platform extending from said backboard at the lower end thereof and a pair of upright positioning pins extending upwardly from each end respectively of said bottom platform; a tray for holding said containers on said platform; a member extending from said backboard in the same direction as said platform and spaced therefrom, a pressure plate and means supporting said pressure plate at adjustable distances from said platform.

2,771,400

## CATALYTIC DESULPHURISATION OF MOTOR FUELS CONTAINING BENZOLE

Frederick William Bertram Porter and John Welford Hyde, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited

No Drawing. Application May 27, 1953, Serial No. 357,882
Claims priority, application Great Britain June 5, 1952
2 Claims. (Cl. 196—28)



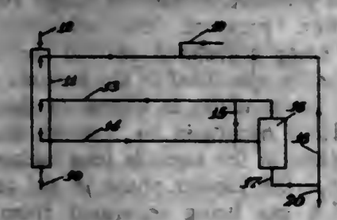
1. A process for the catalytic desulphurisation of benzole which comprises passing the benzole in vapour form at a space velocity of 0.5–3.0 v./v/.hr. and in admixture with hydrogen over a sulphur-resistant dehydrogenation-hydrogenation catalyst consisting of the oxides of cobalt and molybdenum supported on alumina at a selected temperature within the range 750–800° F. and a selected pressure within the range 100 p. s. i. ga. and equilibrium pressure, the selected temperature and pressure being correlated so that the dehydrogenation of naphthenes contained in the benzole is effected to an extent not substantially in excess of that required to produce sufficient hydrogen to convert the organically combined sulphur in the benzole into hydrogen sulphide and to maintain the vapour phase in the reaction zone, a hydrogen-rich gas being separated from the treated benzole and recycled to the reaction zone at the rate of 2000–10,000 S. C. F./B. to constitute the whole of the hydrogen supplied to said zone.

2,771,401

## DESULFURIZATION OF CRUDE OIL AND CRUDE OIL FRACTIONS

George R. L. Shepherd, Baytown, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

Application August 5, 1954, Serial No. 447,993
2 Claims. (Cl. 196—28)



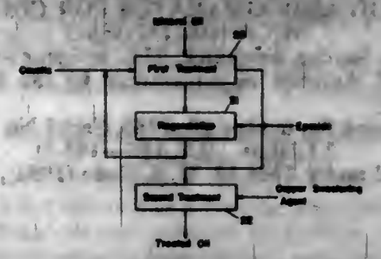
2. A method for desulfurizing a naphthenes-containing petroleum feed stock selected from the group of crude oils and crude oil fractions containing an appreciable amount of ash-forming constituents including the steps of heating said selected feed stock to a temperature within the range of 700° to 850° F. whereby at least a substantial portion of said feed stock is vaporized, contacting said heated feed stock at a temperature within said range in a first catalytic zone with a spent silica-alumina cracking catalyst in the presence of hydrogen in an amount of 2 to 40 moles per mol of oil, a pressure in the range of 0 to 500 pounds per square inch gauge and a feed rate

within the range of 0.5 to 20 volumes of liquid feed per volume of said spent catalyst per hour, removing the effluent from said catalytic zone and contacting it in a second catalytic zone with a gamma alumina-supported sulf-active hydrogenation catalyst at a temperature within the range of 700 to 850° F., a hydrogen ratio of 2 to 20 moles per mol of oil, a pressure within the range of 0 to 500 pounds per square inch gauge and a feed rate in the range of 0.2 to 10.0 volumes of liquid feed per volume of catalyst per hour, removing effluent from said second catalytic zone and recovering a desulfurized oil product, said sulf-active hydrogenation catalyst being selected from the class consisting of oxides and sulfides of V, Cr, Mn, Fe, Co, Ni, Mo and W, said first catalytic zone being maintained at a temperature within the range of 30° to 60° greater than the temperature of the second catalytic zone whereby at least a portion of said naphthenes are dehydrogenated, whereby hydrodesulfurization is maximized and whereby hydrocracking is minimized.

---

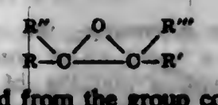
**2,771,402**
**HYPOCHLORITE PROCESS FOR THE TREATMENT OF PETROLEUM DISTILLATES**
Stanley Francis Birch, Thomas Vernon Cullum, and Ronald Alfred Dean, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited
Application May 13, 1953, Serial No. 354,686
Claims priority, application Great Britain May 14, 1952
6 Claims. (Cl. 196—29)

1. A process for the treatment of a petroleum distillate boiling up to the end of the gas oil range, comprising treating the distillate with a hypochlorite solution, contacting the treated distillate countercurrently with a mixture consisting essentially of methanol and a caustic alkali solution, said caustic alkali solution having a strength of between 0.5% and 50% w./w., and then treating the distillate with caustic alkali solution alone.



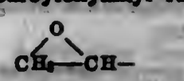
---

**2,771,403**
**AIR-CAUSTIC SWEETENING**
Mathew L. Kalinowski, Chicago, and Garbis H. Megerian, Park Forest, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
No Drawing. Application April 16, 1954, Serial No. 423,834
3 Claims. (Cl. 196—29)



1. A sweetening process which comprises (1) adding to a sour cracked naphtha, having an ASTM endpoint of not more than 425° F., between about 0.001 and 10 weight percent of at least one aliphatic amine selected from the class consisting of (*a*) primary aliphatic amines containing at least 8 carbon atoms, (*b*) secondary aliphatic amines containing at least 5 carbon atoms in each aliphatic group, and (*c*) tertiary aliphatic amines containing at least 3 carbon atoms in each aliphatic group, (2) contacting said amine-containing sour naphtha with (i) an aqueous treating agent consisting essentially of water, caustic and alkylphenols, said agent containing at least about 5 weight percent of free caustic, at least about 2 volume percent of alkylphenols and no plumbite, said agent being present in an amount between about 10 and 200 volume percent, based on said amine-containing sour naphtha, (ii) free oxygen in an amount between about 0.2 and 2 standard cubic feet per barrel of said amine-containing sour naphtha and (iii) free sulfur in an amount to render said amine-containing sour naphtha essentially sweet to the Doctor test, (3) maintaining the contents of said contacting zone of step 2 at a temperature between about 80° F. and about 200° F. for a time at least sufficient to convert essentially all the mercaptans in the sour naphtha and to produce an essentially sweet naphtha and (4) separating an essentially sweet amine-containing naphtha from aqueous agent.

---

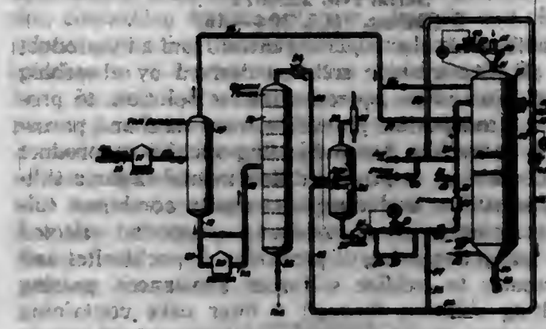


**2,771,404**
**PETROLEUM REFINING**
James L. Jezl, Swarthmore, and Abraham Schneider, Philadelphia, Pa., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application August 5, 1954, Serial No. 448,110
12 Claims. (Cl. 196—32)

1. Method for regenerating an alkaline treating agent which has been used to treat mineral oil containing objectionable sulfur compounds which comprises: contacting said treating agent with an epoxy compound added subsequent to the treatment of mineral oil and having the formula:

where R is selected from the group consisting of hydrogen, halogen radicals, hydrocarbon radicals having 1 to 5 carbon atoms, hydrocarbyloxyalkyl radicals, and

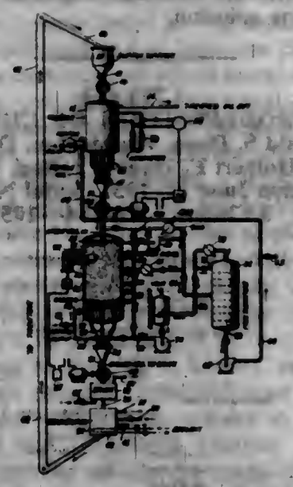
radicals, and where R', R'', and R''' are each selected from the group consisting of hydrogen, hydrocarbon radicals having 1 to 5 carbon atoms, and halogen radicals, the amount of said epoxy compound and the time of said contacting being sufficient to provide substantial conversion by the epoxy compound of reaction products of said sulfur compounds with constituents of said treating agent.



---

**2,771,405**
**REDUCTION OF COPPER CORROSIVITY OF SWEET OILS**
Mathew L. Kalinowski and John A. Bolt, Chicago, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
No Drawing. Application March 12, 1954, Serial No. 415,947
9 Claims. (Cl. 196—32)

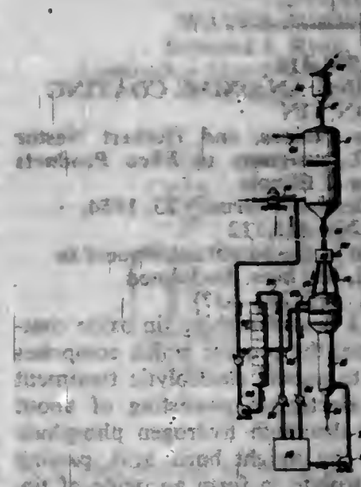
1. A process for improving the copper corosivity of a doctor sweetened oil which comprises (1) intimately contacting a sour petroleum distillate boiling in the heavier-than-gasoline range with doctor solution and with free-sulfur in an amount sufficient to sweeten said distillate, at a temperature between about 60° and 175° F., for a time sufficient to substantially sweeten said distillate, (2) separating said substantially sweet distillate from doctor solution, (3) contacting said substantially sweet distillate with water soluble alkanolamine agent in an amount sufficient to form separate distillate and alkanolamine phases, at a temperature between about 60° and about 150° F., for a time between about 15 minutes and 90 minutes and (4) separating a sweet distillate of improved copper corrosivity from an alkanolamine agent phase.



**2,771,406**
**METHOD AND APPARATUS FOR SUPPLYING LIQUID CHARGE TO HYDROCARBON REACTORS**
Frederick E. Ray, Glen Rock, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application May 25, 1953, Serial No. 357,292
13 Claims. (Cl. 196—52)

3. A process for continuously supplying liquid hydrocarbon charge to a reaction bed of hot solid contact material maintained within a confined reaction zone at a temperature above the temperature at which the hydrocarbon charge undergoes thermal conversion with resultant deposition of coke, which comprises: passing hydrocarbon charge to a phase separator and separating the charge therein into a liquid hydrocarbon charge fraction and a vapor hydrocarbon charge fraction, passing the liquid charge fraction into one side of a liquid manifold embedded within the reaction bed of contact material, injecting a portion of the liquid charge fraction from the manifold into the reaction bed, removing the remaining portion of the liquid charge fraction from the opposite side of the manifold and returning said remaining portion to the phase separator, and controlling the temperature of the liquid charge within the manifold below the temperature at which substantial thermal conversion occurs by controlling the temperature of supply of hydrocarbon charge to the phase separator and the residence time of the liquid in the manifold.

---



**2,771,407**
**CONTINUOUS PERCOLATION PROCESS**
Joe E. Penick, Augusta, Kans., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application November 19, 1952, Serial No. 321,373
15 Claims. (Cl. 196—147)

1. In a continuous cyclic process for decolorization of mineral oils wherein a fresh mineral oil feed is passed upwardly through a columnar mass of gravitating adsorbent of palpable particulate form in a confined treating zone at a rate and elevated temperature adjusted for effecting the decolorization of the oil without disruption of the columnar mass due to the oil flow therethrough and wherein the spent adsorbent bearing carbonaceous contaminant including color bodies and cycle oil is subjected to washing for removal of the cycle oil with a suitable washing solvent capable of also removing substantial amounts of the color bodies from the spent adsorbent when contacted therewith at the elevated treating temperature and wherein the washed adsorbent is dried, regenerated by burning, cooled and recycled to the treating zone for resuse, the improvement which comprises, withdrawing the spent adsorbent bearing carbonaceous contaminant including color bodies and a substantial amount of cycle oil from the lower section of said treating zone, still at an elevated temperature near said treating temperature, cooling the adsorbent to a temperatuer level below that at which said solvent will remove substantial amounts of the color bodies therefrom and then passing the adsorbent downwardly as a columnar mass countercurrently to a stream of said solvent in a confined washing zone so as to effect removal of the cycle oil from the adsorbent while leaving the color bodies and carbonaceous contaminant on the spent washed adsorbent, withdrawing the solvent and removed oil from the upper section of said washing zone and subjecting the same to fractionation to separate the solvent from the oil, leaving a recycle oil having a color not substantially darker that that of the fresh mineral oil feed to the treating zone and recycling said oil to said treating zone along with the fresh mineral oil feed, the aforesaid cooling of said adsorbent being effected at least in a part sufficient to reduce the adsorbent from a substantially higher treating temperature to a temperature below the boiling temperature of said washing solvent by passing a cooling fluid from a location of heat extraction other than said washing zone and comprised to at least a substantial extent of wash solvent of the same type as that supplied to said washing zone into direct contact with said hot, spent adsorbent in a region where the adsorbent is freely flowing downwardly to effect rapid cooling of the adsorbent before it reaches said columnar mass in said washing zone.

---

**2,771,408**
**METHOD FOR WASHING ADSORBENTS**
Joe E. Penick, Augusta, Kans., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application November 19, 1952, Serial No. 321,371
7 Claims. (Cl. 196—147)

1. A continuous process for washing hot, spent adsorbent of palpable particulate form, having been used for purifying liquid hydrocarbon oils and bearing car-

bonaceous contaminants, color bodies and cycle oil, which comprises: maintaining a downwardly gravitating columnar mass of adsorbent within the lower section of a confined washing zone, maintaining a column of liquid solvent of sufficient height to disengage adsorbent from the liquid solvent above said columnar mass within the upper section of the washing zone, passing cool washing solvent upwardly through said columnar mass to remove cycle oil from the adsorbent therein, passing washing solvent after passage through the columnar mass upwardly through said liquid column, introducing additional cool washing solvent at an intermediate level in said liquid column, passing a plurality of streams of hot, spent adsorbent downwardly through the liquid column and in heat exchange relationship therewith to effect cooling of the adsorbent and vaporize a portion of the solvent, discharging said streams of adsorbent onto the upper surface of said columnar mass, removing liquid solvent from the upper section of said column, maintaining the adsorbent streams out of lateral communication with that portion of the liquid solvent column from which liquid solvent is removed during that portion of the heat exchange wherein solvent is vaporized, removing vaporized solvent from the upper section of said zone at a level above the upper surface of said column, and removing washed adsorbent from the lower section of said columnar mass.

---

2,771,409

## METHOD OF MAKING GRID BEARINGS

Charles T. Cross, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application February 19, 1953, Serial No. 337,768
7 Claims. (Cl. 204—35)

1. A method of forming a grid bearing which comprises the steps of depositing silver onto a backing member, applying a thin coating of tin to the silver, forming a tin-silver alloy diffusion zone by heat treatment, die forming a multiplicity of grid pits in the resulting surface, filling said grid pits with a soft bearing material, and thereafter removing a portion of said diffusion zone and soft bearing material.

---

2,771,410

## METHOD OF FORMING AN OXIDE COATING ON TIN

John James Russell, Des Plaines, and Herbert Nestor Headland, Chicago, Ill., assignors to Ekco Products Company, a corporation of Illinois

No Drawing. Application February 23, 1954, Serial No. 412,112
The portion of the term of the patent subsequent to August 31, 1971, has been disclaimed
4 Claims. (Cl. 204—37)

1. In the formation of a heat absorbing tin oxide coating on a tin surface article, the process which comprises subjecting the tin article to anodic electrolytic treatment in an aqueous alkaline electrolyte consisting of about 1.5% to 12% by weight disodium hydrogen phosphate and about 1.5% to 12% by weight boric acid, passing current through said electrolyte to form an oxide of tin, removing the oxidized tin article from the electrolyte and then subjecting the anodized article to an elevated temperature from about 180° C. to 230° C. to convert said oxide to green oxide of tin.

2,771,411

## CYANIDE COMPOSITIONS SUITABLE FOR ELECTROPLATING BATHS AND METHOD FOR THE PREPARATION THEREOF

Allen E. Chester, Highland Park, Ill., and Joseph T. Irwin, Lakewood, Ohio, assignors to Poor & Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application May 10, 1951, Serial No. 225,671
9 Claims. (Cl. 204—46)

1. A method for electroplating metal from a by-product aqueous alkaline cyanide solution derived by absorbing coke oven gases in an aqueous alkaline solution, to produce an electrodeposited plate free from stain and porosity, which comprises first subjecting such a by-product solution containing as produced detrimental organic substances and sulfur, including organically combined sulfur, to treatment with an oxidizing compound selected from the group consisting of peroxides, hypochlorites and permanganates to oxidize sulfurous substances, passing the resulting solution through a filter cake containing activated carbon, thereby removing detrimental substances from said by-product solution, providing a metal platable from an alkaline cyanide bath in the resulting purified by-product solution in a soluble form, and electroplating said metal from the resulting plating solution.

---

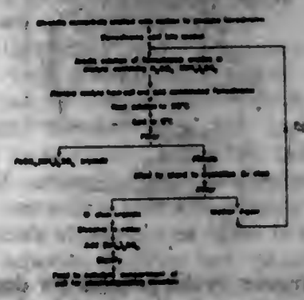
2,771,412

## CYANIDE COMPOSITIONS SUITABLE FOR ELECTROPLATING BATHS AND METHOD FOR THE PREPARATION THEREOF

Allen E. Chester, Highland Park, Ill., and Joseph T. Irwin, Lakewood, Ohio, assignors to Poor & Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application May 4, 1951, Serial No. 224,661
6 Claims. (Cl. 204—46)

1. A method for electroplating metal from a by-product aqueous alkaline cyanide solution derived by absorbing coke oven gases in an aqueous alkaline solution, to produce an electrodeposited plate free from stain and porosity, which comprises first subjecting such a by-product solution containing as produced detrimental organic substances and sulfur, including organically combined sulfur, to treatment with an alkali soluble inorganic compound of a metal selected from the group consisting of lead, copper, cadmium, and bismuth to precipitate sulfurous substances, passing the resulting solution through a filter cake containing activated carbon, thereby removing detrimental substances from said by-product solution, providing a metal platable from an alkaline cyanide bath in the resulting purified by-product solution in a soluble form, and electroplating said metal from the resulting plating solution.



---

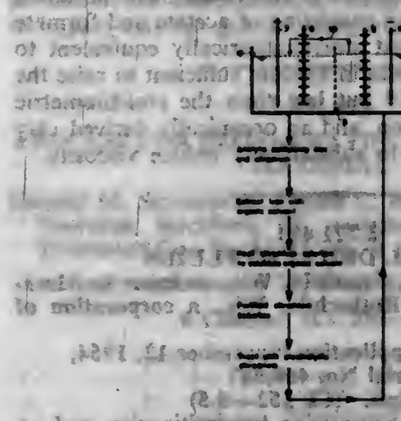
2,771,413

## ELECTRODEPOSITION OF CHROMIUM

Reginald S. Dean, Washington, D. C., and Holbert E. Dean, Crafton, Pa.

Application June 27, 1951, Serial No. 233,786
3 Claims. (Cl. 204—105)

1. The method of producing from chromite ores and the like, a solution suitable for electrodepositing chromium, which comprises smelting the ore with carbon to form an alloy of iron, chromium and carbon and a slag containing most of the other ingredients of the ore, separating the alloy from the slag, casting the alloy into thin slabs which cool rapidly, dissolving the cast alloy by making it an anode in a solution of sulphuric acid and ammonium sulphate under conditions to form a solution containing ferrous sulphate, chromic and chromous sulphates, adding ferrochrome to adjust the pH of the solution to 1–3 and to reduce the iron to the ferrous state, heating said solution having a pH of 1–3 to a temperature sufficient to stabilize the chromium in the green chromic modification, then cooling said solution to crystallize a ferrous ammonium sulphate product, removing said ferrous ammonium sulphate product from the solution, crystallizing and removing ammonium chromic sulphate from its mother liquor, and redissolving the ammonium chromic sulphate.



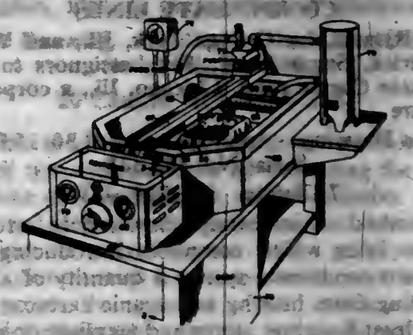
---

2,771,414

## METHOD OF MAKING ELECTROLYTIC CHROMIUM

Reginald S. Dean, Washington, D. C.

Application June 27, 1951, Serial No. 233,785
5 Claims. (Cl. 204—105)



1. The method of making electrolytic chromium from an iron-chromium-carbon alloy, which comprises making such alloy an anode in the anode compartment of a compartment cell separated by an ion-permeable diaphragm and having an insoluble cathode in the cathode compartment, said anode compartment having an electrolyte containing hydrochloric acid and at least one chloride selected from the class consisting of alkali metal chlorides, ammonium chloride, and alakline earth metal chlorides, said cathode compartment having an electrolyte containing hydrochloric acid, chromium chloride and at least one of the aforesaid chlorides, passing a unidirectional current through said cell from said anode to said cathode whereby to dissolve the alloy at the anode and deposit electrolytic chromium at the cathode, withdrawing from the cell the anolyte containing the metals, including iron, dissolved from the anode, extracting the iron from said withdrawn anolyte at a pH of 1–3 by a volatile organic solvent containing at least 80% ketone, said withdrawn anolyte containing chloride from said class in an amount sufficient to render said organic solvent at least partially immiscible with said withdrawn anolyte, removing dissolved solvent from the solution by evaporation and using the so treated solution as the electrolyte in the cathode compartment for the deposition of chromium, and then using the solution so depleted of chromium for the electrolyte in the anode compartment whereby to replenish the chromium content thereof.

2,771,415

## ELECTROLYTIC APPARATUS

Aylmer O. Ross, York, Pa., assignor to The National Electroform Mold Co., Baltimore, Md., a corporation of Maryland

Application October 28, 1952, Serial No. 317,229
4 Claims. (Cl. 204—238)

1. An electrolytic apparatus for electroforming of a metal product, comprising, a tray for containing an electrolyte, a sump for containing excess electrolyte, conduit means located between said sump and tray, means for pumping said electrolyte through said conduit means, nozzle means cooperating with said conduit means for continuously and uniformly introducing said electrolyte into said tray from the top thereof, an electric circuit including an anode element and a cathode contact element, a source of electric power for said circuit, and a non-conducting basket arrangement for containing the metal to be electrodeposited to form said metal product, said arrangement including at least top and bottom sections, a first pin means for holding said sections together, said top section including at least two spaced sidewalls, said bottom section being formed of spaced members arranged in alignment with said sidewalls of said top section, said members defining a space for accommodating said cathode contact element and the product to be electroformed, said top section having a plurality of spaced truss members for interconnecting said sidewalls, a second pin means positioned on said top section, and screening means supported by said second pin means and resting against said plurality of spaced truss members, said anode element being positioned on top of said screening means and arranged to support the metal to be electrodeposited, said screening means being utilized to screen impurities from the electrolyte during the electroforming of said metal product.

## WATER PURIFICATION

Edmund J. Ryan, Miami, Fla.

Application March 6, 1950, Serial No. 147,923
23 Claims. (Cl. 210—16)

1. The method of purifying water comprising passing into the water a gas comprising a halogen activated polymeric oxygen, said polymeric oxygen consisting essentially of gas which has been polymerized by treating the same under conditions to convert a substantial proportion of the oxygen to ozone and higher polymerized

forms of oxygen, and being halogen activated by contact of the polymeric oxygen gas with elemental halogen and salts thereof.

---

2,771,417

## INHIBITION OF CORROSION IN RETURN STEAM CONDENSATE LINES

John W. Rymer, La Grange Park, Ill., and Willard H. Kirkpatrick, Sugar Land, Tex., assignors to National Aluminate Corporation, Chicago, Ill., a corporation of Delaware

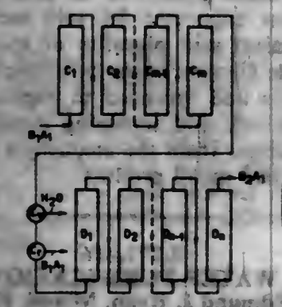
No Drawing. Application April 30, 1952, Serial No. 285,322

7 Claims. (Cl. 210—23)

1. A method of inhibiting corrosion in return steam condensate lines which comprises introducing into the return steam condensate system a quantity of a composition resulting from heating an organic carboxy acid containing at least 8 carbon atoms and an aliphatic polyamine containing at least two amino groups from the group consisting of primary and secondary amino groups, at a temperature of at least 115° C. and the elimination of an aqueous distillate, the proportions of said carboxy acid being sufficient to acylate at least one mol of nitrogen in said polyamine and the molar ratio of nitrogen in the amino groups to carboxy in the organic carboxy acid being within the range of 4:1 to 1:2, said quantity being sufficient to inhibit corrosion in said steam condensate system.

---

2,771,418



## PROCESS OF CONVERTING SUBSTANCES IONIZED IN SOLUTION, WITH THE HELP OF ION EXCHANGERS

Johannes A. Zeegers, Sittard, Netherlands, assignor to Stamicarbon N. V., Heerlen, Netherlands

Application October 15, 1952, Serial No. 314,832

Claims priority, application Netherlands October 24, 1951

5 Claims. (Cl. 210—24)

1. In a process for regenerating an ion-exchanger by passing a solution of a regenerating agent successively through a series of columns containing the ion-exchanger loaded with the ion to be replaced, wherein the series of columns is divided into a first group and a second group, and periodically the first column of said first group containing a regenerated ion-exchanger is removed from the series, the first column of said second group is made the last column of said first group, and a new column containing untreated ion-exchanger loaded with the ion to be replaced is connected at the end of said series, the improvement which comprises passing an excess of said regenerating agent through said first group, removing an amount of said regenerating agent substantially equal to that originally present as excess from the effluent discharged from said first group, and thereafter passing said effluent free from excess regenerating agent through said second group whereby a solution of spent, substantially completely converted regenerating agent is withdrawn from the last column of said series.

2,771,419

## AQUEOUS STARCH-CONTAINING DRILLING MUDS HAVING A REDUCED FILTRATION RATE

Richard A. Salathiel, Houston, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware

No Drawing. Application August 15, 1955, Serial No. 528,541

4 Claims. (Cl. 252—8.5)

1. A drilling mud comprising at least 5% by weight of finely divided solids and water having about 2 to 15 percent by weight of salt dissolved therein to which has been added amounts of starch and glyoxal sufficient to substantially reduce the water filtration loss rate of said drilling mud, said drilling mud containing from about 0.5 to 5 pounds of glyoxal and about 1 to 15 pounds of starch per 42-gallon barrel of drilling mud.

---

2,771,420

## DRILLING FLUID

David A. Rowe, Houston, Tex., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Application February 24, 1953, Serial No. 338,591

14 Claims. (Cl. 252—8.5)

1. A drilling fluid comprising an aqueous dispersion of hydratable clay in which the following have been incorporated: calcium ions in sufficient amount to convert the clay substantially into its calcium base form, an anion selected from the group consisting of acetate and formate ions in amount at least stoichiometrically equivalent to the calcium, caustic soda in amount sufficient to raise the pH value to above 10 but less than the stoichiometric equivalent of said anion, and an organically derived clay dispersant in amount to substantially reduce viscosity.

---

2,771,421

## OIL WELL DRILLING FLUIDS

William C. Browning, Schofield, Wis., assignor to Marathon Corporation, Rothschild, Wis., a corporation of Wisconsin

No Drawing. Application November 12, 1954, Serial No. 468,587

3 Claims. (Cl. 252—8.5)

1. A drilling fluid comprising bentonitic clay and an agent for controlling the viscosity and gel characteristics of the drilling fluid, said agent being an aluminum lignosulfonate complex wherein the aluminum is present in anionic and cationic form, said agent being made by treating basic calcium lignosulfonate with aluminum sulfate, then with a solution of an organic acid selected from the group consisting of oxalic, acetic, formic, lactic and tartaric acid having the property of replacing lignosulfonate in the aluminum complex, filtering said reaction mixture and drying the filtrate.

---

2,771,422

## POLYMETHYLPOLYSILOXANE THICKENED PHENYLMETHYL SILICONE OIL

George V. Browning, Schenectady, N. Y., and Cecil G. Brannen, Munster, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application April 29, 1952, Serial No. 285,089

5 Claims. (Cl. 252—49.6)

1. The method of preparing a homogeneous thermally stable organo-silicone polymer grease consisting essentially of a thermally stable organo-silicone polymer having a viscosity in the lubricating oil range of from about 10 to about 600 centistokes at 100° F. thickened to grease consistency with a gelled polymethylpolysiloxane, comprising mixing from about 40% to 98% of a liquid polymethylpolysiloxane substantially free of unreacted —OH groups with from about 2% to about 60% of a liquid organo-silicone polymer, other than said polymethylpolysiloxane, thermally stable at temperatures up to about 550° F. and having a viscosity in the lubricating oil range of from about 10 to about 600 centistokes at 100° F., heating said mixture to a temperature in the range of from about 400° F. to about 550° F. for a period of from about 1 hour to about 72 hours to form a gelled mixture, and milling the resultant gelled mixture with a sufficient amount of a thermally stable organo-silicone polymer having a viscosity in the lubricating oil viscosity range of from about 10 to about 600 centistokes at 100° F. to form a homogeneous grease containing from about 10% to about 80% of said gelled mixture.

---

2,771,423

## EXTREME PRESSURE LUBRICANTS CONTAINING DIESTERS OF CHLORENDIC ACID

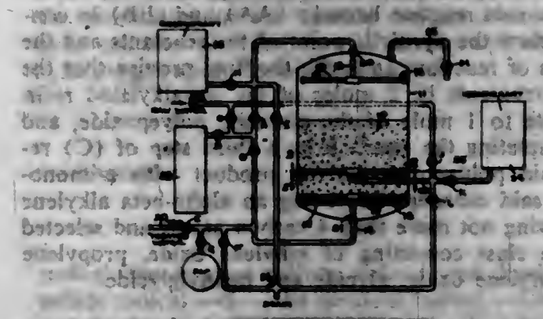
Amos Dorbeson, Park Forest, Ill., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine

No Drawing. Application July 28, 1955, Serial No. 526,981

2 Claims. (Cl. 252—54.6)

1. A metal-working oil composition consisting essentially of mineral oil and a diester of chlorendic acid in which the ester groups contain from 4 to 8 carbon atoms; the amount of diester present constituting about 10 to 75 percent of the composition by weight and being sufficient to impart extreme pressure properties to the composition.

---



2,771,424

## PROCESS FOR REGENERATING ION EXCHANGE MATERIAL

Donald M. Stronquist, August C. Reents, and Marvin E. Vermum, Rockford, Ill., assignors to Illinois Water Treatment Co., Rockford, Ill., a corporation of Illinois

Application August 25, 1949, Serial No. 112,352

6 Claims. (Cl. 252—182)

1. In the process of regenerating a mixed-bed column of anion-exchange and cation exchange materials of different densities, the steps of backwashing the exhausted mixed bed upwardly through the column to stratify the bed into an upper layer of the lighter of said exchange materials and a lower layer of the heavier material, regenerating the upper one of said exchange layers by passing a regenerating solution therefor downwardly through the layer, passing water upwardly through said lower layer while said regenerating solution is being passed down through said upper layer whereby to block substantial migration of the regenerating solution into the lower layer, withdrawing from the stratified column the mixture of said regenerant and water as the two meet near the inner ends of said layers, and thereafter passing water downwardly through the upper layer as the upward flow of water through the lower layer and withdrawal of the combined volumes of liquids from the intermediate part of said column is continued.

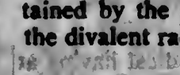
## PROCESS FOR BREAKING PETROLEUM EMULSIONS EMPLOYING CERTAIN OXYALKYLATED POLYEPOXIDE-TREATED AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS

Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

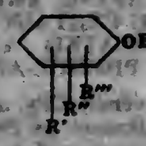


No Drawing. Application June 26, 1953, Serial No. 364,501

20 Claims. (Cl. 252—338)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier, said demulsifier being obtained by a 3-step manufacturing method involving (1) condensation; (2) oxyalkylation with a polyepoxide; and (3) oxyalkylation with a monoepoxide; said first manufacturing process being a step of (A) condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of tri-functional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) a basic nonhydroxylated secondary monoamine having not more than 32 carbon atoms in any group attached to the amino nitrogen atom, and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat stable and oxyalkylation-susceptible; followed as a second step by (B) reacting said resin condensate with a phenolic polyepoxide free from reactive functional groups other than epoxy and hydroxyl groups and cogenerically associated compounds formed in the preparation of said polyepoxides; said epoxides being monomers and low molal polymers not exceeding the tetramers; said polyepoxides being selected from the class consisting of (*aa*) compounds where the phenolic nuclei are directly joined without an intervening bridge radical, and (*bb*) compounds containing a radical in which 2 phenolic nuclei are joined by a divalent radical selected from the class consisting of ketone residues formed by the elimination of the ketonic oxygen atom and aldehyde residues obtained by the elimination of the aldehyde oxygen atom, the divalent radical



the divalent

radical, the divalent sulfone radical, and divalent monosulfide radical —S—, the divalent radical —CH₂SCH₂—, and the divalent disulfide radical —S—S—; said phenolic

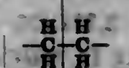
portion of the polyepoxide being obtained from a phenol of the structure

in which R', R'', R''' represent a member of the class consisting of hydrogen and hydrocarbon substituents of the aromatic nucleus, said substituent member having not over 18 carbon atoms; with the further proviso that said reactive amine-modified resin condensates (AA) and aryl polyepoxides (BB) be members of the class consisting of non-thermosetting organic solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of oxyalkylation- and acylation-susceptible solvent-soluble liquids and low-melting solids; said reaction between (AA) and (BB) be conducted below the pyrolytic point of the reactants and the resultants of reaction; and with the final proviso that the ratio of reactants be 2 moles of the oxyalkylated resin condensate to 1 mole of the phenolic polyepoxide, and then completing the reaction by a third step of (C) reacting said polyepoxide-derived product with a monoepoxide; said monoepoxide being an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.

---

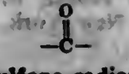
2,771,426

## PROCESS FOR BREAKING PETROLEUM EMULSIONS EMPLOYING CERTAIN OXYALKYLATED POLYEPOXIDE-TREATED AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS



Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 26, 1953, Serial No. 364,502
20 Claims. (Cl. 252—336)



1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier, said demulsifier being obtained by a 3-step manufacturing method involving (1) condensation; (2) oxyalkylation with a polyepoxide; and (3) oxyalkylation with a monoepoxide; said first manufacturing process being a step of (A) condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage, phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and an aldehyde having not over 8 carbon atoms and in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) a basic hydroxylated secondary monoamine having not more than 32 carbon atoms in any group attached to the amino nitrogen atom, and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat stable and oxyalkylation-susceptible; followed as a second step by (B) reacting said resin condensate with a phenolic polyepoxide free from reactive functional groups other than epoxy and hydroxyl groups and cogenerically associated compounds formed in the preparations of said polyepoxides; said epoxides being monomers and low molal polymers not exceeding the tetramers; said polyepoxides being selected from the class consisting of (*aa*) compounds where the phenolic nuclei are directly joined without an intervening bridge radical, and (*bb*) compounds containing a radical in which 2 phenolic nuclei are joined by a divalent radical selected from the class consisting of ketone residues formed by the elimination of the ketonic oxygen atom and aldehyde residues obtained by the elimination of the aldehyde oxygen atom, the divalent radical

the divalent

radical, the divalent sulfone radical, and divalent monosulfide radical —S—, the divalent radical —$CH_2SCH_2$—, and the divalent disulfide radical —S—S; said phenolic portion of the polyepoxide being obtained from a phenol of the structure

in which R', R'', and R''' represent a member of the class consisting of hydrogen and hydrocarbon substituents of the aromatic nucleus, said substituent member having not over 18 carbon atoms; with the further proviso that said reactive amine-modified resin condensate (AA) and aryl polyepoxides (BB) be members of the class consisting of non-thermosetting organic solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of oxyalkylation- and acylation-susceptible solvent-soluble liquids and low-melting solids; said reaction between (AA) and (BB) be conducted below the pyrolytic point of the reactants and the resultants of reaction; and with the final proviso that the ratio of reactants be 2 moles of the oxyalkylated resin condensate to 1 mole of the phenolic polyepoxide, and then completing the reaction by a third step of (C) reacting said polyepoxide-derived product with a monoepoxide; said monoepoxide being an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.

## PROCESS FOR BREAKING PETROLEUM EMULSIONS EMPLOYING CERTAIN OXYALKYLATED POLYEPOXIDE-TREATED AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS

Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application June 26, 1953, Serial No. 364,503
20 Claims. (Cl. 252—336)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier, said demulsifier being obtained by a 3-step manufacturing method involving (1) condensation; (2) oxyalkylation with a polyepoxide; and (3) oxyalkylation with a monoepoxide; said first manufacturing process being a step of (A) condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2, 4, 6 position; (*b*) a basic nonhydroxylated polyamine having at least one secondary amino group and having not over 32 carbon atoms in any radical attached to any amino nitrogen atom, and with the further proviso that the polyamine be free from any primary amino radical, any substituted imidazoline radical, and any substituted tetrahydropyrimidine radical; and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat stable and oxyalkylation-susceptible; followed as a second step by (B) reacting said resin condensate with a phenolic polyepoxide free from reactive functional groups other than epoxy and hydroxyl groups and cogenerically associated compounds formed in the preparation of said polyepoxides; said epoxides being monomers and low molal polymers not exceeding the tetramers; said polyepoxides being selected from the class consisting of (*aa*) compounds where the phenolic nuclei are directly joined without an intervening bridge radical, and (*bb*) compounds containing a radical in which 2 phenolic nuclei are joined by a divalent radical selected from the class consisting of ketone residues formed by the elimination of the ketonic oxygen atom and aldehyde residues obtained by the elimination of the aldehyde oxygen atom, the divalent radical

the divalent

radical, the divalent sulfone radical, and divalent monosulfide radical —S—, the divalent radical —$CH_2SCH_2$—, and the divalent disulfide radical —S—S—; said phenolic portion of the polyepoxide being obtained from a phenol of the structure

in which R', R'', and R''' represent a member of the class consisting of hydrogen and hydrocarbon substituents of the aromatic nucleus, said substituent member having not over 18 carbon atoms; with the further proviso that said reactive amine-modified resin condensates (AA) and aryl polyepoxides (BB) be members of the class consisting of non-thermosetting organic solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of oxyalkylation- and acylation-susceptible solvent-soluble liquids and low-melting solids; said reaction between (AA) and (BB) be conducted below the pyrolytic point

of the reactants and the resultants of reaction; and with the final proviso that the ratio of reactants be 2 moles of the oxyalkylated resin condensate to 1 mole of the phenolic polyepoxide, and then completing the reaction by a third step of (C) reacting said polyepoxide-derived product with a monoepoxide; said monoepoxide being an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.

## PROCESS FOR BREAKING PETROLEUM EMULSIONS EMPLOYING CERTAIN POLYEPOXIDE TREATED DERIVATIVES OBTAINED BY REACTION OF MONOEPOXIDES WITH RESINS

Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

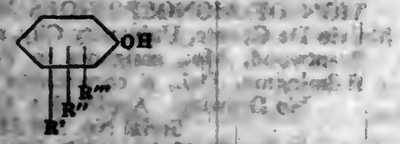
No Drawing. Application April 22, 1953, Serial No. 350,535
20 Claims. (Cl. 252—338)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier; said demulsifier being obtained by a three-step manufacturing process involving (1) condensation; (2) oxyalkylation with a monoepoxide; and (3) oxyalkylation with a polyepoxide; said first manufacturing step being a method of (A) condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) cyclic amidines selected from the class consisting of substituted imidazolines and



substituted tetrahydropyrimidines in which there is present at least one basic secondary amino radical and characterized by freedom from any primary amino radical; and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat stable and oxyalkylation-susceptible; followed as a second step by (B) oxyalkylation by means of an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide; and then completing the reaction by a third step of (C) reacting said oxyalkylated resin condensate with a phenolic polyepoxide free from reactive functional groups other than epoxy and hydroxyl groups and cogenerically associated compounds formed in the preparation of said polyepoxides; said epoxides being monomers and low molal polymers not exceeding the tetramers; said polyepoxides being selected from the class consisting of (*aa*) compounds where the phenolic nuclei are directly joined without an intervening bridge radical, and (*bb*) compounds containing a radical in which 2 phenolic nuclei are joined by a divalent radical selected from the class consisting of ketone residues formed by the elimination of the ketonic oxygen atom, and aldehyde residues obtained by the elimination of the aldehyde oxygen atom, the divalent radical

the divalent

radical, the divalent sulfone radical, and divalent monosulfide radical —S—, the divalent radical —$CH_2SCH_2$— and the divalent disulfide radical —S—S—; said phenolic portion of the polyepoxide being obtained from a phenol of the structure

in which R', R'', and R''' represent a member of the class consisting of hydrogen and hydrocarbon substituents of the aromatic nucleus, said substituent member having not over 18 carbon atoms; with the further proviso that said reactive monoepoxide-derived compounds (AA) and aryl polyepoxides (BB) be members of the class consisting of non-thermosetting organic solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of solvent-soluble liquids and low-melting solids; said reaction between (AA) and (BB) be conducted below the pyrolytic point of the reactants and the resultants of reaction; and with the final proviso that the ratio of reactants be 2 moles of the oxyalkylated resin condensate to 1 mole of the phenolic polyepoxide.

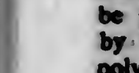
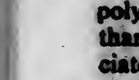
## PROCESS FOR BREAKING PETROLEUM EMULSIONS EMPLOYING CERTAIN POLYEPOXIDE TREATED AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS

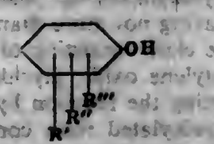


Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application February 24, 1953, Serial No. 338,573
20 Claims. (Cl. 252—338)



1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier, said demulsifier being obtained by first (A) condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula



in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) a basic nonhydroxylated secondary monoamine having not more than 32 carbon atoms in any group attached to the amino nitrogen atom, and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat-stable and oxyalkylation-susceptible; followed by (B) reacting said resin condensate with a phenolic polyepoxide free from reactive functional groups other than epoxy and hydroxyl groups and cogenerically associated compounds formed in the preparation of said polyepoxides; said epoxides being monomers and low molal polymers not exceeding the tetramers; said polyepoxides being selected from the class consisting of (*aa*) compounds where the phenolic nuclei are directly joined without an intervening bridge radical, and (*bb*) compounds containing a radical in which 2 phenolic nuclei are joined by a divalent radical selected from the class consisting of ketone residues formed by the elimination of the ketonic oxygen atom, and aldehyde residues obtained by the elimination of the ketonic oxygen atom, and aldehyde residues obtained by the elimination of the aldehyde oxygen atom, the divalent radical

the divalent

radical, the divalent sulfone radical, and the divalent monosulfide radical —S—, the divalent radical —$CH_2SCH_2$—, and the divalent disulfide radical —S—S—; said phenolic portion of the diepoxides being obtained from a phenol of the structure

in which R', R'', and R''' represent a member of the class consisting of hydrogen and hydrocarbon substituents of the aromatic nucleus, said substituent member having not over 18 carbon atoms; with the further proviso that said reactive compounds (A) and (B) be members of the class consisting of non-thermosetting organic solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of solvent-soluble liquids and low-melting solids; said reaction between (A) and (B) be conducted below the pyrolytic point of the reactants and the resultants of

reaction; and with the final proviso that the ratio of reactants be 2 moles of the resin condensate to 1 mole of the phenolic polyepoxide.

36 Claims. (Cl. 252—341)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier including the gluconic acid salts of the basic oxyalkylated products obtained in turn in the process of condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) a basic nonhydroxylated secondary monoamine having not more than 32 carbon atoms in any group attached to the amino nitrogen atom, and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat-stable and oxyalkylation-susceptible; followed by an oxyalkylation step by means of an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.

## PROCESS FOR BREAKING PETROLEUM EMULSIONS EMPLOYING GLUCONIC ACID SALTS OF OXYALKYLATED AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS

Melvin De Groote, University City, Mo., assignor to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application January 26, 1953, Serial No. 333,387
36 Claims. (Cl. 252—341)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier including the gluconic acid salts of the basic oxyalkylated products obtained in turn in the process of condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) a basic hydroxylated secondary monoamine having not more than 32 carbon atoms in any group attached to the amino nitrogen atom, and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat-stable and oxyalkylation-susceptible; followed by an oxyalkylation step by means of an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.

## PROCESS FOR BREAKING EMULSIONS

Melvin De Groote, University City, and Bernhard Keiser, Webster Groves, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application April 4, 1955, Serial No. 499,197
7 Claims. (Cl. 252—341)

1. A process for breaking petroleum emulsions of the water-in-oil type, characterized by subjecting the emulsion to the action of a demulsifier including a quaternary ammonium compound of the structure

in which ORO is the residue of the oxyethylated polypropyleneglycol

$$HO—(C_2H_4O)_x(C_3H_6O)_y(C_2H_4O)_{x'}—H$$

where $(C_3H_6O)_y$ equals approximately 40% to 60%, and $(C_2H_4O)_{x+x'}$ equals approximately 60% to 40% of the total weight of the compound, the molecular weight being within the range of approximately 2,000 to 6,000.

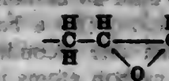
## PROCESS FOR BREAKING PETROLEUM EMULSIONS, CERTAIN OXYALKYLATED POLYEPOXIDE-TREATED AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS AND METHOD OF MAKING SAME



Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 30, 1953, Serial No. 371,410
20 Claims. (Cl. 252—344)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier, said demulsifier being obtained by a 3-step manufacturing method involving (1) condensation; (2) oxyalkylation with a polyepoxide; and (3) oxyalkylation with a monoepoxide; said first step being that of (A) condensing (*a*) an oxyalkylation-susceptible, fusible, nonoxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) a basic nonhydroxylated secondary monoamine having not more than 32 carbon atoms in any group attached to the amino nitrogen atom, and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat stable and oxyalkylation-susceptible; followed as a second step by (B) reacting said resin condensate with nonaryl hydrophile polyepoxides characterized by the fact that the precursory polyhydric alcohol, in which an oxygen-linked hydrogen atom is replaced subsequently by the radical

in the polyepoxide, is water-soluble; said polyepoxides being free from reactive functional groups other than epoxy and hydroxyl groups and characterized by the fact that the divalent linkage uniting the terminal oxirane rings is free from any radical having more than 4 uninterrupted carbon atoms in a single chain; with the further proviso that said reactive compounds (A) and (B) be members of the class consisting of non-thermosetting solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of acylation- and oxyalkylation-susceptible solvent-soluble liquids and low-melting solids; and said reaction between (A) and (B) being conducted below the pyrolytic point of the reactants and the resultants of reaction; and with the final proviso that the ratio of reactants be 2 moles of the resin condensate to 1 mole of the polyepoxide, and then completing the reaction by a third step of (C) reacting said polyepoxide-derived product with a monoepoxide; said monoepoxide being an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.
